PREFACE

THIS is the second of the series of year books forming annual supplements to the Encyclopædia Britannica; the first was launched last year and warmly received. It is hoped that this volume will prove as useful as its predecessor.

So rapidly have events moved in the last few months, and so closely have consequence and fulfilment trod on the heels of cause and prophecy, that the editors think it imperative to emphasize that this book is a contemporary survey of men and affairs during the year 1938. The closing scenes especially are depicted, not in retrospect and with foreknowledge of what was to come, but as they appeared at the time to the audience then witnessing the performance.

There are, on the other hand, some fields of human activity where changes and discoveries are of such slow growth, or require so much time and patience to bring to fruition, as to make it unsatisfactory to record the almost imperceptible alterations from year to year. The editors will therefore cover the entire range of such activities over a number of years; in each annual record summarizing the developments for several years in a selected portion of the field.

In conclusion, the editors venture to hope that they have succeeded in their efforts—never easy and this year more difficult than ever—to present an impartial, temperate, and factual record of the year under review, free from the passions and partizanships which the events naturally aroused. The measure of success achieved in this respect would have been impossible without willing support from individual contributors, to all of whom a tribute of most grateful thanks is offered for their tolerance, judgment, and unsparing expenditure of time and labour.

M. D. LAW.

INITIALS AND NAMES OF CONTRIBUTORS WITH THE PRINCIPAL ARTICLES WRITTEN BY THEM

A. A.	SIR ALGERNON ASPINALL, C.M.G., C.B.E. Secretary, the West India Committee, 1898–1938.	Bahamas; Barbados; Bermuda; Jamaica; etc. etc.
A. A. C.	ALBERT A. COCK, B.A. Vice-Principal of University College, Southampton, and Professor of Education and Philosophy there since 1919.	Education: General Trends; Education, Moral and Religious; etc.
A. A. M. D.	ARTHUR A. M. DURRANT, M.I.Mech.E., M.I.A.E., M.Inst.T. Chief Engineer for Omnibuses and Coaches, London Passenger Transport Board.	Motor Buses.
A. C. Cr.	ARTHUR CHARLES CROSS. Editor of *Petroleum World* and *Oil News*, London.	Petrol (*in part*).
A. C. E.	A. C. EWING, M.A., Litt.D. Lecturer in Moral Philosophy, Trinity Hall, Cambridge University, England.	Philosophy.
A. C. H.	A. C. HUDSON, M.A., M.D., F.R.C.S. Consulting Ophthalmic Surgeon and Lecturer in Ophthalmology, St. Thomas's Hospital, London; Consulting Surgeon, Royal London Ophthalmic Hospital.	Eye, Diseases of.
A. D.	A. DONKERSLOOT. Editor, *Critisch Bulletin*, Amsterdam, Holland.	Dutch Literature.
A. Fel.	ALFRED FELLOWS, B.A. Barrister at Law, Lincoln's Inn. Author of *The Home Lawyer*; *The Case Against the English Divorce Law*, etc.	Divorce (*in part*).
A. F. H.	SIR ARTHUR HURST, M.A., D.M., F.R.C.P. Senior Physician to Guy's Hospital. President of the International Society of Gastro-Enterology. Author of *Constipation and Allied Disorders*, etc. etc.	Alimentary System, Disorders of.
A. F. P.	A. PARRY Member of the staff of the Imperial Economic Committee, London.	Jute; Sisal, Hemp, and Cordage Fibres.
A. G. C.	ALFRED G. CUNNINGHAM. Commissioner of the Salvation Army, London.	Salvation Army (*in part*).
A. J. C. C.	A. J. C. COSBIE, B.Sc., A.C.G.I., A.I.C. Chief Chemist, Truman, Hanbury, Buxton & Company, Ltd., London; Lecturer in Brewing and Bottling at Sir John Cass Institute.	Brewing and Beer.
A. K. B.	A. K. BRYCESSON "Hotspur" of *The Daily Telegraph and Morning Post*; formerly sporting editor of *The Times*.	Horse Racing (*in part*).
A. M.	ALBERT MANSBRIDGE, C.H., M.A., LL.D. President of the World Association for Adult Education. Author of *University Tutorial Classes*; *An Adventure in Working Class Education*; etc.	Adult Education.
A. M. H.	ALBERT M. HYAMSON, O.B.E., F.R.Hist.S. Controller of Labour in the Government of Palestine, 1921–3. Director of Immigration, 1924–34. Author of *A History of the Jews in England*, etc.	Judaism, Orthodox.
A. Mn.	ARTHUR MERTON Egyptian Correspondent, *The Daily Telegraph and Morning Post*.	Anglo-Egyptian Sudan; Egypt; etc.

DIARY OF EVENTS

From January 1st, 1938—January 31st, 1939

1938

Jan. 1 · **United Kingdom.**—Royal assent was given to the Air Raid Precautions Act.

Sir Robert Vansittart was appointed to the new post of Chief Diplomatic Advisor in the Foreign Office.

France.—The French National Railway Company took over the whole railway system of France.

Estonia.—The new constitution came into force.

Rumania.—Parliament was dissolved by M. Goga, the Premier.

Sino-Japanese War.—General Chiang Kai-shek handed over the Premiership to Mr. H. Kung, Minister of Finance, in order to devote himself to his duties as Commander-in-Chief of the Chinese forces

Jan. 2: **United Kingdom.**—An official statement was made of gold holdings in the Exchange Equalization Account.

France.—The French Budget for 1938 was adopted in a final compromised form

Spanish Civil War.—Barcelona was raided by Nationalist bombers, 49 people being killed.

Sino-Japanese War.—The reported Japanese peace terms were unacceptable to the Chinese Government.

Jan. 3: **United Kingdom.**—Arabic broadcasts by the B.B.C. were inaugurated by H.H. the Emir Seif-ul-Islam Husain, son of the King of the Yemen.

Jewish Problems.—In London, British Zionist leaders unanimously opposed the enforcement of a permanent Jewish minority in Palestine, and supported proposals for a Jewish State to be brought within the British Empire.

United States.—Mr. Roosevelt outlined the internal policy and the general international situation.

Egypt.—Dr. Ahmed Maher, the President of the Chamber, was expelled from the Wafdist Party. A new Wafdist political group, the "Saadist Wafdist Party", was formed. The King prorogued Parliament.

Jan. 4: **Palestine.**—A White Paper clarified Britain's policy in Palestine.

Rumania.—Rumania's loyalty to treaties with France, Poland, the Balkan and Little Ententes was announced.

Sino-Japanese War.—Incidents in the International Settlement at Shanghai were followed by Japanese demands for extended control there.

Jan. 5: **United Kingdom.**—A committee was formed to simplify highway laws.

Rumania.—Representatives of the World Jewish Congress at Geneva protested against the growth of anti-semitism in Rumania

United States.—In his Budget Message to Congress, Mr. Roosevelt estimated a deficit of £190 millions. Defence appropriations totalled £197,724,000.

Germany.—A new Zeppelin airship was ordered.

Spanish Civil War.—A Government decree allowed thirty days for the civil population to leave Madrid.

Jan. 6 · **Spain.**—The "Institute of Spain", a new body to be the arbiter of intellectual and cultural life, was inaugurated at Salamanca

Rumania.—Rumania accorded a "de facto" recognition to the Italian Empire in East Africa

Sino-Japanese War.—Hangchow was subjected to Japanese bombing attacks.

Jan. 7 **Italy.**—A new naval building programme was adopted

United States.—Mr. Joseph P. Kennedy was appointed ambassador to Great Britain; Mr. Hugh R. Wilson, ambassador to Germany

Spanish Civil War.—Teruel fell entirely into government hands

Sino-Japanese War.—Japanese attacks on British police officers increased the tension in the International Settlement at Shanghai.

Jan 8: **Sudan.**—Under the terms of the Anglo-Egyptian Treaty, Egyptian troops re-entered the Sudan, whence they were withdrawn in 1924

Eire.—The Italian Empire in East Africa was accorded "de facto" recognition by Eire.

Jan. 9: **France.**—The Ministry of National Defence issued a decree increasing official control of war material.

Greece.—Prince Paul, Heir-Presumptive to the throne, was married at Athens to Princess Frederika of Hanover.

Jan 10: **Poland.**—General Skwarczynski succeeded Colonel Koc in the leadership of the "National Unity Camp".

Italy.—The text of the Treaty of Friendship between Italy and the Yemen was published in Rome

Soviet Union.—Several prelates of the Orthodox Church of Russia and other clergy were arrested on charges of "treason" and "subversive activities".

United States.—The House of Representatives rejected a proposed Constitutional amendment vesting in referendum the power to declare war in all cases save that of invasion.

Palestine.—The distinguished British archæologist, Mr. J. L. Starkey, fell victim to terrorist outrages.

Jan. 11 · **United Kingdom.**—The General Council of the Trade Union Congress considered the formation of a Trade Union for domestic servants.

Miss Margery Fry was appointed a Governor of the B.B.C. for five years.

Aviation.—The "Samoa Clipper" was wrecked in the Samoan Islands; seven perished.

Jan. 12: **Soviet Union.**—The Government requested parity of consular posts. The new Parliament met for the first time.

Rome Protocols.—Austria, Hungary, and Italy announced the continuance of a policy in accordance with the Rome Protocols.

Aviation.—Reduced postal charges on the England-India route came into force.

France.—M. Dornoy, the Minister of the Interior, made a public accusation against the "Comité Secret d'Action Révolutionnaire" (Cagoulards)

Jan. 13 · **Egypt.**—General Aziz Ali Pasha was appointed Inspector-General of the Army.

International Federation of Trade Unions.—Negotiations between the I.F.T.U. and the Russian Trade Unions for a "united front against war and fascism" broke down.

New Zealand.—A trade agreement was concluded with the Netherlands.

France.—A crisis in the French Cabinet followed M. Chautemps' criticism of his socialist supporters.

Jan. 14: **France.**—M. Chautemps handed in his Cabinet's resignation.

Jan 15: **Rugby Football.**—Wales beat England at Cardiff by 14–8

Soviet Union.—Government forbad payments to Italian firms.

Antarctic Research.—The principal geographical feature discovered by the British Graham Land Expedition was named King George VI Sound.

United Kingdom.—Mr. de Valera and three Irish Ministers visited London to confer on Anglo-Irish relationships.

Germany.—M. Stoyadinović, the Yugoslav Premier, visited Berlin.

Jan. 16 · **Rumania.**—Two petitions against the Rumanian Government's anti-semitic measures were received by the League Council.

International Federation of Trade Unions. At a joint meeting in Brussels a boycott of Japanese goods, while the Japanese forces occupied the Chinese Republic, was recommended.

Turkey.—A new Stock Exchange was created at Ankara; the Istanbul Exchange was closed.

Sino-Japanese War.—Prince Konoye declared that Japan would negotiate only with the Provisional Government at Peking.

Jan. 17: **United Kingdom.**—Anglo-Irish conversations began.

Soviet Union.—Mikhail Kalinin was re-elected to the Presidency; eleven vice-presidents, one from each republic of the Union, were also chosen.

Venezuela. A hitherto unknown waterfall (the highest in the world) was discovered in south-eastern Venezuela.

Jan. 18: **Rumania.**—Parliament was dissolved. Jews were forbidden to vote in the elections for the new Parliament.

France.—The Cabinet crisis was resolved, M. Chautemps forming a new administration.

Spanish Civil War.—Ten persons were killed during a Nationalist raid on Valencia.

United Kingdom.—The annual meeting of the National Farmers' Union opened.

United States.—Navy appropriation provided for the construction of two new battleships and twenty other warships.

Jan. 19: **Aviation.**—Twenty U.S. nava bombers completed the longest ocean

formation flight on record, from California to Hawaii.

Soviet Russia.—M Vlacheslav Molotoff formed a new Council of People's Commissars

United Kingdom.—The Convocation of Canterbury opened at Westminster Abbey, and the Convocation of York at St William's College, York

Jan. 20 **Egypt.**—The marriage of H M. King Farouk of Egypt with Mlle Farida Zulficar took place at the Koubbeh Palace in Cairo

United Kingdom.—Mr de Valera and his colleagues returned to Dublin

France.—Sixty-three persons were arrested in connexion with the "Cagoulard" conspiracy

Spanish Civil War.—A Nationalist raid on Barcelona caused sixty deaths. The British steamer "Thorpeness", at anchor in the harbour, was hit, and seven men were killed

Jan 21 **France.**—M. Chautemps' new government obtained the support of the Chamber of Deputies by 501 votes to 1.

Rumania.—The People's Party, led by General Averescu, was fused with the National Christian Party, with General Averescu and Professor Cuza as joint presidents Anti-semitic measures continued

Dec. 28 **Czechoslovakia.**—French interests in the Czech Skoda Works were sold to the Czechoslovak government.

Holland.—Eight bills concerned with emergency and war-time precautions were introduced

Spanish Civil War.—The British s.s "Stancroft" was sunk during a Nationalist air raid on Barcelona.

Italian troops reached Granadella.

Egypt.—The Anglo-Egyptian Treaty was upheld by the Chamber, and a Wafdist censure motion heavily defeated

Cricket.—The first Test Match between England and South Africa ended at Johannesburg in a draw.

Sino-Japanese War.—Japan's peace terms were unequivocally rejected by Marshal Chiang Kai-shek.

Dec. 29: **Iran.**—Diplomatic relations with France were broken off.

Turkey.—The President, Ismet Inönü, was elected leader for life of the Republican People's Party, the only political organization permitted.

Dec. 30: **Germany.**—The German government claimed a right under the Naval Agreements of 1935 and 1937 to more submarines and cruisers.

Spanish Civil War.—The Republican destroyer "Jose Luis Diaz" in attempting to leave Gibraltar was intercepted by Nationalists and was eventually interned at Gibraltar.

Dec. 31: **Poland.**—The Executive Council of the Ukrainian Undo Party decided to uphold Ukrainian demands for autonomy.

Australia.—The sixth World Jamboree of Scouts was opened at Bradfield, near Sydney.

United States.—A Note protesting against Japanese policy in China was issued by the United States.

Mr Roosevelt announced that there would be no change in the silver policy.

1939

Jan. 1: **China.**—The Kuomintang Executive Committee expelled Mr. Wang Ching from the Party and denounced his "peace movement".

France.—The Finance Bill was passed.

United States.—Extensive Stock Exchange reforms became effective.

Czechoslovakia.—Jewish teachers in German schools were compulsorily retired on pension

Germany.—The new Labour laws came into effect.

Jan 2 **Sino-Japanese War.**—The Japanese reoccupied Weichow Island in the Gulf of Tongking

France.—M Daladier began his tour of Corsica, Tunisia, and Algeria.

Eire and Northern Ireland.—A new Irish association was founded to promote co-operation between the people of Eire and Northern Ireland

Jan 3: **United States.**—A report recommending extensive improvement and enlargements of naval establishments on both the Pacific and Atlantic coasts was presented to Congress

Jan 4. **Japan.**—The Cabinet resigned.

Cricket.—The second Test Match at Capetown ended in a draw.

United States.—Mr. Roosevelt's speech to Congress urged national unity, and the defence of democracy.

Rumania.—The Statute of the Party of National Regeneration was promulgated by Royal decree.

Jan 5 · **Japan.**—Baron Hiranuma formed a new government.

United States.—The 1939-40 Budget showed a heavy deficit coupled with increased expenditure for national defence.

Prof. Felix Frankfurter of Harvard University was nominated as a Justice of the Supreme Court.

Jan 6: **Czechoslovakia.**—Fighting took place on the Hungarian frontier, in the neighbourhood of Munkacs.

Great Britain.—The Bank of England's monetary policy included the reimposition of foreign exchange embargos and £350 millions in gold was transferred to the Exchange Equalization Account. The fiduciary note issue was increased.

Jan 7: **Memel Territory.**—Herr Baldschus, President of the Directory since 1935, resigned.

Jan. 8 **Denmark.**—The Congress of the Danish Social Democratic Party was opened.

United States.—Thomas Mooney, the former Labour leader, was unconditionally pardoned and released after 22 years' imprisonment on a charge of complicity in a dynamite explosion in San Francisco on Preparedness Day in 1916.

Sweden and Finland.—Partial remilitarization of the Aland Islands was arranged on a co-operative basis.

Jan. 9: **Bulgaria.**—A German economic mission arrived at Sofia.

Sino-Japanese War.—The Chinese reoccupied Tsengchu, 50 miles east of Canton.

Jan. 10: **Great Britain.**—Proposals were formulated by different sections of the shipping industry to "secure the maintenance of the British Mercantile Marine in the face of severe and increasing foreign competition, largely State-aided or artificially fostered".

Jan. 11: **Italy.**—Mr Chamberlain and Lord Halifax arrived in Rome on an official visit.

Siam.—Recent expansions in naval rearmament will make Siam as strong as Australia and second only to Japan as a sea-power in the Orient.

Sino-Japanese War.—In an offensive thrust across the Yellow River from Shansi the Chinese captured several towns

Jan 12: **Wheat.**—The Wheat Advisory Committee meeting at Rome made plans for a world wheat conference to deal with over-production.

Great Britain.—The co-ordination of A R P work in Greater London was announced

Turkey.—Dr. Tewfick Rustu Aras was appointed Ambassador to Great Britain, in succession to M. Felhi Okyar.

United States.—Mr Roosevelt asked Congress for $525 millions defence appropriation, and an additional $27 millions for strengthening the Panama Canal Zone.

Canada.—The fourth session of the 18th Federal Parliament opened.

Jan. 13 **Hungary.**—Manchukuo was officially recognized by Hungary

The government accepted the formal invitation from German, Italian, and Japanese ministers to join the Anti-Comintern Pact.

Suez Canal.—The Suez Canal Company stated its opposition to Italy's claims.

Great Britain.—The Executive Committee of the Labour Party rejected Sir Stafford Cripps' "Popular Front" memorandum.

Jan. 14: **Antarctica.**—New territory in Antarctica was annexed by Norway.

Jan. 15: **Egypt.**—Cabinet changes followed the resignation of Hassan Sabry Pasha, Minister of War, and his replacement by Hussein Pasha Sirry, Minister of Public Works

Spanish Civil War.—Tarragona fell to the Nationalists

Jan. 16: **Belgium.**—The Belgian Cabinet appointed an agent to Burgos.

Great Britain.—Arrangements were completed for the supply of steel air-raid shelters to occupants of small houses.

A number of bomb outrages, believed to be the work of the Irish Republican Army, occurred in London and the provinces.

League of Nations.—The 104th Session of the League Council opened

Manchukuo.—The Prime Minister announced his country's adherence to the Anti-Comintern Pact.

Jan. 17: **Japan-Soviet Union.**—A deadlock was reached in the Fisheries Convention dispute.

France.—The "Richlieu", the biggest battleship of the French Navy, was launched.

Great Britain.—An auxiliary Air Force Reserve was formed.

Japan.—Companies were established by Japan for the economic development of Northern and Central China.

Sino-Japanese War.—Protests were made by Britain and France against Japanese policy in China.

Jan. 18: **Rumania.**—The Hungarian minority decided to join the Party of National Regeneration.

Great Britain.—Further bomb outrages occurred

Sino-Japanese War.—The Japanese occupied Fayun, north of Canton

Jan 19 **Yugoslavia.** Conversations between Count Ciano and Dr Stoyadinović opened in Belgrade

Brazil.—A Five-Year Plan of national defence and public works was inaugurated by the President

Germany.—The cruiser "Seydlitz" was launched at Bremen

Aden.—The centenary of British rule was celebrated.

Jan 20 **Memel Territory.**—Herr Bertuleit, a prominent German Nazi, became the new president

Germany.—Dr Schacht was dismissed from the presidency of the Reichsbank. Dr Herr Funk, Minister of Economics, succeeded him

Czechoslovakia.—The Slovak Diet was formally opened at Bratislava. A new Cabinet was formed.

Jan 21 **Great Britain.**—The railways demanded a "square deal".

England beat Wales at Rugby football by 3–0.

Kenya.—An Immigration Advisory Board was set up to control the flow of refugees.

Belgium.—The Cabinet was reorganized Two Flemish academies were officially opened.

Germany.—A new decree enforced extra-military training of all able-bodied men between 17 and 45.

Soviet Union.—A forbidden zone of about forty miles radius was created around Leningrad.

Lithuania.—It was decided to construct a new port at Shventias, outside the Memel Territory

Spanish Civil War.—General Franco's troops captured Arbos, 29 miles from Barcelona.

Jan. 23: **Great Britain.**—An Advisory Council was appointed to utilize professional workers in wartime.

Cricket.—England won the third Test Match against South Africa

Spanish Civil War.—In the course of raids on Barcelona, one British ship was sunk and two were damaged.

Jan 24: **Great Britain.**—An inaugural National Service rally was held at the Albert Hall.

Skating.—The Ladies European Figure Skating Championship was retained by Miss Cecilia Colledge

Germany.—A cultural agreement between Germany and Nationalist Spain was signed at Burgos.

Spanish Civil War.—The Nationalists reached the suburbs of Barcelona. The Republican Government moved to Gerona, and the exodus of refugees began.

Soviet Union.—Following changes in the personnel and composition of the Council of People's Commissars, decentralization brought the total number of Commissariats to thirty-six.

Jan. 25: **Aviation.**—A new air service was arranged from Burma to Hong Kong through Yunnan.

Canada.—The defence programme was placed on a long-term basis.

Great Britain.—Sir Stafford Cripps was expelled from the Labour Party by a vote of eighteen to one.

A Committee was appointed to consider Marriage Law Reform

Turkey.—Following the resignation of M. Telal Bayar, Dr Refik Saydam formed a new Cabinet

Boxing.—Joe Louis, the world heavyweight champion, beat John Henry Lewis in 2 min 29 sec at New York.

Italy.—Sixty thousand men of the 1901 class were called up for training on Feb. 1.

Poland.—Herr von Ribbentrop visited Warsaw for conversations with Colonel Beck.

Jan 26 **Spanish Civil War.**—Barcelona fell to the Nationalists

Canada.—The expansion of the Air Force was announced.

Rumania.—Professor Vasile Cristesur, leader of the Iron Guard, was shot at Bucharest Several Iron Guard Terrorists were also arrested.

Chile.—A severe earthquake shook Southern Chile and was particularly devastating at Chillan and Concepción. Preliminary estimates gave 20,000–30,000 dead and 50,000 injured

Jan. 27 **Great Britain.**—In the East Norfolk by-election, Mr F Medlicott (National Liberal) was returned

United States.—Mr Roosevelt's Emergency Relief Bill was passed by Congress.

Canada.—A government inquiry into Nazi propaganda was instigated

Czechoslovakia.—Arrangements whereby Britain and France put £16 millions at the disposal of the Czechoslovak government were completed.

Turkey.—The Kamutay (National Assembly) voted for its own dissolution.

Jan. 28: **Great Britain.**—Important Cabinet changes were made.

Mr. Chamberlain's speech on foreign policy and national defence was broadcast throughout the Empire

Hungary.—Conscription for all Hungarians between 12 and 60 was introduced.

Jan. 29: **Germany—Poland.**—Agreement was reached on the question of Polish Jews expelled from Germany at the end of October.

France.—New decrees effected economies on road improvements and the salaries of local bodies.

India.—Mr. Subhar Chandra Bose was re-elected President of the Indian National Congress.

Jan. 30: **Australia.**—A new loan of £8,500,000 to finance public works was issued.

United States.—The Supreme Court rejected the Tennessee Valley Appeal.

Jan. 31: **Great Britain.**—Parliament reassembled.

Germany.—Three German newspapers ceased publication.

United States.—At Columbia university, New York, the uranium atom was split into two parts, each with an energy of 100 million electron volts.

The sale of American aircraft to France, and Mr. Roosevelt's "departure from neutrality" were strongly criticized by Republican leaders.

Soviet Union.—An outline of the Third Five-Year Plan was published in Moscow by M. Molotov.

A

ABERCROMBIE, LASCELLES, English poet and critic, was born at Ashton-upon-Mersey, Cheshire, on Jan. 9, 1881, and died in London on Oct 27, 1938. A brief notice of his life and work may be found in the *Ency. Brit.*, vol. 1, p. 35 In 1935 Dr. Abercrombie was appointed Goldsmiths' Reader in English at Oxford University. His later publications included. *Twelve Idylls*, 1928; *Progress in Literature*, 1929; the British Academy Shakespeare Lecture, *Liberty of Interpreting*, 1930; *The Sale of St. Thomas*, 1931; and *Poetry—its Music and Meaning*, 1932. His *Collected Poems* were published in the Oxford Poets in 1930.

ABYSSINIA: *see* ITALIAN EAST AFRICA.

ACCIDENT AND MISCELLANEOUS INSURANCE. Those sections of insurance business which are included under the heading of accident and miscellaneous are all of fairly recent origin, having developed out of certain modern trends. Such important sections of insurance as motor, third party, burglary, and workmen's compensation have all been originated within a period of fifty years or so. For this reason these sections are still in process of expansion, and each year sees an advance in the volume of business accepted by insurance companies in practically every country of the world. As an example, the premiums written by British offices with their world-wide connexions, in each of the principal sections of accident business, are given as follows:

	1937	1936
Motor . . .	£37,318,352	£35,210,019
Employers' Liability . .	8,716,804	7,666,665
Personal Accident .	3,777,495	3,541,214
Miscellaneous . .	26,894,292	25,068,493

These figures may be taken as illustrating the general trend of the business throughout the world. The motor section maintains its place at the head of the department. The figures of British offices include business written abroad, where those offices have substantial interests. The aggregate foreign business is, however, much larger, and the turnover of premium in the United States alone reaches very high figures, especially in regard to motor insurance.

The general experience of accident business has not been particularly favourable, largely because of the increasing pressure of the claims ratio in motor business. In the United Kingdom, motor claims continue to increase both in number and in average cost. The expected effect of the House of Lords decision in Rose *v.* Ford has been fully realized, and many costly claims have been received from dependants in respect of loss of expectation of life in consequence of fatal accidents. There have been various decisions in the courts on this point, and much difficulty has been experienced by judges in determining a guiding principle for assessing damages in such cases. In spite of such difficulties, however, the 1937 accident results of British offices, as reported during 1938, showed profit margins on the aggregate figures. Thus in motor business the earned profit was 1·7 per cent, in personal accident business 5·3 per cent, and in miscellaneous business ten per cent, so that the meagre results of the motor section were compensated by good returns from the miscellaneous section. This latter includes many small branches of insurance, which, though not large in themselves, combine to make up an increasingly important section of the business. Amongst them is aviation insurance, which presumably has a great future before it, but which at present is affected by the uncertainty attaching to a business in its early years. During the year 1938 a number of air disasters occurred which certainly must have thrown serious burdens on this class of insurance The business is largely transacted by substantial groups of offices, or by the sharing of risks through pooling arrangements. This has the effect of subdividing the business amongst a number of different interests, thereby limiting the cost of claims to each individual office. This system has much in its favour in a class of insurance which possesses an inherent risk of catastrophe.

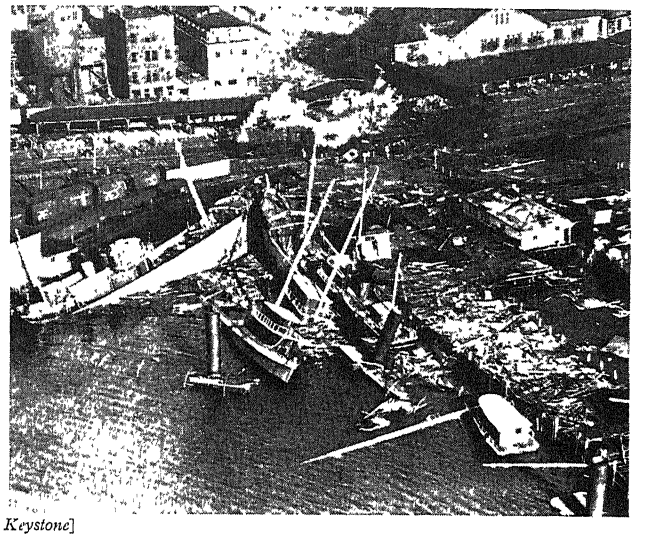
Some branches of accident insurance have been made compulsory by law. Thus in many countries third-party motor insurance must be effected before a car can be used. The number of countries imposing such a law increases every year, and the system is likely to become universal. In Great Britain compulsory insurance is also required in connexion with the use of aircraft and to a limited extent in regard to workmen's compensation. The whole subject of compulsory insurance has been recently considered by a departmental committee, who submitted a report in July 1937. The suggestions made were drawn up after an exhaustive examination of the subject, but no radical extension of the principle of compulsory insurance is recommended. In the King's speech at the opening of parliament in Nov. 1938 reference was made to an intention to introduce a Bill to amend the law relating to the carrying on of the business of insurance. At the time of writing the text of this Bill is not available, but it will presumably amend the Assurance Companies Act 1909 somewhat on the lines laid down by the Clauson committee in 1927 and embodied in the then proposed Insurance Undertakings Bill. Any new Act will no doubt apply to all classes of insurance business, but it will be of particular interest in the accident department, because it may be expected to bring within its purview all those many sections which were excluded from the Act of 1909, while at the same time there is likely to be some provision as to the range and extent of compulsory insurance.

(C. E. G.)

United States. How important casualty insurance has become may be gathered from a glance at some of the statistics covering this field. The accident and health premiums written by both stock and mutual companies for the year 1937 totalled $147,510,757. The stock companies as a whole showed a larger percentage increase than did the mutuals.

The motor-car liability insurance premiums for 1937 totalled $246 millions and accounted for approximately eighty per cent of premium income in liability insurance in 1937.

The underwriting profit on all accident and health insurance for the year 1937 was $11,364,904, or 7·8 per cent of earned premiums. A fairly substantial profit was earned



on all lines of motor-car insurance except collision, on which there was a loss of $1,114,902.

ACCIDENTS AND DISASTERS took a heavy toll during 1938 on land, at sea, and in the air. The worst aviation disaster occurred in July at Bogota, Colombia, when a stunting military aeroplane crashed into a stand, killing 50 people. At Tokyo on Aug 24, 28 died and 130 were injured after two planes collided and set fire to an iron foundry. Twenty perished in an Italian air-liner off Sardinia on July 14, and a similar number on Oct. 10 in a Belgian air-liner disaster in Germany. Nineteen were killed when an Italian air-liner, whose passengers included guests returning from King Zog's wedding in Tirana, crashed 80 miles from Rome on April 30. Eighteen were lost in a crash on Mount Dandenong, Australia, on Oct. 25, and 16 in a Czech passenger plane in Germany on Aug 15 Other major disasters included 14 deaths in an Italian air-liner crash at Varese on Aug. 18, 14 in the Jersey Airways crash at St. Helier on Nov. 4, 13 in a German air-liner near Splugen Pass in Switzerland on Oct 1, 12 in a Hungarian passenger plane which fell near Debreczen on Aug 10, and 10 (including 9 civilians) when an R A.F. plane crashed on a house near London on Sept. 4. In the Pacific, the " Samoa Clipper " was lost on Jan. 11, with 6 lives, and the " Hawaii Clipper " on July 29, with 15. A crash in Montana, U S.A , on Jan. 10, caused 10 casualties ; another on May 24 in Ohio, another 10, while in a crash in Mexico on Aug. 12, 11 were killed. Near Bathurst, Gambia, a German transport plane failed on an experimental flight on Nov. 26, and 11 perished. The Soviet airship V6 was destroyed in Northern Russia on Feb. 6, with 13 on board.

Road and railway accidents were numerous, a particularly distressing one being the death of 25 children and a driver in a collision between a school bus and a train on Dec. 1, near Salt Lake City, U.S A. The worst railway accident occurred, however, in Rumania on Dec. 24, in a collision in which 100 were killed and 300 injured. Brazil and Jamaica both suffered serious accidents, the former on Dec 19, with 90 fatalities ; the latter on July 30, with 52. Similar disasters occurred in Montana, U.S A. on June 19 with a roll of 47 dead ; near Mexico City on Dec. 21 (40 killed) , in Nova Scotia, on Dec. 6 (21 deaths) ; near Udine, Italy, on Nov. 23 (20 deaths) ; and in India, between Madura and Trichinopoly, on Aug. 21 (20 killed, 100 injured). In Britain, there was an underground railway smash in London, on March 17, when 6 were killed and 60 injured.

Disasters at sea were numerous. In January the Grimsby trawler " Leicestershire " with 15 hands, and the Fleetwood boat, " Bostonian," with 12 hands, were both lost. In September the Hull trawler " San Sebastian " was wrecked near Spitzbergen with a loss of 15 lives. On Aug. 7 the Lowestoft trawler " Alcazar " sank in the Irish Sea after a collision in which 7 were drowned, while in a collision between the German " La Plata " and the Greek ship " Akti " in the Bay of Biscay on Dec. 5, 17 went down. Twenty-eight sailors were drowned in a storm off the Anatolian coast on Sept. 22 ; 30 when a ferryboat sank near Lisbon on Dec. 19, and 8 when a ferryboat capsized at Sydney, on Feb. 4. An explosion on the Italian cruiser " Quarta " near Majorca on Aug. 18 killed 15 sailors ; fire destroyed the " Italian Prince " off Cape Finisterre on Sept 6.

The most spectacular fire broke out in Marseilles on Oct. 28, destroying part of the famous Canebière and causing 75 deaths ; but the worst casualties were in the burning of Changsa in China, when 2,000 perished. At Atlanta, Georgia, 34 died in a hotel fire on May 16 ; in Quebec on Jan. 18, 17 students and teachers were suffocated in a fire at the College of the Sacred Heart , and at Coimbra, Portugal, 14 boys perished on July 6, in an exhibition of fire-fighting. Brush and forest fires were responsible for much damage in Vancouver, B.C., Ontario, Minnesota, and Southern California. Two major coal-mine explosions occurred, the Markham Colliery disaster in England on May 10 with 79 fatalities, and one in Virginia, U.S.A., on April 23 with 54. Explosions in munitions factories occurred at Ardeer, Scotland (6 deaths), on Jan. 27, at Segni, near Rome (15 dead, 200 injured), on Jan. 29, at Cordelio, Greece, on Nov. 18, virtually demolishing the town ; and at Hospitalet, Spain, on Nov. 18, killing about 400 persons.

Keystone]
THE WATERFRONT AT NEW LONDON, CONN., AFTER IT HAD BEEN STRUCK BY A HURRICANE, SEPT. 28, 1938

Tornadoes, hurricanes, and floods wrought much havoc. They were particularly devastating in Turkey, in various parts of the United States, where, in the north-eastern states 682 persons were killed in the September hurricanes, and in China (*see* IRRIGATION AND FLOOD CONTROL), while Japan and the Philippine Islands suffered from violent typhoons. Earthquakes were severe in Central Anatolia, Turkey, in April, when more than 300 lives were lost, and again in December. On June 11 the first earthquake tremor for 50 years was felt in north-western Europe. A series of mountain avalanches overwhelmed more than 200 persons at St Lucia, B.W.I , on Nov 22, and on Dec 24 an avalanche in Japan caused heavy casualties.

Among well-known people accidentally killed during the year were : Lord and Lady Plunket ; the Count of Covadonga, King Alphonso's eldest son ; Col. Valeri Chkaloff, Soviet's famous long-distance aviator , Lt.-Col. Ramon Franco, brother of General Franco ; Mr. C. F. M. Swynnerton and Dr. B. D. Burrit, government scientists in Tanganyika ; James Williams (Nilaud), world's champion parachutist. (E. D. E.)

ADEN. Aerial operations against raiding tribes in the Aden protectorate were carried out by the R.A.F. Aden command on several occasions during 1938, the raiders giving guarantees of future good behaviour and stolen property being returned. A dispute with the Imam of Yemen, which had threatened communications between the two countries, was successfully settled in September. Much thought was given to preparations for Aden's centenary as a British possession, which fell on Jan. 19, 1939. It was decided to commemorate the date by the establishment of an infant welfare centre and the introduction of a

permanent system of poor relief. Towards the inauguration of these schemes £6,000 was subscribed in Aden itself.

Area and Population :
Aden Colony, including Perim Is., etc , Area 80 sq miles, population (1931) 46,638
Aden Protectorate, including Socotra, Area 112,200 sq. miles; population (estimated) 600,000.
Governor : Lt -Col Sir Bernard Rawdon Reilly, K C.M.G
Language. Arabic.
Religion. Mohammedan.
Production :
Tobacco (in the Protectorate) . Annual Value, approx Rs. 500,000
Salt . production (1936) 355,115 tons; export (1936–37) 322,837 tons.
Overseas Trade (1936–37) :

Imports	£5,330,016
Exports	£3,115,964

Finance and Banking :

Revenue (1938–39) .	Rs. 18,90,000
Expenditure (1938–39) .	Rs 17,43,000

Currency. Rupee (Rs 1 = 1*s* 6*d*.)
Motor Vehicles Licensed (Dec. 31, 1936): 521 cars and taxis, 122 commercial vehicles.

ADENOIDS : *see* EAR, NOSE, AND THROAT, DISEASES OF

ADULT EDUCATION. The "Challenge to Democracy" during 1938 stimulated and increased the work of Adult Education in many countries, notably in the British Dominions, the United States, and Scandinavia The efforts have varied greatly in method and content, in accordance with the conditions and environment of the diversified interests of the peoples concerned.

In England and Wales the universities are reinforced by financial grants from the Board of Education and many local education authorities. Requests for classes are usually made by voluntary bodies which organize them, notably by the Workers' Educational Association, which in co-operation with universities inspired and created the "Three-year University Tutorial Class", of which there were 771 in 1937. These classes must, in accordance with the regulations, make "the standard of university work in honours a possible aim. The course must be planned to reach that standard within the limits of the subject".

On April 27, 1938, the Board of Education issued a revised draft of "Adult Education Regulations" for such universities and approved bodies, other than local education authorities, which desire grant-aid for their classes. All universities and university colleges in England and Wales were at work in 1938 under these regulations. The university authorities are 21 in number, and there are eight other recognized bodies of a non-university character. The universities of Scotland and Northern Ireland come under other administration.

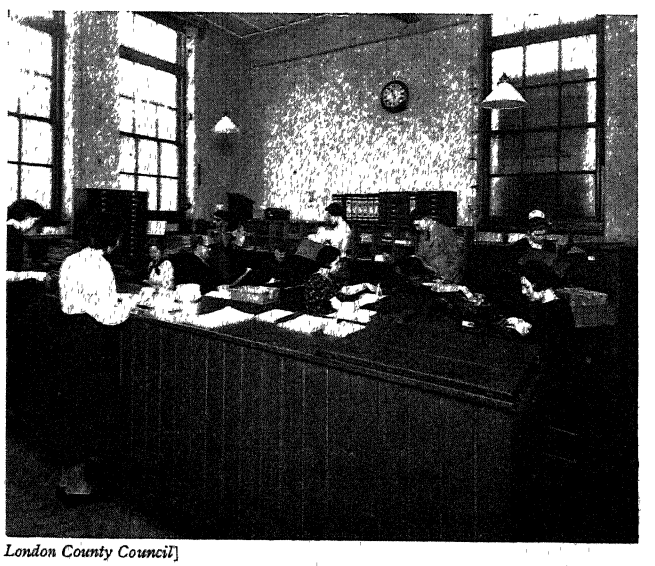
The provision for Adult Education in evening institutes and classes maintained by local education authorities is made under "Regulations for Further Education". During the year ending July 31, 1937, there were 3,011 recognized groups or classes; of these, 1,523 were university extra-mural and 1,169 were under the auspices of the Workers' Educational Association. They were almost entirely "humanistic" in content.

An important agreement between university extra-mural authorities was reached in 1938, providing for joint action in arranging for lecture courses. As a result, distribution of such courses should be more uniform and their number increased. In 1937, 404 such courses earned Board of Education grants.

The latest reports from the Dominions reveal that there were 124 tutorial classes in Australia, seventy in New Zealand, 54 in Canada, and four in South Africa. They are not all, however, three-year classes, and the obligations are not so rigorous as in England and Wales In addition there were numerous other class and lecture courses. The subjects studied are similar to those in England : literature, drama, and economics being prominent among them.

Much activity has been noticeable in India. For example, an advisory committee appointed in Jan. 1938 by the government of Bombay, published a report which not only deals with methods of organization, but makes important recommendations concerning many aspects of Adult Education.

In the United States there is taking place what may roughly be termed a mass movement towards Adult Education. Almost every known form may be discovered in one State or another Universities and colleges vary greatly in their extra-mural activities. The forum method —a series of lectures on subjects of topical interest followed by organized and sometimes broadcast discussion—has been adopted increasingly.



Educational trusts, particularly the Carnegie Corporation of New York, have assisted, not only in the States, but in the British Dominions, particularly through book provision and travelling bursaries. Canada has benefited greatly. Grants have been made by the Carnegie Corporation to the Canadian Association, and to such forward movements as the provision of a rural library system in Prince Edward Island, and the notable extra-mural work among fishermen and agriculturists of Antigonish (Nova Scotia) University.

A special department of Adult Education has been created in Newfoundland. The first summer school for adult women students was held in 1938.

Music and drama schools are on the increase in England as elsewhere. There has been no addition to the nine residential colleges for adult students in Great Britain, of which Newbattle, near Edinburgh (1937), is the most recently created. Non-residential educational settlements in Great Britain now number 29; that at Pontypridd was opened in 1938.

The Workers' Educational Associations in Denmark and Sweden, the study circle movement in Sweden, and the Seafarers' Education Service of Norway, have all developed during the year. At Pontigney Abbey in France there have been conferences and schools specializing in Adult Education.

Larger numbers of essential books have been accessible to adult students generally. The National Central Library issued 12,648 such books to English classes, and the

London County Council]
OFFICE TRAINING IN A COMMERCIAL INSTITUTE

National Library of Wales 10,889 to Welsh classes. The Public Library authorities in Great Britain and the Dominions have also increased their special provision

Much has not been touched upon, even in England itself: for instance, the work of the College of the Sea, of sectional movements such as the Co-operative, with its College and classes; the Church Tutorial Class Association, and the National Council of Labour Colleges

Among the by-products of Adult Education are the increased vitality of the individual student, and a wiser approach to local, national, and international problems.

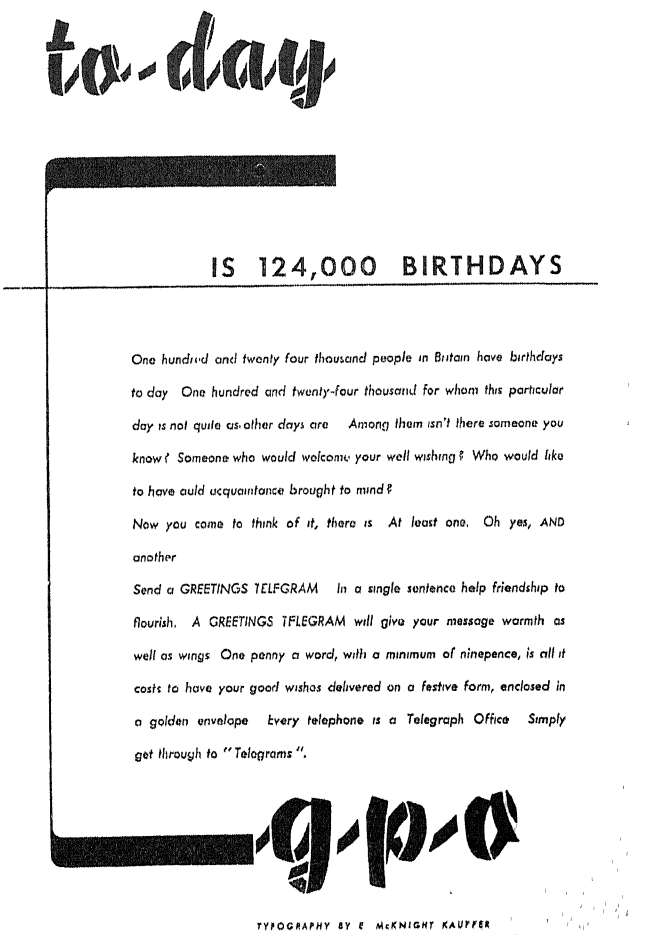
ADVERTISING. During 1938 newspaper advertising expenditure in Great Britain decreased by about 2% as compared with 1937. The fall was about 3·2% in London morning newspapers, 10·9% in London evening newspapers, 5% in national Sunday papers, and 2·7% in provincial daily newspapers. An increase of 14% was reported for London suburban and provincial weekly papers and an increase of 5·5% for weekly and monthly magazines.



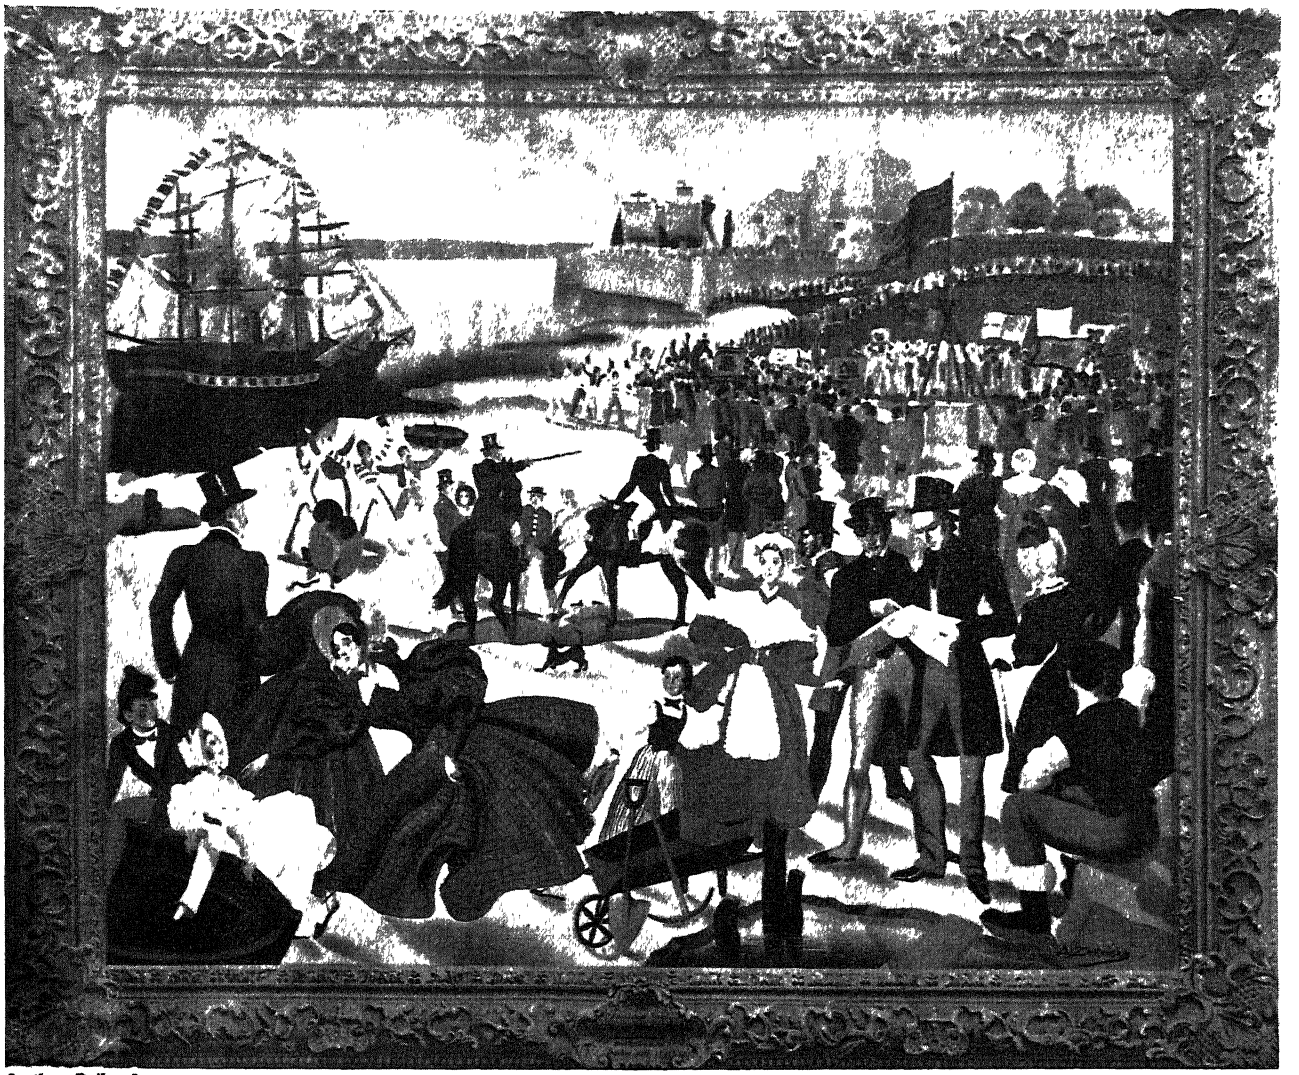
Newspapers. One outstanding feature of newspaper advertising was its increasing use by the British Government, particularly to attract recruits for the armed forces and to secure the services of the civilian population for A.R P.

A notable newspaper advertising campaign was launched by the British Medical Association during 1938. It was undertaken with a view to giving guidance on some important matters relating to public health, and although there were difficulties with certain newspapers at the start as to the precise wording of certain statements, the campaign was significant as being one of the first to be sponsored by a professional body—and that body one of which the individual members have always set their faces sternly against advertisement.

Co-operative advertising by industries continued to function on a large scale, notable among them being the milk industry and the brewing industry. Gas and electricity, the railways, and the London Passenger Transport Board were also responsible for large advertising expenditures.

Copy and Layout. The influence of American technique still remained apparent in the wide use of strip-cartoon advertising—a series of small pictures with appropriate wording designed to tell the advertising story graphically and vividly. Humour continued to be a feature of much British advertising. In Britain national campaigns are designed very largely for newspapers (as compared with magazines in America) because it is calculated that eight London morning newspapers now reach between them approximately 75 % of all families.

Posters. The chief development in poster advertising was the growing recognition amongst industrial firms that posters displayed in rural surroundings are not only æsthetically undesirable but are also bad business on the part of the advertiser. In large towns, on the other hand, posters can well be held to add to the amenities of life, especially when they are carefully kept and displayed on the type of well-designed and neatly panelled hoarding which became increasingly noticeable during 1938. In the building of new railway stations the design included specially planned spaces for the display of posters in an orderly and attractive way.



TYPOGRAPHICAL ADVERTISEMENT FOR THE G.P O., DESIGNED BY E MCKNIGHT KAUFFER, FOR MATHER & CROWTHER LTD.

Radio. Radio advertising is not permitted in Great Britain, but more British advertisers used the facilities offered by Continental broadcasting stations There was a marked tendency to produce more elaborate programmes, with higher entertainment-value and less concentration on the actual advertising message Many of the leading stage, film, and radio stars were engaged, and the audiences consequently increased, especially on Sundays. Negotiations took place on the withdrawal of these commercial radio broadcasts from the Continent, but no definite results were reported.

Films. Advertising films reflected the improved technique of film production as a whole in Great Britain. There is still some feeling that cinema audiences should not be expected to favour their display, but many advertising films of the year were so well produced as to be received with pleasure and recognized as providing an invaluable means of illustrating a complicated process, such as that of the manufacture of a motor-car.

Aeroplanes. In suitable weather, advertising by means of streamers attached to aeroplanes is frequently used. One of advertising's lighter moments occurred during a match at Lord's cricket ground. Bradman was batting for the Australians and was hit by a fast ball on the foot. At that very moment an aeroplane flew over the ground, recommending the use of a certain preparation " for tired feet ". Seldom can the word and the moment have synchronized so happily.

Research. The year showed that ever added attention is being paid to research, both as to the possible markets and

Southern Railway]

SOUTHERN RAILWAY POSTER FOR THE SOUTHAMPTON DOCKS CENTENARY, FROM THE PAINTING BY ANNA ZINKEISEN, SHOWING THE FOUNDATION-STONE LAYING OF THE FIRST DOCK, OCT. 12, 1838

the purchasing habits of the population and as to the quality and quantity of newspaper and magazine circulations. There was also a growing tendency on the part of publications to supply their advertisers with reliable facts and figures on the income, living conditions, and habits of their readers.

Legislation. There were no notable developments in 1938 in legislation as it might affect advertising, with the exception of the introduction of a bill designed to control more effectively the advertising and sale of patent medicines.

Advertising in America. In the United States, network radio advertising increased by about 1 % over 1937. Newspaper linage decreased by 14%, magazine by 22%, agricultural journal by 14%, and outdoor advertising by 1%. The net total result shows a decrease during the year of about 14%.

Newspapers and Magazines. Rotogravure and coloured advertising increased in 1938, appearing on news pages as well as in feature sections. Advertising was used more extensively to convey information about companies and industries to stockholders, employees, and the public generally. A leading commercial bank published the series of advertisements which was considered to contribute most towards the advancement of advertising as a social force. The purpose of this campaign was to refute anti-business propaganda and to remind newspaper readers of basic economic truths through simple, self-explanatory facts and figures.

Copy and Layout. Legislation encouraged factual rather than emotional appeal. Prices and values received greater emphasis. The tendency was to combine information with entertainment. Industrial copy became less blatant, more temperate and rational. Photographic reproduction was more authentic and a greater variety of subjects was considered suitable for photographic treatment. Cartoons remained popular and humour was used extensively, even in the advertising of products not intrinsically humorous. Many advertisements were designed to resemble adjacent items of news.

Posters. The Traffic Audit Bureau compiled annual statistics for about two-thirds of the standard outdoor poster hoardings in the United States, showing the number of persons passing each site. Greater variations in colour were seen on painted signs, and animated displays were used to create the illusion of movement.

Radio. The joint committee on radio research studied methods of determining the areas in which the advertising programmes of individual broadcasting stations were best heard. Advertising appeals were more closely associated with the entertainment features of the programme, and transcriptions were more generally used. Television is technically feasible for the purposes of advertising, but it is not likely to become an immediate practical proposition.

Research. Specialized research organizations, publications, and advertisers increased their activities in an effort to assure maximum returns for expenditure. Research studies yielded more reliable results, reflecting improved technique and more experienced personnel. Advance testing of advertisements before they are published is making possible substantial savings for many advertisers, and selected audiences were invited to register opinions on proposed radio programmes.

Legislation. The Wheeler-Lea Act, 1938, prohibits any advertising or merchandising practice which is unfair to a competitor, a consumer, or the general public. It makes it unnecessary to prove injury to a competitor; it is enough to show that the advertisement is misleading in a material respect. Both civil and criminal penalties are provided. The Food, Drug and Cosmetics Act supplements the Wheeler-Lea Act by prohibiting misrepresentation of foods, drugs, or cosmetics and the use of harmful ingredients.

The United States Supreme Court upheld a State law taxing income derived from the sale of advertising space. In another decision, the Court ruled that a local statute regarding the distribution of advertising material was unconstitutional because it violated the freedom of the press. The Department of Justice, late in 1938, announced that its investigation of monopoly practice would determine whether advertising creates a monopoly by taking unfair advantage of competitors.

Co-operative Advertising increased in volume. The motion picture industry undertook one of the outstanding campaigns, with advertising appearing in practically every daily newspaper and a contest offering $250,000 in cash prizes. States, counties, and communities advertised to promote tourist trade and attract new industries.

Competitions and Premiums. Competitions remained popular among national advertisers, with prizes distributed both to consumers and retailers. Prizes included cash, life insurance annuities, cars, furs, refrigerators, radio sets, silverware, and blankets. The National Retail Dry Goods Association urged manufacturers to restrict prizes to their own products, on the ground that retail stores are reluctant to push the sale of articles freely given as prizes. The increasing number of prizes offered was partly the result of an effort to offset declining sales volume and most advertisers required competitors to submit coupons or other evidence that merchandise had been purchased, together with a small cash payment. AEGEAN ISLANDS, ITALIAN. Juridical changes were carried out by governor's decree in the Aegean Islands during November. The jurisdiction of special courts for Mohammedans, Jews, and Christians of the Orthodox Church was restricted to questions of cult. All other matters have by the new decree to be submitted to ordinary civil law courts, all notarial services must, according to the laws prevailing in continental Italy, be derived from the State and not from the religious communities. A further order created municipal registration offices to which all the inhabitants must report themselves as in Italy. These measures bring legislation in the Aegean possessions into line with Italy proper; reduce the functions of the religious communities; and strengthen the administrative hand of the government over this strategic area of the Eastern Mediterranean. (I. S. Mu)

Area and Population:
Area 960 sq. miles.
Population (est. Dec 31, 1936) 141,000.
Chief Towns: Rhodes (27,466), Calino (15,247).
Governor. Count de Vecchi.
Production:
Olive oil (1937) . . . . 1,100 metric tons
Wine (1936) . . . . . 25,000 hectolitres
Overseas Trade 1937:
Imports . . . . . 122,374,000 lire
Exports . . . . . 19,705,000 ,,
Roads: motor (Dec. 31, 1937), 372 miles (279 miles in Rhodes).
Education 1937–38:
Elementary: schools, 105; scholars, 12,569.
Secondary: ,, 8; ,, 865.

AERONAUTICS. New methods of calculation and experiment characterized aeronautics during 1938. In the difficult theory of the science, no sooner is one obstacle surmounted than further development of flying makes others appear. Direct tests on scale models in wind tunnels, on the other hand, require sweeping correction before application to aircraft.

A large tunnel (its 145-m.p.h. working stream has an elliptical section measuring fourteen ft. by ten ft. and the aerodynamic forces may exceed one ton weight) has been erected by The Fairey Aviation Co. (*see* illustration), whilst a rather similar installation is also under construction at the National Physical Laboratory (N.P.L.). These tunnels accommodate sufficiently large models to include details which are usually omitted from tests. As an example of the importance of such refinement, the centre of pressure of a model twin-engined monoplane was found to be displaced by some three per cent of the total length when model airscrews were working in position. However, the change to much larger Reynolds numbers in the turbulence-free atmosphere still remains to be negotiated.

Fairey Aviation Company]

A LARGE WIND TUNNEL. IN THE BACKGROUND IS THE CONTRACTING FLAIR SPEEDING AIR INTO THE WORKING SECTION, ABOVE WHICH IS THE FRAMEWORK OF THE AERODYNAMIC BALANCE, WHOSE WEIGHING BEAMS ARE IN AN UPPER ROOM. PART OF THE RETURN DUCT, 18 FT. MEAN DIAMETER, IS SEEN TO THE RIGHT

An outstanding problem in this connexion has been solved approximately at the Royal Aircraft Establishment (R.A.E), *viz.* the "form drag" of wings. Experiments in the compressed-air tunnel at the N.P.L. provided a valuable check on knowledge of flat-plate skin friction up to the largest Reynolds numbers of flight, but also verified that, on calculating from this knowledge the skin friction of wings and duly allowing for the resistance necessarily associated with lift, an important form drag remained. Aeroplane designers have long recognized the effect; they are now able to make more reliable numerical estimates Extension of the theory to the case of streamline bodies is possible, partly by virtue of recent work in Japan on the boundary layer of a sphere.

Both form drag and skin friction depend upon the positions round the contour at which the laminar flow in the forward part of the thin boundary layer of viscous effects becomes turbulent These "transition points", the subject of experiments in flight at Cambridge and the R.A.E., may occur at more than one-third of the chord (*i e.* width) of a wing from its nose, but they are moved forward disadvantageously by roughness of surface or propeller disturbances. Can transition points on aircraft in flight be predicted from tests on models in wind tunnels? The answer may be obtained at the N.P.L. from a new seven-ft. tunnel whose specially long settling chamber and working section should render its stream exceptionally steady. Inserting graded grids will make possible the study at fair scale of definite degrees of small turbulence.

A new method of calculating *a priori* the skin friction and lift for the lower Reynolds numbers at which breakaway occurs before turbulence sets in has been evolved at Queen Mary College, London. This depends essentially upon introducing the wake analytically. Assuming any reasonable wake-thickness is shown to remove at once the discordance formerly existing between theory and experiment, stalling can be forecast with some accuracy. Simple formulæ result for calculating the positions of breakaway approximately. The theory is being applied to the new families of conformally transformed wing shapes, which have been somewhat simplified.

Work in Germany has included great improvement of the smoke tunnel, which, in conjunction with the slow-motion camera, now provides ready insight into flow phenomena beyond our means of calculation. General analysis of airscrews has indicated peak efficiency at aircraft speeds of about 350 m.p.h. Serious losses are expected at 400–450 m p.h., due essentially to spin of the slipstream, which it is proposed to obviate by using tandem airscrews rotating in opposite directions.

Increasingly high speeds, as also high-altitude flying near the stratosphere, where sound travels twelve per cent more slowly and shock waves are proportionately more liable to form, have emphasized the need for detailed study of compressible flow. Very fast wind tunnels are being installed at the N.P.L. and R.A.E., the former measuring twenty in. by eight in. in section and being fed from a 5,000-cu. ft. reservoir pumped up to some 25 atmospheres pressure, to investigate effects of shape (the circular cylinder generates shock waves at only forty per cent of the speed of sound, a thin aerofoil at over eighty per cent). An interesting addition to the technique required has been developed from the warming effect of skin friction. This heating is unequally distributed round an aerofoil, but use of non-conducting materials enables it to be determined at any point on the contour as a continuous function of the speed, under normal conditions. If a shock wave forms at that point the local heating suddenly becomes more intense. The phenomenon may provide liaison between model and full-scale research, for thermocouples may presumably be embedded for observation in parts of aircraft suspected of requiring re-shaping from this viewpoint. Two papers on the theoretical side, from the Langley Memorial Aeronautical Laboratory, U.S.A., include calculations by Poggi's method of the effects of compressibility on the lift and moment of two Joukowski sections.

High speeds breed fear of flutter, and some direct test is desirable to determine whether it can arise in given circumstances or not. Some experiments on this dangerous phenomenon have proceeded in a novel way, variation of the permeability of nickel through change of stress being utilized to obtain, by the cathode-ray method, photographic records of the forces on a rapidly oscillating aerofoil.

Details are lacking of further experiments in the interesting U.S.A. tunnel whose axis can be so inclined to the horizon as to permit a properly weighted model aeroplane to fly (free from mechanical support) against a stream directed slightly upwards. The control surfaces of the model can be operated electrically from outside the tunnel, providing a direct demonstration of stability and controllability. The same end is being approached in Great Britain by experiments of a different kind, the stream remaining horizontal while the weight of the model is supported by a vertical rod pivoting in a cup below the tunnel. Difficulties already appear to be overcome in the case of lateral stability. (*See* also AVIATION, CIVIL; AIRPORTS; AIR RACES AND RECORDS). (N. A. V. P.)

AFGHANISTAN. Undisturbed even by the unrest in Waziristan, Afghanistan has enjoyed another year of unwonted peace, and is making rapid strides towards western civilization. Roads are being laid out for motor traffic; industries, based originally on military requirements, are being developed; and education is spreading. There are three colleges in Kabul, and schools are being set up everywhere. Mahommed Zahir Shah continues to rule, with a Council of Ministers, a nominated Senate, and an elected Assembly. (ME.)

Area and Population:
Area 250,000 sq. miles.
Population (est. 1937) 7,000,000.
Chief Towns: Kabul (80,000), Kandahar (60,000), Herat (30,000).

Ruler: Mahommed Zahir Shah.

Languages. Persian, Pushtu.

Religion. Mohammedan.

Production: Wheat, rice, millet, maize, sheep.
Wool (1936), 6,800 metric tons.

Overseas Trade 1937–38:

Imports from India	. .	Rs. (Indian) 60,85,070
Exports to India	. .	Rs. (Indian) 3,70,61,247

Roads, Trade routes: Kabul to Peshawar (India) 210 miles.

Finance:
Revenue and Expenditure *c.* Rs. (Afghani) 150,000,000
Currency: Rs. 3·65 (Afghani) = Rs. 1 (India) = 5*d.* approx.

Education. Confined chiefly to Kabul.

Army. Compulsory service; peace strength 60,000.

AGRICULTURE. British farming suffered a considerable setback in 1938 as the collapse of world commodity prices made itself felt on the British market. Fortunately several home-produced foodstuffs enjoy guaranteed prices; fortunately, also, the harvest of 1938 proved particularly good.

The acreage under each of the principal cereals increased substantially, as a result probably of the relatively favourable prices ruling in 1937. Despite a spring drought of exceptional duration and a sunless July which retarded ripening, all the corn crops yielded better than last year and better than the ten-year average The wheat yield in England was the highest ever recorded. Comparative acreages and yields of the principal British cereal crops in recent years appear in the following table:

	Wheat		Barley		Oats	
	Acreage	Yield per acre	Acreage	Yield per acre	Acreage	Yield per acre
	000 acres	bushels	000 acres	bushels	000 acres	bushels
1927–29 .	1,512	33·0	1,228	35·3	2,678	44·0
1934–36 .	1,843	33·2	905	34 6	2,230	44·0
1937 .	1,831	29·6	905	31·5	2,042	43·2
1938 .	1,923	38·3	986	40·6	2,097	47·0

The acreage under root crops recovered most of the ground lost in 1937. Sugar beet increased from 314,000 to 336,000 acres, potatoes from 590,000 to 610,000 acres, mangolds from 211,000 to 218,000 acres, only turnips and swedes showed a decline—from 762,000 to 745,000 acres. The output of sugar beets was disappointing and the sugar content low. Turnips were the one root crop to give a good yield. Hay crops were bad. Owing to the prolonged drought, there was in some districts no first cut at all. Out of just under 6 million acres of hay (meadow and clover) in Great Britain, over ¾ million acres were not cut. Conditions improved in the autumn and pastures provided abundant feed.

The numbers both of beef and dairy cattle declined slightly in 1938 as compared with 1937, but this was more than compensated for by an increase in the number of calves. Milk production, in spite of the drought, was well maintained, exceeding the 1937 output by about 9% and perhaps even the record output of 1936 (final figures not available at time of writing). Just over two-thirds of the total production was consumed as liquid milk.

The sheep population reached a post-war maximum in 1932, then fell by over two millions, and is now on the upgrade again, as is shown by the table of British livestock statistics given below:

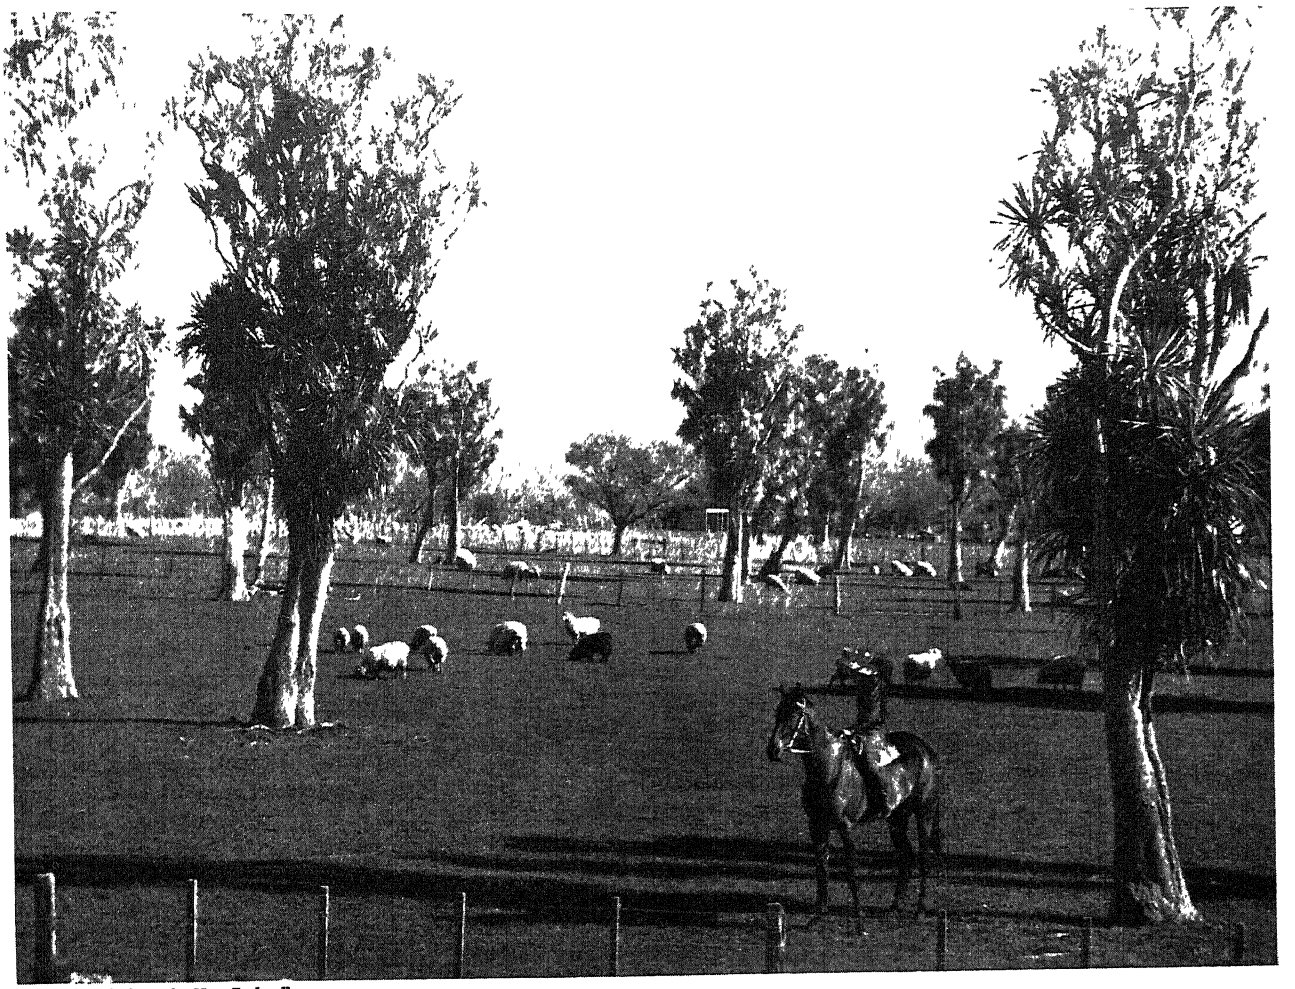
Year	Cattle	Sheep	Pigs	Poultry
	Thousands	Thousands	Thousands	Thousands
1927–29 .	7,306	24,082	2,854	50,301
1934–36 .	7,895	24,210	3,880	71,301
1937 . .	7,909	24,712	3,882	63,703
1938 . .	7,971	25,537	3,606	63,675

There has been an increasing tendency in recent years for the animals to be slaughtered earlier—as lamb rather than as mutton. There has also been a shift from arable feeding to grass feeding of sheep in order to economize labour. The pig population which increased rapidly as a result of restriction of bacon imports, still exhibits the phenomenon of a four-year cycle. In England and Wales the year 1938 formed the second year of a downward phase, and the output of pig meat declined further On the other hand the decline in the poultry population, which has been continuous since 1934, has almost ceased, and it is not impossible that as a result of the fall in feeding-stuffs' prices, poultry numbers may increase in 1939.

Market gardening also has expanded enormously since the War, the acreage under the principal vegetables increasing by over 70%. (*See* FRUIT PRODUCTION; MARKET GARDENING.)

Prices. The upward trend of agricultural prices received a check towards the end of 1937 and the general level during 1938 was some 5% lower than in the previous year, and would have been lower still but for the subsidies The following table shows open-market prices (without subsidy) for cereals:

Year	Wheat		Barley		Oats		Potatoes 1st quality Majestics	
	per cwt.		per cwt.		per cwt.		per ton	
	s.	d.	s	d.	s.	d.	s.	d.
Dec. 1936 .	8	8	9	6	7	1	139	0*
Dec. 1937 .	8	9	10	6	8	8	131	6*
Dec. 1938 .	4	3	6	4	6	0	82	6



* Average for whole year.

During the crop year 1937–38 farmers received on average just under 9*s.* 11½*d.* per cwt. for their wheat, of which 1*s.* 7*d.* was subsidy; though by December the subsidy had to bridge the gap between 4*s.* 3*d.* and 9*s.* 11½*d.*, *i.e.* it had risen to 5*s.* 8½*d.* per cwt. The oats and barley subsidies are paid on an acreage basis; however the amount received in 1938 would come to some 6*s.* 9*d.* per cwt. harvested, according to the yield on any particular farm. If reckoned on the quantity *sold*, and, for instance, farmers sold half their crop, the subsidy would represent 1*s.* to 1*s.* 6*d.* per cwt. As regards sugar beet the contract price for the 1938–39 season was advanced from 43*s.* per ton (46*s.* 3*d.* at some factories) to 44*s.* 6*d.* (48*s.* 3*d.*).

In cattle markets demand was weak both for stores and for fat stock. Sheep and pigs also sold badly, as the table of stock prices below indicates:

Year	Fat Cattle 1st quality Shorthorns		Fat Sheep 1st quality Downs	Fat Pigs 1st quality Porkers	
	Per cwt. (liveweight)		Per lb. (deadweight)	Per 20 lb. (deadweight)	
	s.	d.	d.	s.	d.
Dec. 1936 .	36	8	11¾	15	4
Dec. 1937 .	44	4	11¾	16	2
Dec. 1938 .	39	10	9½	15	5

In addition to the above price for fat cattle, producers as last year received 2*s.* 6*d.* to 7*s.* 6*d.* per cwt. subsidy according to quality and to whether the animal was bred at home or in Eire. For milk the average pool price to farmers in England and Wales was about 8% higher than in 1937, partly owing to an increased price for liquid milk which the Milk Marketing Board negotiated with the distributors in the summer months. The contract prices fixed for 1938–39 closely resemble those of 1937–38.

High Commissioner for New Zealand]

ON A SHEEP STATION, GISBORNE, NEW ZEALAND

There is no index in Britain of the things which farmers buy, but the most important items for the ordinary farmer are rent, wages, feeding-stuffs, and fertilizers. About the general level of rents little is known except that it changes slowly. Agricultural wages again rose during 1938, the average per week for adult male workers being 34*s.* 6½*d.* in June. The general index for feeding-stuffs stood at 100 in Sept. 1938 compared with 114 in Sept. 1937. By the end of the year weatings had fallen to £6 12*s.* per ton (£8 15*s.* in Dec. 1937), barley meal from £9 to £7 7*s.* per ton, linseed cake (English 12%) from £10 2*s.* to £9 7*s.*, while maize meal and cotton-seed cake remained almost unchanged. The prices of the principal fertilizers varied little during the year.

Imports. Britain depends for three-fifths of her food supply on imports from abroad. During 1938 food imports totalled £408 millions as against £413 millions in 1937. Imports of grain and flour declined by £13 millions, due mainly to the immense fall in cereal prices but partly to smaller shipments of maize. Meat imports rose by £4 millions owing to an increase in the world prices of beef, bacon, and pork. Dairy produce imports were up by £9 millions, mainly reflecting an increase in supplies of butter and cheese. On the whole, between 1931 and the end of 1937 (later figures not available) total food imports declined in volume by 12%; supplies from Empire sources were 21% higher in 1937, while foreign supplies had been reduced by 32%. Several of the chief foodstuffs imported are, of course, subject to voluntary or compulsory restriction agreements.

Agricultural Development. One of the striking events of 1938 has been the launching by the Ministry of Agriculture in conjunction with other bodies of a comprehensive programme for improving the quality and health of British livestock. Of recent years there has unfortunately been no increase in the numbers of "premium" bulls and boars, *i.e.* service animals qualifying for subsidy by reaching a certain standard.

Number of premium-service animals licensed each year

	Premium Bulls	Premium Boars
1914–15	497	115
1924–25	1,069	655
1934–35	1,476	1,032
1935–36	1,469	1,029
1936–37	1,447	1,013
1937–38	1,547	1,014

Allowing the average length of service life, this total of premium animals represents less than 10% of the service bulls and boars in use. (For measures now being taken to improve the position, *see* CATTLE AND SHEEP; also PIGS AND BACON.) To improve milk production the Ministry of Agriculture is progressing rapidly with its scheme for establishing certain areas in which all cattle are free from tuberculosis; for instance, one such area will be almost

the whole of Carmarthenshire and Pembrokeshire. These areas are intended as breeding reservoirs from which healthy stock can be distributed all over the country. In the autumn, Parliament was presented with the long-awaited Milk Bill which proposed to set up a permanent milk commission and to initiate experiments in the reform of distribution. The Bill encountered opposition and is being reconsidered Another event was the reconstitution of the Pigs Marketing Scheme. (*See* MARKETING BOARDS)

Advance is also being made in improving the housing conditions of farm labourers. The Acts of 1926 and 1930 are now supplemented by an Act of 1938 which provides a subsidy of £10 a year per house for forty years, increased in certain special cases to £12 a year, for cottages erected for farm workers. It is hoped that this will enable local authorities to provide new and more hygienic accommodation at rents which agricultural workers can afford. During the year there was a further decline in the numbers of agricultural workers, the total for Great Britain being 693,840 as against 742,455 in 1937 Part of the fall may be accounted for by the fact that in 1938 June 4 occurred on Whit Saturday when the yearly and half-yearly hirings usual in parts of England and Wales normally end.

Despite the rather less favourable conditions of 1938 farmers continue to make use of the Land Fertility Scheme. In the first annual report it is stated that more than four times as much lime and more than 70% more basic slag has been applied to the land under the scheme than in preceding years. Up to Dec. 1938 over 281,000 applications had been received in the United Kingdom, covering 2,023,000 tons of lime and 541,000 tons of basic slag. The subsidy reduces the cost of lime to the farmer by 50% and of basic slag by 25%.

Land Settlement. The Land Settlement Association was brought into being early in 1935 with the object of setting up as self-supporting smallholders unemployed men with an industrial background. To-day the Association owns 25 estates comprising a total area of 11,000 acres to which, on Nov. 30, 1938, 757 men had been transferred making, with families, a total of 3,643 persons. Of the men 328 have already become self-supporting tenants and 434 are under training.

Each group of smallholdings has attached to it an Estate Service Depot, which is run on a non-profit-making basis, where tractors and other machinery and implements are kept for the use of settlers and where there is centralized any operation which best lends itself to large-scale organization. The Association is already one of the largest producers in its particular line in the British Isles. Its total sales of produce for 1937 was £228,000 and it is confidently estimated that the figures for 1938 will show an increase of some £100,000.

The cost of setting up each settler is approximately £1,800, of which £1,000 is spent on permanent assets such as land and house, £500 consists of working capital for the settler and Estate Service Depot, which is mainly recoverable, and £310 is spent on training. The average age of settlers is 39 and the average period of unemployment prior to transfer is five years.

Australia. Agricultural conditions were less favourable in 1938 than in 1937. After the economic depression Australia had ridden up to prosperity again on the back of the sheep; but in 1937–38 wool prices averaged 12½*d.* per lb. compared with 16½*d.* per lb. in the previous season, and this involved a decline in wool exports from £51 millions to £38 millions By October the price was down to 10*d.* though thereafter it recovered. The 1937 clip reached a record of 1,015 million lb., whereas the clip which finished at the end of 1938 amounted to only 950 million lb., largely as a result of the drought.

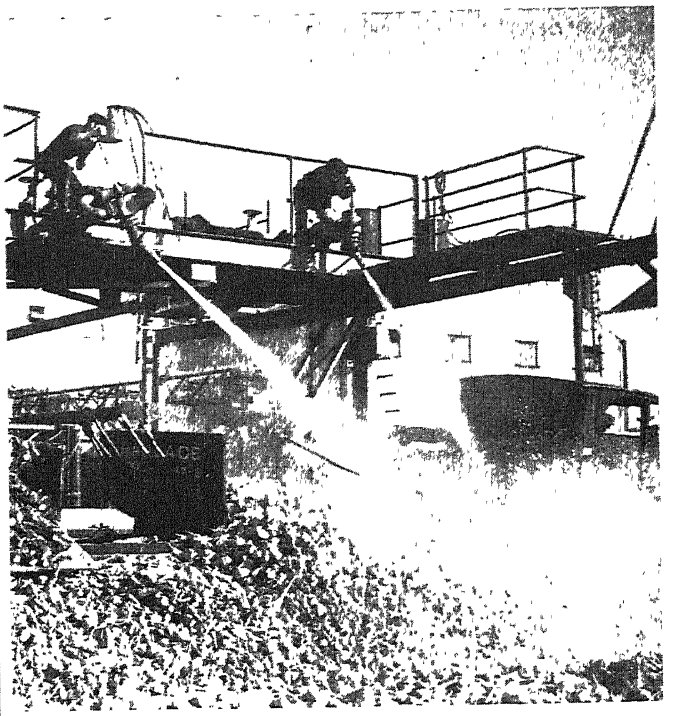
The drought has been particularly severe in New South Wales and in parts of Victoria. It affected the 1937–38 wheat crop which totalled 188 million bushels, and still more the 1938–39 crop which is expected to yield only 149 million bushels This together with the collapse of wheat prices has created an urgent problem, firstly to stabilize prices and secondly to relieve the distress of farm families in the drought-stricken areas. Accordingly an Act has been passed fixing the domestic price of wheat at 5*s.* 2*d.* per bushel f.o.r. Williamstown. The difference between this and the world price of wheat is to be met out of a tax on flour, the price of which is raised to £12 10*s.* per ton. Thus the Australian consumer is to help the distressed farmers The funds so raised are to be distributed to growers through the guaranteed price, except for £500,000 which is distributed among the states to be spent directly on transferring farmers out of marginal areas or on helping them to grow different crops. There is much discussion as to how far it is necessary permanently to evacuate some of these marginal areas where rainfall is so unreliable.

Meanwhile, the Australian livestock industry expands rapidly. During 1937–38 exports of meat and butter were substantially higher than in the previous year. Further experimental observations were made on the shipments of chilled beef to Britain with the object of improving quality. Similarly the Egg Producers' Council is to bear half the cost of some research into wastage of eggs in shipment due to microbial attacks. From Western Australia the export of fat lambs was twice as large as in 1937, and it is confidently believed that this industry could be greatly expanded in the state. A highly important study has been published during 1938 on the conditions and future prospects of animal production in Australia. It stresses the need for relating livestock production to the herbage growth in different areas and for taking steps to improve the average quality of stock. (*See* Bibliography.)

Canada. There are in Canada approximately 730,000 farms covering about 160 million acres of which 58 million acres are in field crops. The most outstanding feature of Canadian agriculture production is the wheat crop which in 1938 occupied 26 million acres from which 358 million bushels were harvested. The yield of 13·8 bushels per acre is somewhat below the long term average but almost twice that of 1937 and is the largest since 1932.

In Eastern Canada, crop conditions could hardly be described as uniformly satisfactory for all areas. Quebec experienced a drought in the growing season and Ontario had too much moisture at harvest time. According to current reports the grain crops of these two provinces were about average. The fruit crops were also average, with the exception of grapes which showed a heavy decline. A reduction in cheese production of about 12% was partly offset by some increase in the output of butter. In the Maritime Provinces the fruit crop was a fair one and vegetables rather better than average; cereal and forage crops varied with the districts but on the whole were about average or slightly poorer. In British Columbia the fruit crop was fair but somewhat smaller than in 1937. Cereals and forage crops were, generally, considerably poorer than usual. The marketings of farm livestock of

all classes in the Dominion of Canada have totalled less than those of a year ago



The fall in cereals prices is proving disastrous for Canada As regards wheat, Manitoba No 1 which in Dec. 1937 stood at 13*s* per cwt. at Liverpool had fallen by the end of 1938 to 6*s* 6*d*. Similarly Canadian oats fell from 9*s* 7*d*. to 6s 4d per cwt., likewise barley (No 3 Western) from 8*s* 5*d* to 6*s* per cwt. The good harvest was most welcome after a series of poor years, but its beneficial effect had been almost neutralized by the collapse of prices and consequently only a moderate degree of recovery has been possible It is true that the Grain Board since August has guaranteed farmers a price of 80 cents per bushel for their wheat, but by October the market price at Winnepeg had already fallen to 60 cents, so that this undertaking will result in a heavy deficit at the end of the season

New Zealand. During 1938 some branches of this country's agriculture fared badly while others continued to prosper. The worst hit was the wool industry, prices in 1937–38 averaging 10*d*. per lb. as against 15·8*d*. in 1936–37, so that total receipts from wool export fell from £16 millions to £9 millions. Furthermore there occurred early in the year a serious outbreak of so-called facial eczema, affecting both cattle and sheep in the North Island. The government has provided £10,000 for a comprehensive programme of research into this disease

Mutton and lamb production were well maintained, and the number slaughtered at freezing works advanced from 11·3 millions to 12·4 millions There was also an increase in the number of cattle, calves, and swine slaughtered Export meat prices ruled higher than in 1937, the index rising from 161·5 (1936–37) to 168·0 (1937–38) Butter and cheese prices were similarly higher in 1937–38 though towards the end of 1938 they weakened, butter at London falling to 109*s* per cwt in December compared with 120*s*. in the previous December. The government is planning a considerable increase in the research and advisory services for the dairy industry. Plans are complete for the inauguration of a system of farm dairy instructors of whom there are to be 77, the whole scheme costing some £47,000, of which the State will contribute 40%. A sum of £4,000 has been allocated for more extensive herd-testing for mastitis. The testing of cattle at slaughter-houses shows that still over 7% are infected with tuberculosis, though the majority only slightly, but to undertake a substantial further reduction in the incidence of tuberculosis is considered too costly at present

The drought at the end of 1937 seriously affected the wheat crop, especially in Otago and in Southland, so that much was fed off. A substantially smaller acreage was finally harvested than in 1937 though the yield per acre—over 32 bushels—was no lower. The potato crop in 1938 was the heaviest for many seasons and provided an export surplus of nearly 50,000 tons. During the year a commercial treaty was negotiated with Holland, opening a market for New Zealand fruit in exchange for accepting Dutch machinery and cigars.

South Africa. Agriculture has taken some time to recover from the severe drought at the end of 1937. The 1937–38 wheat crop was far from adequate to meet domestic requirements; prices of wheat and flour rose; the government negotiated an agreement with millers and bakers checking this, and in October the Wheat Control Board came into existence to regulate the marketing of the crop and to supervise prices. Similar Control Boards are being set up under the Marketing Act for meat, dairy produce,

The Times]
UNLOADING SUGAR BEETS AT KING'S LYNN BY MEANS OF HIGH-PRESSURE JETS OF WATER

tobacco, dried fruit, and chicory. For maize a Control Board already exists, raising a levy of 1*s*. 6*d*. per bag on all producers in order to finance exports.

In the livestock industry the most important product is wool, which accounts for more than a third of all South Africa's agricultural exports (*see* CATTLE AND SHEEP).

Dairying has expanded enormously during recent years The output of butter doubled between 1933 and 1936 and cheese output increased nearly as much. Owing to the shortage of butter experienced during the 1937 drought, the government has decided to finance the storage of an extra 1½ million lb. in the 1938–39 season. An interesting experiment has been the State-aided Milk, Butter, and Cheese Scheme At present over 300,000 children are receiving at school half a pint of milk or one ounce of cheese per day, mostly free of charge; during 1937–38 over one million lb. of cheese and nearly one and a half million gallons of milk were thus supplied. Butter is sold to the poorer sections of the community at 6*d*., 5*d*, or 4*d*. per lb, according to quality (the ordinary retail price being 1*s*. 5*d*. to 1*s*. 7*d*). During the year over two and a half million lb. of butter have been sold to 43,500 families under the scheme, which for all three products has cost the State some £225,000.

In the sphere of general agricultural development the two most important current activities are livestock improvement and the measures taken against soil erosion. Under the Livestock and Meat Industries Act, 1934, farmers can have a whole district proclaimed a "cattle improvement area" in which only approved bulls are allowed. There are already 128 such areas; out of 115,000 bulls examined 58,000 were rejected, and as soon as sufficient replacements are made the standard for approval will be rapidly raised. The subsidy for the purchase of approved bulls has been increased to a maximum of £12 10*s*. per bull and £50 per applicant.

As regards soil conservation schemes the State gives a

subsidy of 33⅓% approved for work undertaken by farmers with a maximum of £250 per dam or £500 per farm. Up to the end of August 1938 during the first five years of the scheme £468,000 worth of dams had been completed plus £75,000 worth of other erosion control works In addition there were £1,150,000 of outstanding but approved dams and works.

United States. Although an extremely large acreage had been sown to wheat, the crop harvested in 1938 proved less heavy than expected owing to attacks of rust in several districts. None the less the United States will have an exportable wheat surplus for 1938–39 of 331 million bushels as compared with 198 million bushels in 1937–38. The hay crop was better than 1937 and 20% above the five-year average.

The price of wheat (Hard Winter No. 2) at Chicago stood around 120 cents per bushel in Oct 1936, 108 cents in Oct 1937, and 68 cents in Oct 1938. During 1938 the prices of other farm products also declined considerably, and the general worsening of farmers' position can be seen from the following :

Index numbers of prices paid and received by Farmers

(Pre-war = 100)

	Prices paid, including interest and taxes.	Prices received for products.	Purchasing power of farm income.
1927–29	167	145	87
1932	120	65	54
1936	129	114	88
1937	135	121	90
1938	128	95	74

Whereas in 1936 and 1937 the purchasing power of farm income had regained its 1929 level, there occurred a severe setback in 1938—not quite to the disastrous level of 1932 but to one similar to that of 1921 and 1934.

During the last seven years there has been widespread legislation to alleviate the farm situation. This took the form of higher tariffs, export bounties, destruction of crops such as cotton and coffee, benefit payments, quotas, soil conservation, allotments schemes, and price fixing. These governmental activities did not stem the decline that occurred in 1937–38 because they were attacking the problem of solving farmers' buying power by attempting to change the volume or shift the direction of production. But agricultural output can only be changed gradually over a long period of years ; moreover, although variations in farm income may be partly due to variations in the volume of production, it is increasingly realized that they are also due to changes in the general price level and to other factors not easily controlled. Incidentally it is worth noting that the urban consumer never receives the full benefit of low farm prices ; in Oct. 1938 the index of farm prices stood at 96 and that of retail food prices at 137.

Argentina. The importance of Argentine agriculture is centred in her grain crops, which in an average year provide exports making up over half the total value of all exports from the country. Due to adverse weather, the three main crops, maize, wheat, and linseed, all yielded disappointing results in the case of the 1937–38 crop year. Owing to severe frosts at the end of 1937, whole areas of the wheat crop were unharvestable, though the product of the Bahia Blanca Zone in the south was found to be of high baking quality. The following figures indicate the crop situation :

Areas Sown 1937–38	Production 1937–38	Areas Sown 1938–39	Estim. Prod. 1938–39
000 acres	000 met tons	000 acres	000 met. tons
wheat 19 2	5,029	20·9	8,600
linseed 7·0	1,539	6·6	1,620
maize 15 3	4,424	—	—

The 1938–39 wheat crop will probably be the second largest ever recorded , the linseed crop will also be considerable. This, combined with the current situation in regard to world supplies and price levels, made it necessary on Nov. 14, 1938, to fix official minimum prices of 7 Argentine paper pesos per 100 kg. for wheat, and $13 for linseed, in regard to new crop deliveries, to ensure that the farmer should receive at least the bare cost of production. Fixed minimum prices had been suspended since December 1936.

One of the problems of the Argentine grain trade has been that the crops are marketed within three or four months of being harvested. The recently established Grain and Elevators Commission has been rapidly building elevators at ports and along the railways, and in Aug. 1938 a decree was issued fixing at 20 million pesos the credits to be allocated for this.

The production of beef continued at the same level of previous years, but prices improved substantially. Shipments of chilled beef to the United Kingdom totalled £13·8 millions against £13·4 millions in 1937 (*see* MEAT), but towards the end of 1938 prices weakened. On the whole, whereas 1937 had been a relatively good year, in which farmers paid off some of their debts, 1938 was less favourable, particularly for crop farmers. Presumably the 1938-39 season will be worse, since the anticipated harvest, though very large, will not be large enough to offset the catastrophic fall in grain prices. A point of special interest during the year was the agreement reached with The Netherlands whereby a considerable sum of capital is to be devoted to land reclamation work in the Argentine, which land is then to be made available to Dutch settlers.

India. The land area of British India amounts to 666 million acres, of which 227 million acres are under crops, 90 million acres are forest, and 145 million acres are not available for cultivation. Rice covers 80 million acres, and wheat 25 million acres. During recent years great strides have been made in improving the varieties of crops and in finding new uses for by-products. For instance, Pùsa wheats are now sown on nearly 7 million acres, or over one-fifth of the total wheat acreage ; the area under improved varieties of sugar-cane has risen in the last ten years from 2·8% to 68% of the total sugar-cane acreage. Another line of advance, still in its initial stages, is the attempt to utilize the 10,000 tons of cotton wasted every year from the saw gins. Experiments have been made for turning it into chemical cotton, *i e.* purified cellulose, which with acetic acid can be manufactured into artificial silk. It also seems to be becoming commercially feasible to extract the acetic acid from molasses. Another investigation in progress is into the possibility of utilizing India's bamboo wealth for the manufacture of paper.

But perhaps the biggest problem for India is her live-stock industry. The cattle population numbers 215 millions, or nearly one-third of all the cattle in the world. India has far too many cattle—67 for every 100 acres of

Fox Photos]
MR. LLOYD GEORGE WATCHING A GYRO-TILLER, WHICH ROTATES AS WELL AS DIGS, AT WORK NEAR CHURT

crops compared with 25 per 100 acres in Egypt, a country in certain respects similar. Most Indian cattle are permanently half-starved, yield little milk, and accomplish little work Assuming only half the cattle population works and that one-quarter are too young or too old for work, there remain an average of two oxen per seven and a half acres. A pair could cultivate fifteen acres, if farms were not so split up and implements less primitive.

Despite the difficulty that in several states the slaughter of cattle is forbidden on account of Hindu religious principles, interest in cattle improvement is developing rapidly In Feb. 1938 the first All-India Cattle Show was held in the Irwin Amphitheatre at New Delhi. It included an especially fine exhibit of Hariana, Hissar, Hansi, Sahiwal, and Dhanni cattle from the Punjab. Indeed it has been proved that Indian breeds when bred selectively for 25 years are as good as any European breeds. It is now planned to establish herd books for the eight most important breeds of Indian cattle, and propaganda for milk-recording is also being extensively undertaken. The results of a village economic enquiry conducted in seven areas at the instance of the Viceroy showed that milk yields averaged 600 lb. per annum and that the average lactation lasted eighteen months. This was on holdings of seven to 23 acres each worked by an average of six to seven people. The consumption of dairy products amounted to no more than 10·16 oz. per head per day (in milk equivalent). Men drank more milk than women and adults more than children. Evidence of this kind shows the gravity both of the agricultural and of the nutritional problem.

Finally it should be noted that the government of India is publishing a series of volumes on the results of a survey showing the cost of production of the chief crops in eight different provinces.

Japan. Rice production in 1938 was 318,000,000 bushels in Japan proper, 169,000,000 bushels in Korea and Formosa. These figures show a slight decrease as compared with the preceding year. A surplus of 47,000,000 bushels has been brought forward from 1937, so that the supply of rice for this year in Japan is satisfactory.

During the year the Japanese government introduced a national insurance scheme for damage to the paddy and mulberry crops, which are two important agricultural products. It is hoped that this scheme will contribute toward greater economic stability in the districts chiefly concerned. It had already been found that the national insurance of livestock gives good results to that branch of farming, and that the national insurance of fishing-boats and forests has worked well in the fishing and forestry industries.

Denmark. Farmers have had a relatively prosperous year. Contrary to the experience of Australia and New Zealand, Denmark's butter prices did not fall to any very serious extent during the twelvemonth, and although egg prices fell somewhat, bacon remained at the, from the farmers' point of view, relatively profitable level of 104*s* per cwt Exports of butter to the United Kingdom totalled 2,365,291 cwt. in 1938, a slight rise in quantity; eggs declined to 9,511,000 great hundreds; and bacon also declined slightly to 3,389,192 cwt.

The system of the pig cards has successfully adapted bacon production to the limits set by Britain and other importing countries. The relatively low price for milk—6*d*. per gallon—has prevented any undue rise in the output of butter and cheese, while propaganda is doing much to increase the home consumption of these. At the same time, a good price for wheat and sugar beet has called forth a very much larger output, though there may be possibilities of still greater development in this directon. The importation of agricultural raw materials, *i.e* feeding-stuffs, can be to a considerable extent replaced by an increase in the home production of fodder crops, thus balancing the decline in exports. Many Danish agriculturists consider that roots—sugar beet and potatoes—could form a larger proportion of the diet of pigs and cows than they do at present. But to grow more roots would involve more labour, particularly casual labour, and labour is scarce in the countryside. For despite the fairly high level of industrial unemployment, there is a steady exodus from the country to the towns.

The Netherlands. The Netherlands depended for their agricultural prosperity on export markets, and in particular on the German market; but Germany now takes an insignificant amount of Dutch produce.

An extensive series of government measures is concerned with adjusting production of livestock products and horticultural produce to the diminished demand, partly by directly restricting production, partly by heavily subsidizing exports, a procedure which is financed mainly out of taxes on domestic consumption of certain foodstuffs, such as margarine and butter. This appears to have been successful. Pig prices are now remunerative, though the farmers would like to be allowed to produce more. Milk prices at 6*d*. per gallon are low in relation to costs of production, but output must be discouraged and, furthermore, costs can be and are being lowered by increasing the proportion of home-grown feed. The wheat acreage has been doubled in response to a guaranteed price, but sugar beet and potatoes are both restricted. Horticulture is also working far below capacity. The primary result is a great deal of agricultural unemployment.

The second important series of measures has been concerned with assisting in various ways the totally or semi-unemployed. Those who were primarily agricultural labourers are sent to work camps or receive money from their unions or from the commune. Those who are primarily smallholders, and whose income falls below 9 fl. per week receive assistance in kind, making their income up to that sum. They get fertilizers, fencing wire, feeding-stuffs, etc., but have in return to follow the instructions of the State agricultural advisors, who gradually teach them to rationalize their holdings.

Meanwhile the State is making gigantic efforts to increase the quantity of land. As a result of the Zuider Zee reclamation plans, 500,000 acres will be won back from the sea in the next thirty years This scheme is going to create several thousand new farms, and so increase the agricultural production which at its present level is already the principal embarrassment of the country

France. Since France is largely self-sufficient in foodstuffs the central problem is to adjust the inevitable fluctuations of production (seasonal and annual) to the more stable demands of the consuming public and to secure reasonable prices for the producer, who is generally small and in a weak bargaining position. For instance, in 1938 the Wheat Office had to dispose of a very considerable crop surplus To finance exportation and denaturing, it has imposed a tax on all producers varying from 18 francs per quintal (*1s* per cwt) on farmers producing less than 200 cwt., up to *2s 6d* per cwt. on those producing more than 2,000 cwt. Thus the guaranteed price of 200 fr per quintal (*11s. 3d.* per cwt) is in effect reduced to 182 francs or even to 155 francs. It is worth noting, however, that only 7% of the wheat is produced by farmers in the latter class, more than half comes from those producing less than 200 cwt. each.

A need is also felt for some scheme of milk marketing In September, the producers' and wholesalers' organizations negotiated an agreement establishing milk quotas for the big Paris wholesale firms and a fixed retail price of 2 francs per litre (approx *1s. 1d.* per gallon) which is enforced by the threat of cutting off the retailer's supplies Another important development in the dairy industry has been the growth of milk recording. Whereas in 1932 there were only 49 milk-recording societies covering some 16,000 cows, by 1938 this had risen to 91 societies controlling 30,000 cows.

As between France and her North African departments there is some clash of interest in agricultural policy. Algeria can produce wheat, wine, mutton, certain fruits, and vegetables at much lower prices than can France, and since she is an integral part of the mother country, no tariffs can be imposed At present the French market is sheltered from a flood of Algerian products by means of "voluntary" quotas. But Algeria is a country with few economic resources apart from her agriculture and she is capable of producing a great deal more than she is now allowed to.

Germany. The recent trends of German agricultural policy are all in the direction of increasing self-sufficiency. For instance, to combat the deficiency in fats compulsory milk recording was introduced a year ago for all cows on farms where more than three cows were kept. This, together with the compulsory licensing of bulls, will, in a few years' time, it is anticipated, raise the milk yield of cows considerably above the present average of about 575 gallons. Unfortunately, the outbreak of foot and mouth disease in 1938, which touched nearly half the farms in the country, caused a substantial though temporary setback in milk production. The second important deficiency which it is possible to remedy is in the supply of feeding-stuffs. This problem has been tackled in a number of ways. As a result of plant-breeding experiments, a maize has been produced which ripens even in the north of Germany and is said to yield 50% more food value per acre than the oats which it is displacing. Similarly a variety of soya bean yields tolerably good crops in the south.

In order more generally to stimulate production, agricultural prices were raised in 1934–35 nearly 20%, but since then have been held level, so as to prevent any further increase in the cost of food. Wholesale and retail prices of foodstuffs are likewise controlled Furthermore, the distribution of available supplies is directed from a central office. For instance, cattle dealers have first to satisfy the needs of the locality in which they operate before selling to more distant destinations They have to announce their intentions eight days in advance to the *Kreisbauernschaft.* This is reported to the provincial cattle marketing board which passes on the information to the Reich office Dealers are then told to what towns they must send their surplus

In general the price-fixing and other measures have led to a considerable rise in the price of land, which is widely considered the safest form of investment at present.

The 1938 cereals crop totalled 25·9 million metric tons, nearly 1,000,000 tons more than the record crop of 1933 The yields of potatoes and sugar beet were also good though not quite up to the record harvest of 1937. Some difficulty was experienced in maintaining milk production, mainly because of foot and mouth disease; but for this German scientists have produced a new serum which is said to give very satisfactory results. The year was also marked by intense labour shortage in agriculture despite the presence of 400,000 foreign workers. The harvest was accomplished only with the help of shock gangs from the army, from labour camps, and from schools.

Italy. As elsewhere, the wheat harvest was good, amounting to 297 million bushels compared with 296 million bushels in 1937. The fixed price of wheat was increased from 122·75 lire to 135 lire per quintal. Other crops also yielded well. Most classes of livestock showed some increase in numbers as against 1937, though all except cattle (7,670,000) were fewer than in 1930. A propaganda campaign is being launched to promote greater self-sufficiency in livestock products.

AIR CONDITIONING. A further increase in the desire for and acceptance of air conditioning, because of its benefits to comfort and health, was noted during 1938, more particularly in the United States, in South America, and the West Indies. South Africa continues to support a reasonable air-conditioning activity. Europe and Asia, with the exception of India and the Malay States, have thus far shown relatively little interest in air conditioning.

Air-conditioning Technique. A very few large installations of the central plant type were installed during the year. In those which were installed, there exists a definite trend towards multiple unit, high-speed refrigerating compressors, rather than the heavy, large, slow-speed compressors of previous years. Also, the factory-fabricated unit assembly conditioner continued to find increasing acceptance.

The application of the self-contained or unit type of conditioner is rapidly broadening. Reliable small, air-cooled conditioners are now available at fairly moderate price. These units provide about three-quarters of a ton of cooling capacity. (Equivalent in cooling effect to the melting of three-quarters of a ton of ice in 24 hours.) They are readily installed, and provide for the cooling, dehumidifying, circulation, ventilation, and air filtering of the average room in the house, flat, hotel, or office.

For large offices and small shops, self-contained water-cooled air conditioners are now available up to about ten tons of cooling capacity. These units may be applied to single large rooms with air delivered directly into the room from the unit, or they may be applied to a group of rooms such as a suite of offices or a house, with a simple duct supply and return system Complete summer air conditioning is provided, including cooling, dehumidifying, circulation, ventilation, and air cleaning. All these self-contained units may be used in the winter for circulation, ventilation, and air cleaning. Also, heating and humidifying may be added as accessories to many of these units for winter-time operation.

Summer air conditioning, with gas as a source of energy, marks a growing trend. Such a system may take the following forms :

(*a*) Mechanical compression system with gas-engine drive.

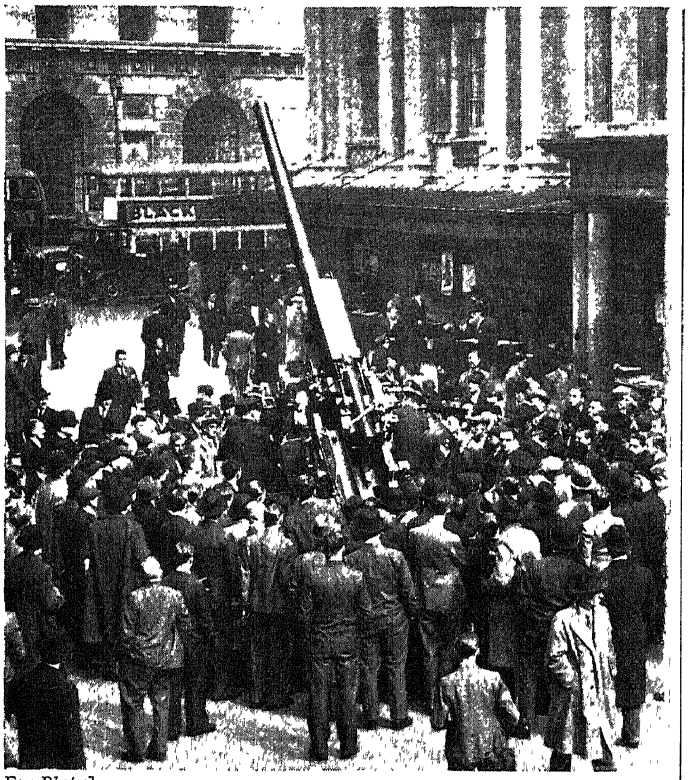
(*b*) Adsorption system with gas as the source of regeneration

(*c*) Absorption system with gas as the source of regeneration

(*d*) Gas-fired steam ejector system.

Systems of all four types are in successful operation now, but considerable developmental work remains to be done, before such systems are commercially practical and before they represent standardized, reliable, quietly operating systems, purchasable at moderate cost

Winter air conditioning, particularly of the direct-fired type, was more broadly accepted in 1938. Such systems are available at moderate cost for gas, oil, or coal firing ; and they provide for heating, humidifying, circulation, and air cleaning. Ventilation can be added for year-round service, if desired, and cooling and dehumidifying for summer use can be added at the time of installation or later, using the same blower, filters, and duct system already installed for the winter conditioning.



Physiological Benefits. It has long been believed that air conditioning offers certain definite benefits to health ; but except for the definitely proved relief provided to hay fever and pollen asthma sufferers, these benefits still remain to be fully identified by the medical profession. Particular investigations are under way on the destruction of various air-borne bacteria and upon the effects of air conditioning on post-operative cases and common cold sufferers.

AIR DEFENCE. For a country with land frontiers the defence of its soil has always been the main aspect of its military problems, but for an island country " home defence " was until recent years subsidiary to the maintenance of sea-power. Now, however, it claims a foremost place in all military calculations. By the irony of fate this new situation has developed just as the old risks, which had existed for centuries, seemed to be diminishing to zero. The experience of 1914–18 showed that the invasion of a country by forces that had to be carried across the sea had become increasingly hazardous for the invader. Although Britain kept a great number of troops at home to guard against such a danger, it never arose—and it is known that the Germans never seriously contemplated an invasion. Now, with the great growth of air forces, the attempt to land large forces on a hostile coast would seem to have become more difficult than ever in face of the quantity of shore-based aircraft which can be swiftly concentrated at any point to bomb the transports. On the other hand, the advent of air power has brought a new danger—of devastation, panic, and paralysis—to the cities in the interior and to the ports which feed them. The risks tend to grow disproportionately to the rising scale of possible attackers. Even in land warfare an artillery bombardment attains its effect by plastering an area, and so multiplying the chances of hitting a particular target within it, rather than by the particular shells striking where intended. A bomb-dropping aeroplane is still less a weapon of precision than a gun. So much of its effect depends on chance, that great effects can only be expected where the number of aircraft in a raid on any objective is such as to multiply the chances very heavily An attack by ten aircraft may score less hits of significance than an attack by five aircraft, whereas an attack by 100 may do much more than ten times the damage.

The " chances ", however, depend as much on the number and density of the targets which a country offers as on the number of aircraft employed in the attack. Unfortunately, of all great countries England is, with the exception of Japan, the most vulnerable to air attack. And Japan is far less accessible, besides having a population whose type and standard of living make it less dependent for its essential food on supplies brought from a distance. In London, the largest centre of population is combined with the chief port through which not only its own inhabitants but those of other centres are fed Moreover, the metropolis lies closer to the Continent, and thus to the points from which air attack may come, than any of the other important ports or cities. The adverse nature of England's " industrial geography " has been worsened by the tendency of factories to move down from Lancashire and elsewhere to the London area, as well as by the general citywards drift of population.

The reduction of national vulnerability should be the first concern of any scheme of defence framed to meet the modern conditions of war. It embraces measures for the dispersion and concealment of works which may form likely targets ; the duplication of sources of essential supply, so as to limit the effect of damage to any one of them ; the evacuation of the population so far as possible from specially endangered areas ; the provision of bomb-proof or splinter-proof shelter for workers in and inhabitants of such areas ; the organization of emergency services to give warning of impending attacks, to maintain order, to clear debris, to deal with outbreaks of fire or the dissemination of gas, and to restore communication. In Great Britain most of these measures have hitherto come under the Home Office, and the responsibility for carrying them out has been entrusted to an Air Raid Precautions organization—" A.R.P." for short—formed on a local basis.

Beyond such measures of " passive defence ", the state of a country's readiness to meet air attack depends partly on its own air force and partly on ground defence. The defence in the air acts both directly and indirectly. The direct defence against enemy bombers is entrusted to fighter aircraft, whose operations are aided by searchlights from the ground, and is supplemented by various protective devices, of which the balloon barrage is the best known example ; but there is also the indirect defence provided by the counter-offensive power of bomber squadrons against the enemy's country, including the bases from which his attacks may be delivered. The general defence from the ground is provided by anti-aircraft guns, whose fire is aided by searchlights, and may be supplemented by new devices for crippling the attackers. In Great Britain the responsibility for the ground defence of the country is entrusted to the War Office. To the way in which that responsibility has been fulfilled the remainder of this article will be devoted, since the state of the anti-aircraft defences had an important effect on the foundations of British policy during the crisis

Fox Photos]
DEMONSTRATION OF A 3·7-IN ANTI-AIRCRAFT GUN OUTSIDE THE MANSION HOUSE, LONDON

of 1938, while the state of defence *in* the air is more appropriately discussed in the article AIR FORCES.

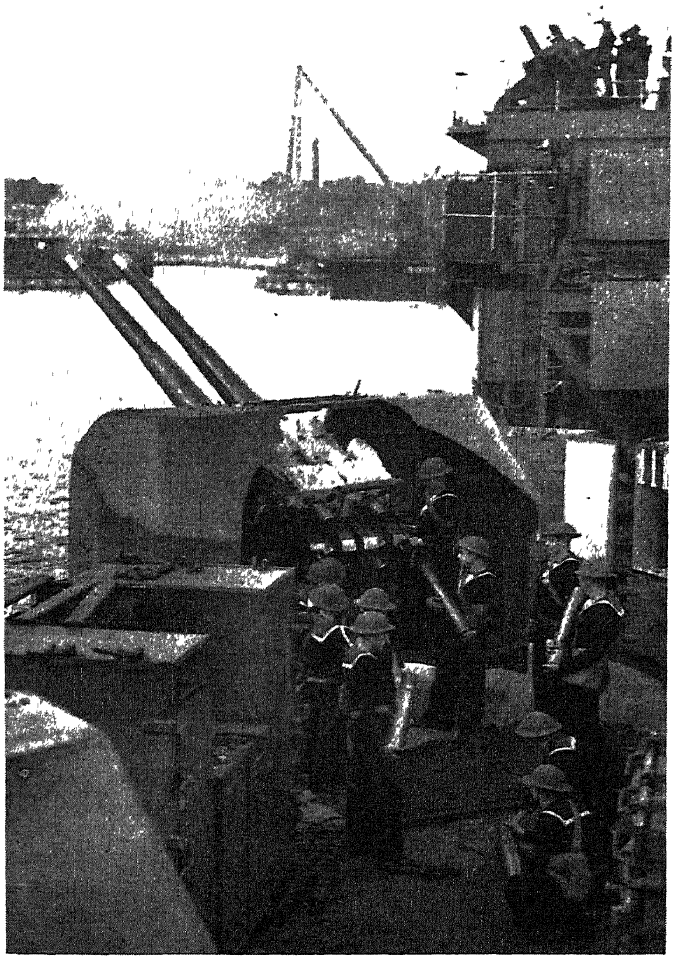
In the reconstruction of the Army during the years following the World War, the manning of the anti-aircraft defence as well as the coast defence of Great Britain was allotted to the Territorial Army, thus leaving the Regular anti-aircraft troops free to accompany any expeditionary force that might be sent overseas as well as to protect naval bases on the Imperial communications. The scale of protection provided both at home and abroad was very small, and its needs received little attention even when measures of rearmament were undertaken.

Early in 1935 two Territorial air-defence brigades were available for the defence of Great Britain , they comprised a nominal total of barely 100 guns, and the actual number that would have been ready for use had war come suddenly was much less. At a rough calculation the money devoted to them was in the region of £100,000 a year, out of the average of £40 millions that the War Office, which held responsibility for the anti-aircraft defence of the country, had been receiving yearly since the War. In the spring of 1935 the government announced a great acceleration of its general rearmament measures. As a small part of the programme one of the fourteen Territorial Infantry Divisions was converted later in the year to form an Anti-Aircraft Division, the 1st, for the protection of London and the South of England. Another year and more elapsed before a 2nd Anti-Aircraft Division was formed, partly by another conversion, at the end of 1936, to provide some defence for the North and Midlands. The small scale of the provision for anti-aircraft defence had been acutely felt when the tension with Italy over Abyssinia developed in the late summer of 1935. To meet the needs of Britain's Mediterranean garrisons, the stocks of anti-aircraft ammunition at home had to be drained. The guns, moreover, were the three-inch guns of the last war pattern, and although they were described as having been modernized, this amounted to a change of liner, or inner tube, which merely enabled the crew to repair a gun on the spot instead of sending it away The maximum height to which the shells could reach was barely 20,000 feet, while the effective ceiling was little more than 15,000 feet.

As for the searchlight position, the number of lights required for the zone of the 1st Anti-Aircraft Division was about 1,050, on the minimum scale then approved. In the summer of 1936, it could assemble about 120 in emergency, and some of these could be obtained only by borrowing from the Coast Defences Equipment was lacking even for training

In the autumn of 1937, out of the forty-five new headquarters which were needed by the 1st A A. Division, two had been completed. Guns available numbered sixty and searchlights 200. The position of the 2nd A A Division was no stronger The guns were the old three-inch pattern, and the issue of the new and greatly improved 3·7-inch gun was not in sight. This is stated to have a ceiling of about 40,000 feet and the size of its shell burst to be about four times as effective, while the time of flight to the target has been nearly halved—a very important factor in view of the great speed of modern aircraft. None of the new sound-locators were yet issued, nor were the new height-finding and range-taking instruments.

The crisis of Sept. 1938 revealed to the public what was widely denounced as a state of grave deficiency. Experts added that defects of organization made the degree of Britain's unpreparedness much worse relatively than was warranted by the actual state of her rearmament. It was not until after the shock caused by Germany's occupation of Austria in March that the authorities had improvised measures for manning the defences in emergency, aimed—some said over-optimistically—at getting the units into position in twelve hours. By mid-September the approach of the European crisis had become clear. It was not, however, until Monday, Sept. 26, that the calling out of the anti-aircraft personnel was sanctioned. If the crisis had suddenly come to a head during this interval London would have been unprotected by ground defence, and any fighter aircraft would have been unable to operate at night for lack of searchlights to direct them on to their quarry.



Fox Photos]
SEARCHLIGHT AND LISTENING-POST MANNED BY MEN OF THE TERRITORIAL ARMY

Thanks to the thoroughness of divisional and unit arrangements the process of calling out the anti-aircraft forces worked smoothly in most cases. So far as could be gauged, a considerable proportion of the guns were in position within twelve hours and the bulk of them within twenty-four hours. The second day came, however, with hardly any aircraft available to give them the necessary practice in acclimatizing themselves to their instruments. And many troubles had been discovered with those which had been issued from store.

The mobilization has inevitably disclosed the extent and position of Britain's defences to foreign as well as British observers. But this is weakened as an argument for postponing mobilization by the fact that reference to the current Army List and previous Army Estimates would, by an easy calculation, have given the total number of guns for London's defence as little more than a hundred. This may be regarded as a hazardously small number, but besides it was reported that, after six days of mobilization, perhaps almost half of the guns issued were not capable of engaging an attacker, Some were said to be out of action because the predictors were lacking or defective ; some for lack of dials ; some because the batteries were not charged ; some because they arrived without any instruments at all. It is said that certain units which had sent lorries to the Ordnance depots to collect their equipment were kept waiting or even sent away because official formalities were clogging the procedure of issue. For much of the ammunition delivered at the gun-positions, a different type of fuse was issued from that for which the units were prepared. The modern 3·7-inch guns did not appear to amount to much more than a fifth or a sixth of the guns available—though parliament had gained the impression in the spring that deliveries were already substantial.

It was only in the spring of 1938 that steps to meet the danger of low-flying attack were approved in principle, The creation of the organization to deal with it was, however, postponed, so when the crisis came it was hastily arranged, for lack of proper weapons, to employ ordinary Lewis guns (light machine-guns) supplemented by old naval three-inch guns. Lack of sufficient specially trained personnel then proved a handicap in utilizing the weapons that were provided. If an attack had come, this improvised defence against low-flying attack might have been more dangerous to civilian life and property than to the attacking aircraft ; for the old naval three-inch guns were fired by the obsolete Case 1 method (over open sights), which makes them, when firing shrapnel, easily affected by the natural excitement of the firers. The handling of Lewis guns is even more susceptible to this influence. The scheme for organizing the local defence of vulnerable points against low-flying attack was finally announced on Oct. 14, after the crisis was over.

What are the causes behind the unsatisfactory condition which the crisis brought to light ? Partly, it may be suggested, the reluctance of the government in the past to accept the financial burden involved in raising the scale of the defences to the level indicated by strategic considerations. Partly, differences of opinion between the War Office and the Air Ministry, together with the feeling of each service that the ground defence of the country against air attack is not its natural sphere. Such a tendency on the part of the Air Force was suggested in the summer of 1938 by the way that practice camps were ill-supplied with suitable aircraft targets, and by the fact that senior air officers did not visit them. The War Office long showed

Keystone]
ANTI-AIRCRAFT GUNS OF H.M.S. "SHEFFIELD" IN ACTION, REPELLING A MOCK AIR ATTACK AT CHATHAM

a similar attitude. Some two years ago a close examination of the problem of home defence suggested that the projected scale of guns and searchlights ought to be at least doubled to provide adequate safeguard against air attack. The General Staff made it clear that their main concern was with the formation and equipment of field army for use abroad and that they tended to regard money devoted to air defence at home as money taken from "the Army". In the winter of 1937–38 the new Secretary of State for War, Mr. Hore-Belisha, was instrumental in gaining formal priority for the needs of air defence. But the actual inauguration of the expansion agreed on was put off until the autumn.

A further main cause of the delay in producing the weapons and instruments required, and developing new methods, may be set down as the lack of any centralized organization to deal with the problems and control the anti-aircraft forces. The men actually responsible for anti-aircraft defence were outside the War Office and had to deal with some eight different authorities in securing action. Inside the War Office responsibility was distributed among various departments, and by junior officers in them. It was not until the summer of 1938 that an additional Deputy Chief of the Imperial General Staff was created for anti-aircraft defence, while a single command outside was created. But the powers of the former office were limited by keeping a large part of its natural functions under other departments, and to both of the new lieut.-generals' posts were appointed major-generals who lacked

previous experience of anti-aircraft work, to the disregard of the two major-generals hitherto responsible. Able as they were, it could not but be suggested that time would be lost while they were picking up the threads of the problem. Since, again, the officer who had been selected as the new Deputy Chief of the Imperial General Staff was out in Egypt as head of the military mission, and it was intended to leave him there until November, the new organization had not begun to function in any real sense when the crisis came in September.

What are the most urgent lessons of last autumn's experience ? In the first place, it may be suggested that the time has come for the full step of placing the whole of the anti-aircraft sphere under a single and separate department of the War Office, headed by someone who has mastered the problem from experience. It might even seem wise to constitute the air defence of the country, civil and military, as a fourth service, under a Minister of Defence. Secondly, it might be a wise precaution to create a permanent anti-aircraft covering force, to quicken the process of deployment, by providing the Territorial anti-aircraft units with sufficient Regular personnel to maintain their equipment in a state of constant readiness. Thus in emergency the Territorials would merely have to be rushed out to fill up a defensive framework of guns and searchlights already established in position. The Continental countries have thought it necessary to have a frontier guard constantly ready, yet Britain has no such insurance against surprise, continuing to rely on forces which can only be called out from their civil occupations when the emergency is certain. To call out the whole of the Territorial anti-aircraft forces inevitably arouses public excitement, and for that reason there is a danger that it may be delayed too long in a time of international tension The system has hitherto provided no intermediate precautionary measures between complete defencelessness and the complete mobilization of the Territorial anti-aircraft forces. (B. H. L. H.)

AIR FORCES. It is difficult, if not impossible, to find a simple common denominator on which to compare the real relative fighting strength of the air forces of the world. In warfare on the ground or at sea, armies and fleets form a barrier between the peoples of the warring nations and the attacking forces of the enemy, and before victory can be attained this barrier must be destroyed: fleets are therefore pitted against fleets and armies against armies, and all other things being equal, the gauge of superiority lies in numerical strengths.

The same conditions do not exist in air warfare, since the air provides a medium through which a blow can be struck direct at the people of a country, without the destruction of the opposing air force being a necessary prelude. The striking value of an air force must therefore be measured directly in proportion to its ability to carry out this function. For this reason a mere comparison of relative numbers may be, and very often is, misleading. As it is, however, a convenient and easily presentable method, it has come into general use, and the term "first-line aircraft" has been adopted as the measure of numerical strengths. "First-line aircraft" means the number of aeroplanes actually on the establishment and available for service in formed units.

In addition to these first-line aircraft, an air force must have a number of aircraft, in everyday use, at its various flying schools and other establishments, and the number of these would be in proportion to the number of the first-line aircraft. That is, a country with a large first-line strength would have to maintain a proportionately larger number of aircraft in its instructional establishments than a country with a smaller number of first-line aircraft.

In calculating striking strengths for war purposes, the possible influence of big civil transport aircraft must not be ignored The machines employed on the German civil air lines played an important part in assisting the creation of Germany's air force.

Finally, there are reserves. Prior to the rush to rearm commencing in 1934, first-line aircraft in air forces were numbered in hundreds, and the aeroplanes themselves were mainly built of wood and fabric and, being of comparatively simple construction, cost about £3,500 each. The maintenance of reserves presented neither a costly nor a complicated problem, and most countries aimed at maintaining such reserves on a scale of three or four reserve machines for each first-line aircraft.

It is very doubtful if reserves on this scale will be possible in the future, since not only have first-line strengths grown, but the prices of aircraft have increased to as much as 800 per cent of their cost a few years ago. Furthermore, the creation of extensive manufacturing resources tends to diminish the necessity for maintaining large stored reserves. The present indications are that the larger Powers are aiming at keeping reserves to the extent of fifty per cent to one hundred per cent of their first-line aircraft strengths.

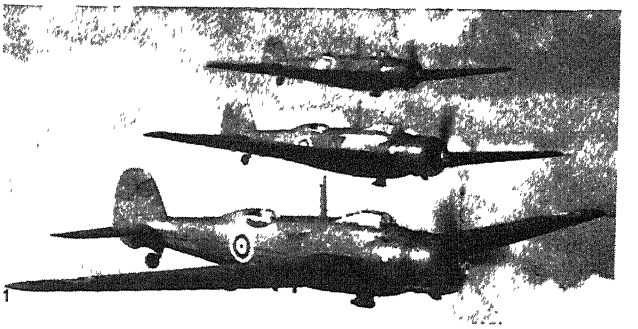
The following numbers indicate, approximately only, relative first-line strengths, with possible reserves, of the stronger air forces of the world:

U.S.S.R.	. .	4,000	first-line aircraft	with	50	per cent	reserve
Germany	.	3,000	,,	,,	,, 50	,,	,,
Britain	. .	2,200	,,	,,	,, 25	,,	,,
Italy	. .	2,000	,,	,,	,, 25	,,	,,
U.S.A.	. .	2,100	,,	,,	,, 30	,,	,,
France	. .	1,900	,,	,,	,, 20	,,	,,
Japan	. .	1,300	,,	,,	,, 50	,,	,,
Czechoslovakia		500	,,	,,	,, 25	,,	,,
Poland	. .	500	,,	,,	,, 20	,,	,,

Considerable differences exist in the basic organization of air forces. Certain countries believe that the air arm will be employed on major operations of war independent of either Navy or Army, and have developed their air forces as a distinct and separate service.

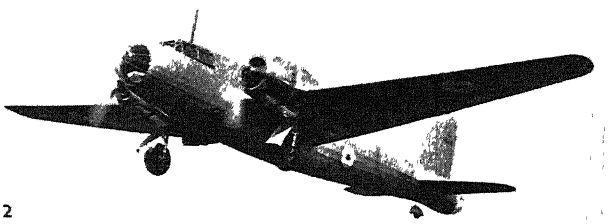
Britain was the first country to separate the air arm from the other fighting services and to develop it as a force with a separate administration and independent command, under the control of its own Minister and Department of State; making that Department responsible in addition for the provision and maintenance of such aeronautical material and personnel as might be required by the sea and land forces This example was subsequently followed by Italy, France, and Germany, the latter with this difference, that the Minister for Air is responsible to the Reich Minister for War who is commander-in-chief of all the armed forces.

In Britain the original centralized organization has undergone a certain modification, and in 1937 it was decided that the Royal Navy should administer and develop all that side of the air force which was required directly for use with the Naval forces. The Air Ministry is now in the process of handing over its responsibilities in these respects to the Admiralty.



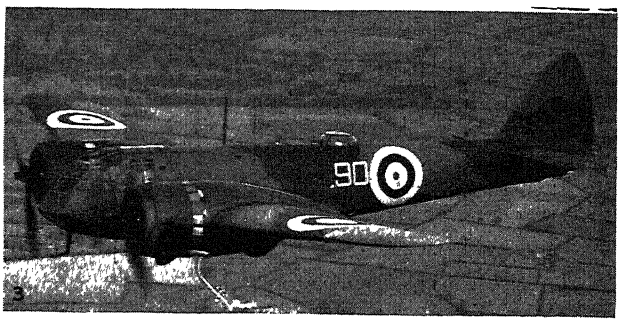
The United States of America and Japan, on the other hand, have retained their air forces as an integral part of their sea and land forces. In the U.S.S.R. the air force forms part of the Army, and the lesser Powers have

incorporated their air forces in previously existing services.



Russia. The Russian air force is quantitatively the largest in the world. Whether it is qualitatively the equal of its neighbours is becoming doubtful, since the greater portion of its strength had already been created during the period in which considerable technical changes were taking place in the world of aviation, and it is reasonable to doubt if the bulk of Russian equipment is keeping pace with the rapidity of modern development. It may be argued from experiences in the Spanish Civil War that Russian aircraft, both bombers and fighters, have shown performances fully equal to that of the aircraft of other countries, but the aircraft in Spain appear to have been samples of modern production and it is doubtful if re-equipment is progressing in Russia on a scale and at a rate which will bring her vast numbers up to present-day standards. As is to be expected of an air force mainly designed for working with an army, the largest proportion of its aircraft are fighters, attack aircraft for use against ground objectives, reconnaissance types and light bombers. Russia has, however, developed a heavy bomber capable of carrying big loads for long distances, and it is estimated that she has between 400 and 500 of this type Much of the organization and progress in Russia has been directly due to the employment of foreign technical advisers on a large scale. The services of these advisers are gradually being dispensed with, and it remains to be seen if the technical progress already made is maintained.

Germany. An important particular in which the German air force differs from other air forces is that the control of the whole ground-defence system, including guns, searchlights, balloon barrages, etc , is centred in the Air Ministry. The evolution of the German Air Force, its speed of expansion and its technical re-equipment, has been remarkable. In March 1935 the German Chancellor announced the creation of the German Air Force in defiance of the prohibitions imposed by the Peace Treaty of Versailles. The strength, according to his announcement, was equal to that of the total British Air Force, *i e.* it was judged to be something between 600 and 800 aircraft. The methods by which a force of this strength was produced suddenly and without warning are worthy of note, since the civil organization, which enabled it to be produced, is still in existence. In 1930 Germany brought into being an organization termed the "Air Sports Association" in order to co-ordinate all those aviation activities which were outside the scope of the commercial air transport concerns. For purposes of administration, Germany was divided into sixteen areas, and each area was divided and subdivided until the convenient unit of a sub-group was reached. There were some 10,000 of these sub-groups throughout Germany, and to each was entrusted the task of training the youth of its particular district to proficiency in the varied ground trades of an air force and in flying. Members were enrolled as young as sixteen. Training was, in this way, carried out on a territorial basis throughout the whole country, while control was retained in the hands of a central body. Thus it was the "Air Sports Association" which provided the very broad foundation on which the German Air Force was constructed.



At the present date the first-line strength of the German Air Force is estimated as between 3,000 and 3,500 aeroplanes, and its composition as originally organized contained a very high proportion of bombers to fighters. Of the bombers the majority are of a medium-size, high-speed, small-load (half a ton of bomb) type. As a result of

experiences in Spain, where it has become the practice for bomber formations to be escorted by fighters, it is likely that the proportions of fighters to bombers will be increased, and the function of a specially developed fighter extended to escort duties. The general organization of the German Air Force is peculiar to itself and aims at a very high degree of decentralization, each general officer commanding being entirely responsible for all air force activities, including recruiting, training, and defence, in the area under his command. Operational units are free of all responsibilities in regard to maintenance and repairs, which are carried out by a special corps, mostly on a civilian basis and recruited direct from the technical colleges and the engineering industry.

Britain. The strength of the British Air Force, in March 1935, when Herr Hitler announced the existence of the German Air Force, was about 850 first-line aircraft, but the foundation which was actually available on which to commence the expansion project was only some 35 squadrons, owing to the absence in the Mediterranean and elsewhere, during the Abyssinian campaign, of the remaining squadrons. It was on this very narrow base that the expansion programme was carried out and to this was largely due the personnel difficulties that have been encountered. At present there are two parallel processes of expansion continuing at the same time: the expansion of the Royal Air Force to a figure which must ultimately be governed by the growth of the German Air Force, and the expansion of the Naval Air Service to meet the increasing commitments of our growing fleet, to a probable total of about 700 first-line aircraft. Hitherto the proportion of bombers to fighters in the British Air Force has been accepted as two to one, but this proportion is likely to undergo modification, since it seems inevitable that the number of fighters will increase in relation to the bomber strength. The majority of the bomber squadrons are armed with a high-speed, medium-range, medium-load, bomber. Hitherto the fighter defence has been based on the employment of a single-seater machine fitted with fixed forward-firing guns. This policy appears to be undergoing a change, as a two-seater free-gun fighter, comparable in speed with its single-seater contemporary, has been adopted to supplement the fighter defence.

Italy. Although Italy's first-line strength appears to be about 2,000 aircraft, the actual strength available for concentration at home is considerably less than this, since her commitments in Libya, East Africa, and Spain must have absorbed at least 25 per cent of her available total. One of the chief aims in Italian aircraft development has been the production of a fast long-range bomber to dominate the Mediterranean, and in 1935 it is probable that she possessed in the "Savoia 79" the most efficient long-range type in Europe. Recent developments indicate that she is still concentrating considerable energy in improving this type of machine. Italian aircraft constructors still adhere to a method of construction employing both wood and metal, which makes for flexibility and cheapness in production. Of her total aircraft strength approximately half are bombers. She has also to some extent followed American practice in building a high proportion of "attack" aircraft for low-flying attack on ground objectives.

U.S.A. America maintains its air forces as adjuncts to the Navy and Army, each separate air arm being administered by the State Department of the parent Service. The American Naval Air Service is controlled and manned entirely by officers and men of the regular Navy, and all combatant ships of suitable size carry their own complement of aircraft, varying from three on battleships and cruisers to 76 on aircraft carriers. The functions of the service are to provide for the needs of the fleet, and to this end specialized types of aircraft have been developed, which tend more and more to differ from those developed by the Military Air Service. Military Aviation, or the Army Air Corps, comprises (*a*) the air forces assigned to G.H.Q. Air Force, (*b*) those constituting an integral part of armies and corps, (*c*) those assigned to overseas service, and (*d*) those assigned to the zone of the interior. The administration and control of the Army Air Corps within the limits of the United States is vested in General Headquarters Air Force, and the Chief of the Air Corps is adviser to the War Department which controls everything connected with military aviation.

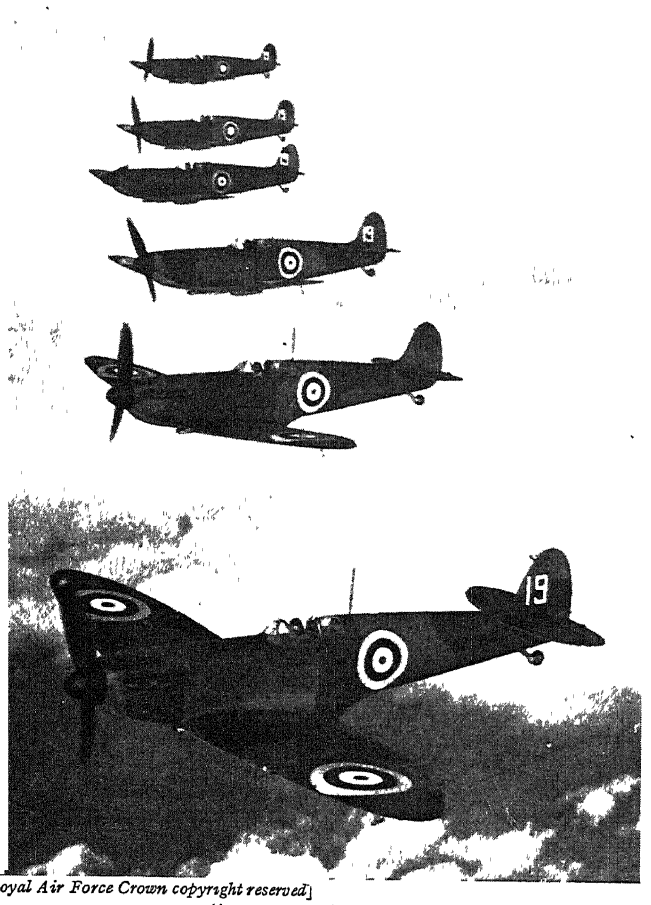
France. France, from leading position amongst the air powers of the world, has dropped to sixth place as regards air strength. Of her total of rather less than 2,000 aircraft, at least 25 per cent are stationed in her North African colonies, the Levant, and Indo-China. While, at the commencement of the race to rearm, she was in the most favourable position as regards numbers to carry out an expansion programme, she has failed to keep pace with the expansion of any of her neighbours and, owing to a series of industrial troubles, the re-equipment of her squadrons with modern types has been retarded. The reorganization of the Air Force commenced in 1935 was abandoned at the beginning of 1938 and a new organization has been adopted. Hitherto the French Air Force has been organized mainly in the light of army requirements, with a correspondingly large proportion of relatively short-range, reconnaissance, bomber, and fighter types of aircraft. New types, however, indicate a change of policy, and concentration on the production of the large long-range heavy bomber has already commenced. All her Air Forces are administered by the Air Ministry, but ship-borne aircraft form an integral part of the naval forces, and naval co-operation aircraft, not carried on board ships, are at the disposal of the Minister of Marine.

Japan. The Japanese Air Force, like that of America, is divided between her Army and Navy, each Air Service being under the control of, and administered by, its parent Service. During the progress of the war in China considerable changes have taken place as regards both numbers and types of aircraft. The proportion of bombers to other types has been greatly increased, and modern machines of comparatively long range (1,000 miles) have replaced the old types. The total air strength is roughly divided between the naval and military services, and an increase in both air services is in project. (L. L. M.)

AIRPORTS. In England, the traffic control is subject to the Air Ministry, in accordance with the recommendations of the Maybury Committee An Air Ministry training school is providing the highly skilled personnel usually recruited from former transport pilots. Four controlled areas are in operation: the London-Continental area (including Croydon and Lympne), the Heston area, the Portsmouth area, and the Isle of Man area, further areas being contemplated.

The following airports are at present under Air Ministry control · Croydon, Heston, Manchester (Barton and Ringway), Portsmouth, Doncaster, Southampton, Kirkwall, and Renfrew.



New important civil aerodromes opened during 1938 are Cambridge, Ringway near Manchester (250 acres), Luton, and Wolverhampton. A considerable number of military aerodromes and landing-grounds have been created by the Air Ministry. Further additions to the number of civil aerodromes are progressing well. At the end of 1937 there were 98 licensed aerodromes in the United Kingdom and eleven aerodromes under construction. Most aerodromes are municipal ones, the government owning only four civil aerodromes in England.

The problem of subsidizing aerodromes was discussed at the conference of the Aerodrome Owners' Association early in 1938. It was stated that during 1936 and 1937 the total losses of 28 civil aerodromes amounted to £137,107. There are standard landing fees for all aerodromes (9*d*. for every 1,000 lb. of the permissible loaded weight of the aircraft in question). The government has done its best to encourage the construction of new aerodromes, but dissatisfaction has been voiced with regard to the rental procedure followed by the Air Ministry.

The problem of a central airport for London has not yet been solved, in spite of all efforts. Croydon, Heston, and Gatwick are not considered suitable for future development. The City of London Corporation decided to spend £600,000 at Fairlop Plain (Essex), but this site appears to have since been dropped as unsuitable. Imperial Airways and the Southern Railway collaborated in plans for a site at Lullingstone (near Swanley Junction). Another proposal is for an ariport at Mucking; this would offer the advantage of a combined seadrome and aerodrome, provided that a control of shipping would permit the use of the river Thames at Lower Hope Reach for seaplanes.

Another unsolved problem is the provision of a final terminus for the flying-boat service with the Empire. The plans for a civil seaplane base at Langstone Harbour appear to have be turned down by Portsmouth for financial reasons. A Southampton scheme is being prevented by the veto of the Admiralty.

On the Continent the Tempelhof aerodrome at Berlin has become one of the most lavishly built airports. Its site has been extended, so that the landing area forms an oval shape whose dimensions are no less than 2,750 × 1,850 yds. All around is a wide concrete apron about four miles in length. Miles-long sheds and administrative buildings have been erected after demolition of the existing ones. Grandstands for a seating accommodation of more than 60,000 spectators are provided. Factory chimneys and church towers have been restricted in the neighbourhood of this airport. For the purpose of loading and unloading aeroplanes, a special apron of a quarter-mile length with a wide canopy over it is provided. The cost of this airport is said to exceed £5 millions. The completed airport will be

For the purpose of loading and unloading aeroplanes, a special apron of a quarter-mile length with a wide canopy over it is provided. The cost of this airport is said to exceed £5 millions. The completed airport will be

opened during 1939, landing-ground and part of the buildings already being in use.

One of the largest and most modern equipped airports is Le Bourget, near Paris, the longest runway of which is 8,100 ft. While at the time of the opening the new terminal building was considered more than adequate for the next two decades, a project for a new and still larger civil airport near Paris is already being studied. The present airport combines a military and a civil aerodrome.

At Lisbon a big modern airport is under construction. It is intended for the future transatlantic services via the Azores, for which a stop has to be provided in Portugal, according to agreements Portugal has concluded with Great Britain, France, U.S.A , and Germany. It is reported that the new airport will be constructed with British assistance.

The Dutch government intends to convert the recently enlarged Amsterdam airport at Schiphol into a purely military aerodrome, and to provide a new commercial airport near Leyden (25 miles from Amsterdam) A fierce opposition has been raised against this project.

An expensive airport has been created at Bromma, near Stockholm, partly out of the rock. More than £600,000 had to be invested in its construction. The airport is provided with four long concrete runways. The new Stavanger seaplane base is Norway's first civil airport. A new civil airport at Oslo is well under way. Helsinki (Finland) has provided a civil airport especially laid out for the requirement of blind approaches.

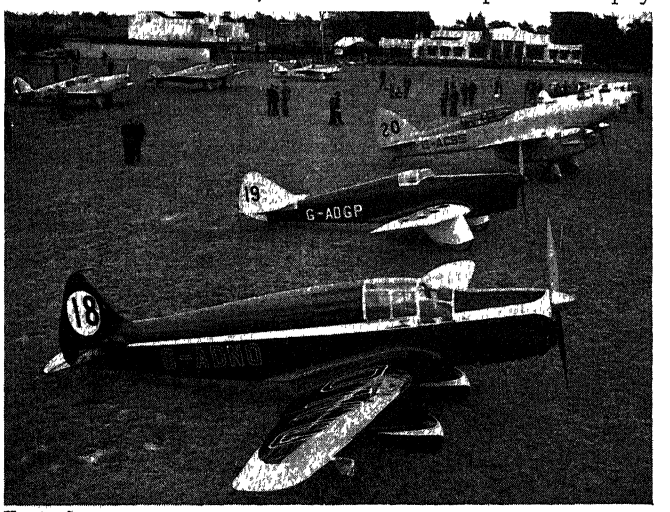
In Asia, one of the most important aerodromes has become the combined land and sea aerodrome at Singapore. This modern airport, with 250 acres of landing surface and unobstructed surroundings, has a domed surface (upward slope 1 in 160) and is underdrained by forty miles of pipes. A waterway of 600 ft. width connects the mooring area with the outer harbour.

Another combined land and water aerodrome is the new airport at Basrah ('Iraq). It provides well-sheltered reaches for big flying-boats.

The South African government is spending £100,000 on the provision of a new flying-boat base at Durban Bay, on a site which is very near to the city. Eventually a new civil aerodrome will follow. A number of aerodromes and emergency landing-grounds is under construction in South Africa. The important Rand airport near Johannesburg is being enlarged.

Newfoundland's new civil airport near Gandar Lake will be of special importance for the northern transatlantic air routes. The total area provided for this airport is 770 acres, with an aerodrome size of 250 acres. The night lighting system makes use of a flare path with modern electric equipment, including collapsible boundary lights, because of the frequent fogs. Generally, flarepaths are by now considered obsolete for night landing on aerodromes, and floodlighting has become the rule, except for night alightings with seaplanes. The Newfoundland airport is provided with four concrete runways. (A. R. W.)

In the United States, the Civil Aeronautics Authority controls over 22,994 miles of domestic airways equipped with lights or radio beacons or both, and the total of equipped airways is now 33,239 miles. This system links together 1,277 municipal, State, and commercial airports and includes 267 government emergency fields, with a total of 718 airports and fields equipped for night flying. Part of this was constructed during the depression in connexion with unemployment relief, and the Works Progress Administration contributed sums which will total more than $86 millions by 1939.



During 1938 perfection of the " Terrain Clearance Indicator " was accomplished and this device should be of tremendous aid in blind landings, as it indicates the distance from the terrain below regardless of the altitude with respect to sea level. A recent noteworthy construction is New York's new airport at North Beach, which was constructed by the heroic method of filling in some 400 acres of Flushing Bay to provide a total of 550 acres and permit runways up to 6,000 feet long. Built by the city with the assistance of the Works Progress Administration, at a total cost of around $28 millions, this airport's opening date has been set for April 30, 1939. Pan-American Airways' chain of facilities across the Pacific remains one of the most daring airport developments of recent years. This organization now operates 53,166 miles of route, has 172 " ports of call " and (including other airports and emergency facilities) has more than 300 bases in all. The Pacific chain includes many unusual airports, one being the Wake Island base which had to be constructed on a tiny and formerly uninhabited island over 1,000 miles from the nearest other land in the Pacific. Despite the difficulties surrounding such construction, less than six months elapsed between inception and actual completion of the entire Pacific chain.

AIR RACES AND RECORDS. The handicap for the King's Cup took place on July 2, 1938, over a triangular course (twenty laps, 1,012 miles) from Hatfield Aerodrome ; eighteen out of the nineteen competitors finished, and the average speed of the winner, who also did fastest time, was 2½ m p.h. greater than last year's—itself a record and on a machine of similar make. The first three were : A. Henshaw (Percival Mew Gull), average speed, 236¼ m.p.h. ; G Guthrie (Percival Mew Gull), 220½ ; L. H. T. Cliff (Miles Hawk Major), 146¼ ; the respective handicaps were : 11 min. 4 sec., 18 min. 17 sec , and 2 hr. 40 min. 26 sec.

The eighth annual race from London to Cardiff (this time including Swansea), 192 miles, was won from scratch after an exciting finish on Sept. 10 by G. R. de Havilland, who was first both for speed (average, 187½ m.p.h.) and on handicap (41 min. 44 sec.), out of a field of six. He flew a T.K 2, entered by Viscount Wakefield.

The only international event was the 26th race for the Gordon Bennett Cup. One Swiss, two Polish, three Belgian, and three French balloons started from Liége on Sept. 11, and the winner, *i.e.* the entrant landing nearest to the place that he had previously declared, was Polonia II (Polish), which reached Pojizena, Rumania (1,030 miles), on Sept. 18.

In the United States, the Golden Gate Exposition Trophy

Keystone]

PLANES ASSEMBLED AT HATFIELD FOR THE KING'S CUP AIR RACE

was won at the first annual Pacific Air Races on May 30 by Earl H. Ortman, at the record speed of 265·5 m p h This speed was beaten in September by Col. Roscoe Turner, who won the Thompson Trophy at Cleveland flying at 283·419 m p h.

Records. A great number of record performances and long-distance flights were achieved during 1938. Only a few outstanding performances may be mentioned.

A E Clouston flew with a passenger in a De Havilland Comet monoplane from England to New Zealand and back (27,000 miles) within twelve days, requiring 4 days 8½ hr for the journey from England to New Zealand.

Howard Hughes flew from New York to Paris, Berlin, Moscow, Omsk, Yakutsk, Fairbanks, Minneapolis, and back to New York with a Lockheed 14 twin-engined transport 'plane and a crew of four—a distance of 15,000 miles in 3¾ days.

A formation flight from Rome to Rio de Janeiro in two days with a landing at Dakar was accomplished by three Italian aeroplanes in January. A greater performance was a long-distance flight by three British R.A.F. single-engined landplanes, with a non-stop flight from Egypt to Australia.

A flight from Berlin to Tokyo was made in December by a German Focke-Wulf Condor four-engined air liner (8,500 miles in 46 hours, with landings at Basrah, Karachi, and Hanoi). One passenger and a crew of five were carried. The same landplane (with Captain Henke and Flight-Capt von Moreau) had flown before from Berlin in a non-stop flight to New York (3,942 miles), and, after a short landing, back to Berlin in 25 hours' flying time ; the starting weight amounted to eighteen tons.

After a start by composite launch, the Short-Mayo Mercury four-engined floatplane flew from Dundee with mail to South Africa (5,997 miles) on Oct. 6–8. The same aeroplane had flown during July from Foynes (River Shannon, Eire) to Montreal, and from there to New York, in about 25 hours' total time.

An "unintentional" transatlantic crossing from New York to Baldonell (Eire) was performed by Douglas Corrigan during July, with an old Curtiss Robin three-seater aeroplane. (*See* also AVIATION, CIVIL.)

AIR RAID PRECAUTIONS: *see* AIR DEFENCE ; NATIONAL SERVICE.

AJMER-MERWARA is an isolated district of British India in the Rajput States ; area, 2,771 sq. miles ; population 560,292. The Chief Commissioner for the area (Mr. A. C. Lothian) is also the Governor-General's Agent for Rajputana. Merwara is hilly and sparsely cultivated ; Ajmer, aided by plentiful irrigation, grows cotton and the cheaper food grains. Some 78 per cent of the population are Hindus ; Western Hindi and Rajasthani are the prevailing languages. The capital, Ajmer (pop. 119,524 ; founded A.D. 145), is the seat of the Mayo College, for the education of young Rajput nobles, and a big railway centre. Seven miles away is Pushkar, India's most sacred lake. (ME.)

ALASKA. The area of Alaska is about 586,400 sq. miles, one-fifth that of the United States. The population (1930 census) was 59,278 (white, 28,640 ; Indian, 29,983). The chief products are fish, metals, and fur. In 1938, fish and fish products shipped from the Territory were valued at $50,225,025. Of this amount, $42,677,210 represents the value of canned salmon alone, which is the principal industry of the Territory. The total value of mine products shipped to the United States in 1938 was $28,693,088, of which the gold shipments amounted to $18,575,002. Furs valued at a total amount of $3,312,865 were shipped from Alaska during the calendar year 1937, an increase of nearly $400,000 over the previous year.

Improved transport, particularly improved aerial transport, is Alaska's chief need. The outlook for further aerial development through the co-operation of the Alaska Aeronautics and Communications Commission with the Federal Government was very good in 1938. Scheduled air routes will soon be in effect between Puget Sound and Fairbanks and possibly Nome, as well as other points in Alaska. As new routes are added this will open up much of the Territory which is now inaccessible.

Largely owing to the development of the Matanuska colonization project, there has been a marked increase shown in agriculture, particularly in the Kenai peninsula country, where Homer is the centre of agricultural development. Scores of farmers settled there during 1938. This and other settlements are deserving of all possible encouragement.

Tourist travel continued to increase, and during the summer of 1938, all ships plying to Alaska carried capacity loads.

ALBANIA. M. Kotta's cabinet remained in office, changes of personnel, without political significance, being made in May. Foreign relations were unchanged, and continued most cordial with Italy. Progress was made with communications, notably the important roads Shkodra–Theth, Shkodra–Kukës, Burrel–Peshkopi, Tirana–Ndroq–Durrës, Elbasan–Devoll–Korça, Saranda–Butrinto. Sub-prefectures previously abolished were restored, 42 new Communes created, and the foreign names of many villages Albanianized. Evidence of a new outlook in education was revealed in the substitution for all "town schools" (lower secondary) of "work schools", where

Planet News]
KING ZOG AND QUEEN GERALDINE OF ALBANIA AT THEIR WEDDING, APRIL 27, 1938

instruction is mainly agricultural, technical, and commercial; 22 more elementary schools were built, classes for illiterate adults, having proved successful, were extended Activity continued in the improvement of land, agriculture and stock; all fishing rights were contracted to an Italian company for 25 years. The Agrarian Bank opened three branches; and the National Bank of Albania erected new headquarters, now the most imposing building in Tirana.

British organization of the Gendarmerie ceased The first broadcasting station, 3 kw. short wave, was inaugurated at Tirana on Nov 28. The Pope appointed an Apostolic Delegate; and four Moslem sects formed a central religious and cultural organization, "Drita Hyjnore" (Celestial Light).

King Zog married, April 27, Countess Geraldine Apponyi of Hungary. On Sept. 1 the tenth anniversary of the proclamation of monarchy was celebrated. (D. R. O. H.)

Area and Population:
Area (approx.) 10,800 sq. miles.
Population (est. Dec. 31, 1936) 1,100,000.
Chief Towns: Tirana (30,806), Scutari (29,209).
Ruler. King Zog I.
Language. Albanian.
Religion. Moslem 71 per cent, Albanian Orthodox 19 per cent, Roman Catholic 10 per cent.
Production 1937:

Wheat	39,900 metric tons
Maize	137,900 ,, ,,
Oats	11,200 ,, ,,
Tobacco (1936)	1,600 ,,
Wool (,,)	2,100 ,, ,,

Overseas Trade (000's omitted):
Imports (1936), 16,300 gold francs; (1937) 20,300 gold francs.
Exports (1936), 7,200 gold francs; (1937) 10,200 gold francs.
Finance:

Revenue, ordinary (1937–38)	21,600,000 gold francs
Expenditure ,, (,,)	21,100,000 ,, ,,
Public Debt	68,200,000 ,, ,,
Notes in circulation (Oct. 31, 1938)	11,000,000 ,, ,,
Gold Reserve (,, ,,)	7,600,000 ,, ,,
Exchange Rate (Dec. 1938)	20·60 gold francs = £1 sterling

Roads: about 1,200 miles suitable for motor traffic.
Defence: compulsory service of 18 months; strength, army, 13,000 approx.

ALBERTA. The year was a bitter one for Mr. Aberhart and his Social Credit cabinet. It began with the rejection of the appeal of two of his prominent supporters, sentenced to prison for criminal libel in a pamphlet entitled *Bankers' Toadies*. It continued with the Canadian supreme court's disallowance as unconstitutional of bills passed earlier to tax banks and control credit and the Press, a judgment later upheld on appeal by the Privy Council. The budget could hardly bring joy to a Social Credit heart, being drawn on orthodox principles, imposing heavy new taxation and, even so, calculating for a deficit of $1,500,000. Economies introduced included the closing of Government house, a saving in upkeep of $20,000 a year. During the June elections in neighbouring Saskatchewan Mr. Aberhart and a team of lieutenants stumped the province on behalf of the 41 Social Credit candidates who had been put up, but only two of these were successful. Further Alberta taxation measures were disallowed by the Dominion government in the same month. In December Mr. Aberhart announced that under present circumstances, Alberta would not be able to redeem the $3,500,000 bonds maturing in Jan. 1939. During the year the question was raised of

Fox Photos]
VALLEY OF TEN PEAKS, BANFF NATIONAL PARK, ALBERTA

separating the Peace River block of Alberta and British Columbia to form, with Yukon, a new territory or province of the Dominion. Mr. Aberhart, on the other hand, wanted to see Alberta's area extended up through the north-western territories to the Arctic, thus increasing the extent of the province from 255,000 to 500,000 sq. miles.

Alberta emerged in 1938 as one of the great oil-producing areas of the British Empire, production from the Turner Valley fields topping 7 million barrels, compared with 2,075,338 in 1937 and 1,320,442 in 1936. In April an Oil and Gas Conservation Act was passed and a board set up for the regulation of production.

Area and Population:
Area 255,285 sq. miles.
Population (est. 1937) 778,000 (Indians 15,249).
Chief towns (pop. 1931 census): Calgary (83,761), Edmonton (79,176), Lethbridge (13,489).

ALEXANDER, SAMUEL, British philosopher, was born of Jewish parentage in Sydney, New South Wales, on Jan. 6, 1859, and died at Withington, near Manchester, on Sept. 13, 1938. After a school and university education in Melbourne, he proceeded to Balliol College, Oxford, where he took a First Class in Classical Moderations,

Mathematical Moderations, and "Greats". He was a Fellow of Lincoln College, Oxford, from 1882 until 1893, and from 1893 to 1924 was professor of philosophy in the Victoria University of Manchester Alexander was a Fellow of the British Academy, was president of the Aristotelian Society from 1908 to 1911, Gifford Lecturer at Glasgow from 1916 to 1918, and Herbert Spencer Lecturer at Oxford in 1927. He received the Order of Merit in 1930 His publications include *Moral Order and Progress*, 1889 (which won him the Green Moral Philosophy Prize); *Space, Time, and Deity*, 1920, 2nd impression 1927; *Spinoza and Time*, 1921; *Art and Material Beauty*, 1925; and *Beauty and Other Forms of Value*, 1933.

ALGERIA. The year 1938 was marked by a return to calm and by an economic revival.

The local propaganda of a nationalist and revolutionary character which had been carried on by *L'Etoile Nord-africaine* was checked by the condemnation, on Jan. 14, of its leaders and the arrest of their substitutes on March 31.

The Ulemas, doctors of Moslem law, who are working for the restoration of Islam in Algeria in accordance with the cultural and religious ideals of Pan-Arabism, held a congress (Sept. 23–25) in Algiers. This congress resulted in an important split. Sheikh El Okbi, an influential Algiers theologian, broke with the society directed by the powerful Ben Babis of Constantine, whose irreconcilable opposition to the French government showed no signs of abating even during the international crisis of September. He set up a new religious society in opposition to the Ulemas, its name being El Islah el Islahi (Moslem Reform), and its objects purely moral and social.

In spite of the efforts of the Moslem Congress, to unite the natives into a "permanent Co-ordination Committee", in association with the Left Wing political elements of the Popular Front, the demands put forward became less violent In January the Moslem deputies, who had resigned in a body, resumed their co-operation with the government with a view to supporting the Blum-Viollette bill which would grant the electoral rights of French citizens to the 20,000 natives retaining their personal status.

This proposal met with steadfast opposition from the French colonists, and the February elections to the Financial Delegations, which vote the Algerian budget, showed a swing by the French electorate towards the extreme Right. The acceptance in March of the Blum-Viollette proposal by a commission of the chamber led to the resignation of hundreds of mayors and councillors, who only resumed their positions after the *Anschluss* The government then temporarily shelved the proposal.

Algeria's trade during the year increased by 36 per cent over 1937 For the first time in five years, the 1937 budget showed a surplus of 200 million francs, and the 1938 budget seems likely to give similar results. The estimates for 1939, are: revenue 1,910,000,000 francs; expenditure, 1,909,000,000 francs.

During 1938 the Governor-General concentrated especially on affording assistance to native cultivators, both by installing them in co-operative groups on the land available, and by giving them loans of money, seed, or tools provided by the native provident societies.

A new organization, the Commission d'Études du Haut-Comité Méditerranéen, consisting of equal numbers of representatives of Islamic ministers and technicians on the one hand, and native Algerian delegates on the other, sat for the first time in Paris under the presidency of M. Chautemps with a view to the study and improvement of the native system of métayage, the Khammessa (Dec. 13–17). (C. A. J.)

ALIMENTARY SYSTEM, DISORDERS OF. Under this heading are treated certain disorders which are of particular interest because of the frequency with which they are encountered in all parts of the world.

Gastroscopy. Among the instruments discovered in the surgeon's house at Pompeii was a speculum for examining the interior of the rectum. Perhaps the most important advance in gastro-enterology of recent years is the invention by Schindler of a flexible gastroscope, by means of which the interior of the stomach can be inspected with complete safety and with a minimum of discomfort to the patient. Whereas the X-rays had made it possible to recognize the deformities of the stomach caused by ulcers and growths, the new method has revealed for the first time the changes in the mucous membrane caused by gastritis, and has provided a means of recognizing ulcers and growths so small that they may escape discovery with the X-rays. Many patients who would formerly have been diagnosed as suffering from "nervous dyspepsia" are now known to have an organic basis for their symptoms in the form of gastritis. As malignant disease never develops in a healthy stomach, the early recognition of chronic gastritis and chronic gastric ulcer and their adequate treatment, followed by the institution of a simple regime to prevent recurrence, may be regarded as constituting a real prophylatic treatment of cancer. The importance needs no emphasis when it is remembered that in Great Britain alone about 15,000 people die every year from cancer of the stomach.

It has long been known that aspirin causes digestive symptoms in many people. Gastroscopic observations have shown that this is due to the production of acute inflammation of the mucous membrane in immediate contact with swallowed particles of the drug, which may even give rise in exceptionally susceptible individuals to severe hæmorrhage. The moral to be drawn is that aspirin should always be taken in a finely divided form with plenty of water, and that it should be avoided by all patients who have at any time suffered from ulcer or other gastric disorder.

Alkalosis. Many gastric disorders, including ulcer, are associated with a high acidity of the gastric juice. The symptoms can often be temporarily relieved by alkalis, although the underlying condition remains unaffected. As most disorders of this kind are very chronic, patients often continue to take alkaline powders in large doses for very long periods. The excessive consumption of alkali may eventually lead to the development of an alkaline condition of the blood, which causes headache, loss of appetite, irritability, and other symptoms, though these are rarely recognized as being the result of "alkalosis". The patient may continue to dose himself with his favourite brand of powder until finally he develops such severe symptoms as convulsions and coma, which may even prove fatal, though they are likely to be mistaken for the result of the "uræmia" of latent kidney disease by a doctor who is unaware that the patient has been poisoning himself for years with alkalis. Steps should be taken to control the extensive advertising of these alkaline powders without any warning of their potential dangers. Fortunately, a quite harmless and equally effective substitute has recently been introduced in the form of magnesium trisilicate. Still more important is the recognition that the correction of such common causes of indigestion as septic teeth, inefficient dental plates, irregular and hurried meals, "chain smoking" and excessive consumption of alcohol, especially in the form of cocktails or other strong drinks on an empty stomach, together with the prescription of a simple diet will often make the use of drugs of any kind unnecessary.

Intestinal Auto-intoxication. The conception of poisoning by products of bacterial activity in the bowel—auto-intoxication—is very widespread. The last few years have confirmed the belief long held by many authorities that this conception has no scientific foundation. It is now recognized that the symptoms which are often ascribed to constipation are really the result of the toxæmia caused by the artificial diarrhoea, which is produced by drugs taken by the patient for his supposed auto-intoxication. Intestinal lavage for a hypothetical poisoning from the bowel is almost equally harmful, and it has the additional ill-effect of making a patient, often already too introspective, still more hypochondriacal. Constipation itself produces no serious toxic symptoms. Its unpleasant effects can be overcome by regular habits, a suitable diet, and the administration of liquid paraffin or unirritating vegetable mucilages, which increase the bulk and soften the fæces, and thus render them more easy to expel.

The Stomach and Blood Formation. One of the most remarkable recent developments in physiology has been the recognition that the stomach not only secretes a juice containing hydrochloric acid and pepsin which digests proteins, but also produces ferments, hæmopoietin, and neuropoietin, which react with certain constituents of the food to form substances which are stored in the liver and act as the stimulants required respectively for the normal production of blood and the nutrition of the central nervous system. Pernicious anæmia, which had been regarded as "idiopathic" since it was first described by Addison a century ago, and subacute combined degeneration of the spinal cord, are now known to result from inflammation or atrophy of that part of the gastric mucous membrane which secretes hæmopoietin and neuropoietin. This explains why these diseases can be cured by the administration of dried stomach and by liver extract. (A. F. H.)

AMERICAN FEDERATION OF LABOR, senior of the two great rival United States Labour organizations, was formed at Columbus, Ohio, in 1881, and on Aug. 31, 1938, consisted of 102 national and international unions, 1,517 local trade unions in the United States and Canada, 49 State federations, and 792 city central bodies, with a membership of 3,623,087. It lost a membership of approximately 1,000,000 in 1936, when it suspended the Committee for Industrial Organization unions, but during the following year the Federation redoubled its organization efforts, and regained in new members most of the C.I.O. loss. The president of the American Federation of Labor is William Green, a former coal miner and former official of the United Mine Workers of America. He was elected president Dec. 19, 1924.

The financial report of the Federation, beginning Sept. 1, 1937, and ending Aug. 31, 1938, showed that the balance on hand, Aug. 31, 1937, was $586,567.41; the total receipts for the twelve months ending Aug. 31, 1938, were $1,844,203.37 and the total expenses for the same period were $1,987,139.59, leaving a balance in hand Aug. 31, 1938, of $443,631.19. (*See* also CONGRESS OF INDUSTRIAL ORGANIZATIONS; TRADE UNIONS, STRIKES AND LOCKOUTS, UNITED STATES; LABOUR.)

AMERICAN LITERATURE. "Average" is perhaps the best word with which to summarize the contributions of the year 1938 to American literary history. A due quota of good books in various fields was published, about the expected number of talented new-comers appeared in fiction and elsewhere, there were no notable shifts in established reputations, and only one striking loss by death, that of the novelist Thomas Wolfe.

In the more creative phases of writing, such as fiction, poetry, and, to a lesser degree, biography, no noticeable new trends were seen. The historical novel continued to dominate the best-seller lists, and even appeared to be increasing its hold on the popular interest, although it had relatively little competition from other classes of fiction. Women, too, continued to write most of the best-sellers.

The most popular novel of the year was Marjorie Rawlings' *The Yearling*, a simple story of a boy's life in the Florida back-country. Laura Krey's *And Tell of Time*, a first novel, proved the continuing popularity of the Civil War and Reconstruction periods as literary material. The surprise best-seller of the year was Margaret Halsey's *With Malice Toward Some*, the acid and witty comments of a young American woman on the ways and customs of the English. No book of the year was more widely read and commented upon than this volume, which sprang from letters Miss Halsey sent back to friends during a stay in England.

Novels. In general, the established novelists did no better during the year than hold their own. Among the disappointments were Sinclair Lewis's *The Prodigal Parents*, a heavy-handed satire on the revolt of youth; Pearl S. Buck's *This Proud Heart*, an inconsequential story of a swollen feminine ego apparently mistaken by the author for genius; and Hervey Allen's *Action at Aquila*, a conventional Civil War romance lacking any of the romantic sweep and glamour of *Anthony Adverse*.

William Faulkner's *The Unvanquished*, a collection of short stories of the Sartoris family woven into a novel, won its author critical praise and new friends for the simplicity of the writing. Esther Forbes scored again with *The General's Lady*, a Revolutionary War novel slighter in theme than her fine *Paradise*, but exceptionally well done. Elizabeth Madox Roberts turned to a love story, with overtones, in her *Black is My True Love's Hair*, and gave it a distinction that has marked all her books, without the obscurity of *He Sent Forth a Raven*, its immediate predecessor. Branch Cabell swung back to an earlier period with *The King Was in the Counting House*. Josephine Lawrence kept easily to the high level of her "problem novels", bitterly realistic treatments of everyday phases of American life, with *Bow Down to Wood and Stone*. James Farrell was generally thought to have made an advance in *No Star Was Lost*, a continuation of his current book on life among the Irish of the Chicago slums.

John Steinbeck's collection of short stories, *The Long Valley*, contained some of the finest work to date of this talented young writer. Ernest Hemingway's contribution to the year's lists consisted of *The Fifth Column*, and *The First Forty-Nine Short Stories*, *The Fifth Column* being a war-time play laid in Madrid, and the short stories representing the author's complete work in this genre.

Among the new-comers to fiction, Allen Tate, already established as a poet and biographer, added a distinguished novel to the historical list with *The Fathers*, a Virginia story of Civil War days. The characterization was exceptional and the rhythmic prose beautiful without seeming strained or artificial. A woman writing under the pseudonym of Taylor Caldwell produced a widely read novel, *Dynasty of Death*, which told the story of a family of munitions makers, and impressed, despite certain weaknesses, by its panoramic narrative sweep and the timeliness of its subject.

Other noteworthy first novels included George R. Stewart's *East of the Giants*, a California pioneering story; Harold Sinclair's *American Years*, an account of the growth of a Middle Western village; and Evelyn Hanna's *Blackberry Winter*, another story of Georgia in the Civil War and Reconstruction periods. Wessell Smitter's *F.O.B. Detroit* was one of the few notable pieces of fiction of the year that dealt with contemporary problems: it told the story of an automobile factory workman who could not adjust himself to the assembly line. Dorothy Baker's *Young Man With a Horn* also came out of the contemporary scene, a strangely touching little story of the life and death of a swing-crazy musician.

Bertha Damon's *Grandma Called it Carnal*, based upon the author's close acquaintance with an actual New England grandmother who stood out against all new-fangled things, delighted many readers with its native humour and the sharpness of its portraits.

Biography. Carl Van Doren's long and detailed *Benjamin Franklin* was one of the most discussed books in this field. Other important works included an editing of the famous William H. Herndon papers on Abraham Lincoln, freely used in the past as basic biographical material, by Emanuel Hertz. Published as *The Hidden Lincoln*, this provided an invaluable close-up of a great man in his formative period. C. Van Woodward's *Tom Watson, Agrarian Rebel*, was a careful and thoughtful study of a prominent figure in the Populist movement of the 1890's, and threw light, not only on Watson and his significance, but upon many later developments in Southern politics. Harry Barnard's *Eagle Forgotten: The Life of John Peter Altgeld* revived the memory of a great American liberal with fairness and justice.

Philip C. Jessup's two-volume *Elihu Root* was another fine piece of work which combined history with a penetrating study of a personality, and William Allen White's *A Puritan in Babylon*; *The Story of Calvin Coolidge* was

not only the best interpretation of Coolidge yet made, but one of its author's most mature and finished books. Oscar Lewis's *The Big Four*, the story of the men who built the Central Pacific Railway, Huntington, Stanford, Hopkins, and Crocker, was a rich piece of Americana, filled with legendary material about one of the vital phases of the opening of the Far West.

Of the year's autobiographies, none attracted more attention than James A Farley's *Behind the Ballots*, in which Mr. Farley not only told of his own rise to power, but explained the principles of a practical politician with disarming candour.

As history and autobiography, the second and concluding volume of *The Letters of Henry Adams* ranked high. The period covered was between 1892 and 1918, and the careful editing of Worthington Chauncey Ford gave the final touch to one of the most important records of this kind available This was one of the year's books certain to survive, a permanent contribution to a nation's culture by a personality that would have been remarkable in any age or time *The Letters of Lincoln Steffens*, edited by Ella Winter (Mrs. Steffens) and Granville Hicks, was another collection of correspondence worthy of note, the honest and complete revelation of the mind of a modern liberal journalist, and a first-hand account of the significant events of his lifetime.

History. Notable among works of historical importance was a five-volume set of *The Public Papers and Addresses of Franklin D. Roosevelt*, with special introductions and explanatory notes by Mr. Roosevelt, a record covering the years between 1928 and 1936, and later to be completed. It was the first time so extensive a collection of official documents had ever been published during a President's term of office.

T. J. Wertenbaker launched the first volume of a new series to be called "The Founding of American Civilization", which was entitled *The Middle Colonies*. Warmly human in its approach, it emphasized the everyday details of life among the American nation's founders. Matthew Josephson's *The Politicos* was an excellent companion volume to his *The Robber Barons*, covering the 1865–96 period from the political angle, and making a fascinating, if appalling, record of graft, greed, and corruption during a period of epochal financial and industrial development. Robert Selph Henry, author of *The Story of the Confederacy*, produced *The Story of Reconstruction*, destined to be a source book for future workers, although somewhat over-detailed for the general reader.

The task of telling a continent's story through its rivers proceeded with two additions to the "Rivers of America" series, launched in 1937, Cecile Hulse Matschat's *Suwanee River: Strange Green Land*, and Struthers Burt's *Powder River: Let 'Er Buck*, a particularly lively account of the West in legend and history, which was generally received as the best volume of the series to date.

Poetry. Archibald MacLeish essayed a somewhat unsuccessful experiment in *Land of the Free*, in which he supplied the "sound-track" for a series of photographs of Americans caught in the depression. Although the poetry itself was often quite moving, it lost a good deal of its effectiveness because of the typographical arrangement of the book, and even without this handicap, would have done little to increase Mr. MacLeish's reputation.

With the exception of Leonard Bacon's *Bullinger Bound*, mainly an attack on the younger poets of the economic school, the other noteworthy volumes were mainly the work of writers just coming into recognition. These included Ben Belitt's *The Five-Fold Mesh*, August Derleth's *Hawk on the Wind*, and Frederick Prokosch's *The Carnival*, all lyric in tone, together with Robert Francis's *Valhalla and Other Poems* and Victor Starbuck's *Saul, King of Israel*, the first principally narrative, and the second a remarkable reconstruction of Biblical drama.

An autobiography of the greatest interest to lovers of poetry and of permanent value as a literary record was Harriet Monroe's *A Poet's Life: Seventy Years in a Changing World*, which told the story of the magazine "Poetry" from its inception to Miss Monroe's death. Eunice Tietjens's *The World at my Shoulder* served as a supplement to Miss Monroe's recollections because of its author's long association with the same magazine George F. Whicher's *This was a Poet*, a sane and scholarly biography and critical study of Emily Dickinson, was another important contribution to the poetry shelf.

Miscellaneous. In addition to Margaret Halsey's *With Malice Toward Some*, the books of a varied character that attracted the most attention included Anne Lindbergh's *Listen! The Wind*, Rear-Admiral Richard E. Byrd's *Alone*; Commander Edward Ellsberg's *Hell on Ice: The Saga of the Jeanette*, all in the field of adventure, and Dr. Arthur E Hertzler's *The Horse and Buggy Doctor*, a salty account of a country physician's life and philosophy. Mrs. Lindbergh wrote of air pioneering with beauty and distinction, Admiral Byrd told the dramatic story of his two months alone in the Antarctic, and Commander Ellsberg revived one of the heroic tales of early American Arctic exploration.

Other noteworthy publications were *The Evolution of Physics* by Albert Einstein and his co-worker, Leopold Infield; Lewis Mumford's *The Culture of Cities*, a detailed study of urban life pointing towards a solution of contemporary problems; *American Regionalism: A Cultural Historical Approach to National Integration*, an extension of Dr. Odum's regionalistic theories first applied to the southern United States; and Josephus Daniels' *A Southerner Discovers the South*, an attempt by a journalist and novelist to see the contemporary South clearly and to state its pressing social and economic problems. (H. Bl.)

ANÆMIA. In 1938, bone marrow studies (sternal puncture) have become a standard aid in the diagnosis of the type of anæmia. Red blood cell size has assumed primary importance in diagnosis, classification of anæmia, and treatment. "Tagged" (radio-activated) iron and phosphorus have been used in the study of metabolism of these substances in anæmia and leukemia. Hæmolysins have been demonstrated in the blood and in splenic extracts in hæmolytic anæmia. Additional studies on hæmopoietin, the gastric secretion which generates the precursor of liver extract, suggest that it is a proteolytic enzyme. Deficiency of this "intrinsic factor of Castle" may account for the macrocytic anæmia in some patients with gastric carcinoma. A hypoplastic anæmia is reported as characteristic of latent benzol poisoning.

A sterol extract of liver, shortening the coagulation time of blood, has been isolated. The use of moccasin snake venom has been extended in the treatment of bleeding due to capillary fragility, and fer-de-lance and similar venoms are used for local hæmostasis. Vitamin K is being tested as a hæmostatic in patients with jaundice.

The use of "blood banks", placental blood and cadaver blood for transfusions has received widespread application. Yeast and its derivatives have received extensive trial in the treatment of anæmia. Mucin, in large amounts, may

inhibit the intestinal absorption of iron in chronic hypochromic (iron deficiency) anæmia Ferrous iron has been found to produce maximal effects in relieving the anæmia in children, in doses smaller than required with ferric iron, without the use of copper.

ANÆSTHETICS. Activity in the study of anæsthetics during the past year has been greater apparently on the scientific and experimental side than in purely clinical investigation. The actual administration has, in expert hands, now left little room for improvement, whether as regards the safety of the patient or as regards his comfort at the time and afterwards. Nevertheless, there is still a definite post-operative mortality for which anæsthetics are probably in part, if not chiefly, to blame. It is natural therefore that research should be directed to trying to discover the exact way in which anæsthetics act in the blood and on the tissues of the body. Such research may elucidate the unexplained fatalities, and such research can only be undertaken by laboratory workers, though best in close association with the practising anæsthetist. On such lines the barbituric compounds which now provide so many widely used anæsthetics—nembutal, evipan, pentothal, etc —have been the subject of much investigation. The blood content of barbiturates at different stages of narcosis has been inquired into and a rapid method of estimation evolved which enables speedy and sometimes life-saving intervention to be made. Also a number of animal experiments have been carried out to ascertain the part which various factors may play in enhancing the danger of barbituric poisoning; for it is known that in some instances, for reasons which are not yet clear, these drugs exert injurious if not fatal influences on the function of the liver. These researches appear to establish the fact that, at any rate in certain animals, cold, sepsis, fasting, bleeding, and certain operations can convert the action of an otherwise safe dose of barbiturate into one which greatly prolongs the narcosis, or in extreme instances leads to a fatal result.

A new barbituric compound, pentothal acid, has been introduced after three years' clinical and laboratory research. It is designed for use as a basal anæsthetic, and has the advantages that it can be given satisfactorily by the mouth and is more free than other barbiturates from the restlessness that is apt to follow narcosis due to these compounds. Another recently introduced compound, sodium thioethamyl, gives results indistinguishable from those of the well-established pentothal sodium.

A gas which has recently been employed in the service of anæsthetics is helium, the lightest known gas after hydrogen. Helium is not an anæsthetic, but by its low density it enables gaseous anæsthetics with which it is mixed to be breathed through constricted apertures in greater volume and with less effort on the patient's part than can the anæsthetic alone. Thus helium can be of great emergency value in patients who are suffering from some mechanical respiratory obstruction and require the administration of an anæsthetic. It is maintained also that the presence of an inert gas, helium, which is but slowly removed from the alveoli of the lung, can play an important part in preventing that collapse of the lung which is so formidable an effect in a certain proportion of instances after administration of cyclopropane and oxygen.

The search for drugs to combat shock, a problem often confronting the anæsthetist, has recently brought into being a synthetic amine isomeric with ephedrine. The value of the latter in circulatory collapse is well proven. The new product B- (p- oxyphenyl)—isopropylmethylamine is marketed as Veritol, and has an action similar to adrenaline in its low toxicity and to ephedrine in its long-continued effect and activity after oral administration. It should prove highly valuable. (J. Bd.)

ANCIENT MONUMENTS. The number of monuments in Great Britain cared for by the Office of Works increased rapidly, and over 5,000, prehistoric to recent, are now under its charge. The restoration of The Hurlers, Cornwall, continued under Mr. Ralegh Radford, four more stones being found, which will be re-erected in their original positions. Excavations at Richborough Castle, Kent, revealed defensive works of A D. 43 and the subsequent use of the site for military stores. The London and North-Eastern Railway presented to the nation a piece of land in connexion with the excavations at Milecastle, Hadrian's Wall, so that the whole of Milecastle can be excavated: work is to begin in the spring. Marlborough House Chapel, the old "Queen's Chapel" of St. James's Palace, was readorned and restored during the year; Queen Mary attending the first service after the reopening, and having presented to her officials of the Office of Works who contributed to the readornment. At an exhibition at the Institute of Archæology of the University of London, held in May, the Office of Works showed pieces of mediæval carving from Thetford Priory, Norfolk.

At Clarendon Palace, near Salisbury, a thirteenth-century tile-kiln was discovered. It is the first mediæval kiln discovered not connected with a monastery. Probably the tiles used at Clarendon Palace were made on the spot. At Gainsborough, Lincs, the historic hall is to be preserved for the nation and adjacent land kept free of buildings. The London County Council marked with a plaque the house in Southampton Street, Pentonville, where Joseph Grimaldi, the famous clown, died in 1837. Other items of interest include the handing over by Lord Yarborough of Thornton Abbey, Lincs, to the Office of Works and the presentation to the nation of Kenilworth Castle by Lord

O. Salomon]
CLARENDON PALACE EXCAVATIONS, SHOWING STAIRS TO THE GREAT HALL AND THE KING'S KITCHEN IN FOREGROUND

Kenilworth; work has begun on the keep and other parts.

In Wales, preservation of the Roman town wall at Caerwent restarted and the courtyard of St. David's Bishop's Palace was cleared. Raglan Castle and a megalithic monument "Tinkinswood Burial Chamber" were placed in charge of the Office of Works.

In Scotland, Office of Works excavations continued in Orkney and prehistoric settlements were discovered at Jarlshof, Shetland. Work continued on several abbeys and at Moray and St Andrews Cathedrals. At Culross Palace, work was finished

Mr. Reginald Frances Joseph Fairlie was appointed a member of the Royal Commission on Ancient and Historical Monuments (Scotland), in succession to the late Dr. J. Graham Callander. (V. R.)

See *Regional Guide to Ancient Monuments, South Wales.*

ANDAMAN AND NICOBAR ISLANDS. These form a long series of summits of a submarine mountain range in the eastern part of the Bay of Bengal. Area 3,143 sq. miles; population 29,463. The natives are primitive Animist tribes, and cultivation among the forest-clad hills is sparse. Mr. C. F. Waterfall is Chief Commissioner for the islands. Transportation being no longer a judicial penalty in India, the penal settlement at Port Blair will gradually disappear. The chief exports of the islands are a variety of valuable timbers from Andaman and coco-nuts from Nicobar. (ME.)

ANDORRA. A republic in the eastern Pyrenees under the joint suzerainty of France and the Bishop of Urgel. Its chief products are oats, barley, vines, tobacco, sheep, iron and lead. A good road provides a link with Spain.

Area. 191 sq miles.
Population. 5,230.
Capital Town. Andorra la Vieja.
Language. Catalan.
Religion. Christian (Roman Catholic).
Imports from United Kingdom: in (1936) £1,000; (1937) £63.
Currency. French and Spanish legal tender.

ANGLICAN COMMUNION, THE. The year 1938 will long remain memorable in ecclesiastical annals as Bible Year and as the year of the publication of the Doctrinal Report. Both matters were of world-wide interest and of an importance even transcending the Anglican Communion, but the Doctrinal Report is the subject of a separate article, Archbishops' Commission (Doctrinal Report) (*q.v.*). (*See* also CHURCH OF ENGLAND, THE.)

400th Anniversary of the Open Bible. Throughout the Anglican Communion the year was observed as Bible Year in commemoration of the Royal Injunctions issued in 1538, through the Vicar-General, to all parochial clergy that they should each "provide one book of the whole Bible of the largest volume in English and the same set up in some convenient place within the said church that you have cure of, whereas your parishioners may most commodiously resort to the same and read it." These Injunctions ushered in what the *Manchester Guardian* described as "a new England." The whole of 1938 was Bible Year in memory of their results, but the special celebrations culminated on June 17 in a great National Service of Thanksgiving for the English Bible held in St. Paul's Cathedral. The Free Churches took part in the service, and the lessons were read by the Speaker of the House of Commons (Capt. E. A. FitzRoy) and the Lord President of the Council (Viscount Hailsham). It was perhaps not unfitting that in this year the Annual Report of the British and Foreign Bible Society should record the issue of a portion of the Scriptures in the 1,000th language (Sakata) into which they have been translated.

World Councils and Conferences. The Anglican Communion continued to take an active part in various world councils and conferences of the Churches. As a result of the Oxford and Edinburgh Conferences of 1937 plans were submitted to the Churches by a Conference of Churches, which met at Utrecht in May 1938, for a World Council of Churches to carry on the work of the two œcumenical movements "Faith and Order" and "Life and Work", and for other purposes which may be broadly summarized as the fostering of "œcumenical consciousness" and co-ordination with such movements as the World's Alliance of Young Men's Christian Associations, the World's Student Christian Federation, and the International Missionary Council. A constitution was approved and a provisional committee was set up under the chairmanship of the archbishop of York to carry out the recommendations. Most of the Provinces of the Anglican Communion were represented at a meeting of the International Missionary Council held in the late autumn at Tambaram, Madras.

Losses by Death. Among the losses through death, mention must first be made of the Most Rev. C. F. D'Arcy, archbishop of Armagh and Primate of All Ireland, perhaps the most outstanding Christian thinker of his day on the philosophical relations of science and religion. Other losses included Dr. D'Arcy's successor, the Most Rev. J. G. F. Day; the Most Rev. F. R Phelps, archbishop of Capetown; the great ecclesiastical lawyer, Sir Lewis T. Dibdin; and among theologians, Canon B. H. Streeter, Provost of Queen's College, Oxford, and the Right Rev. W. H. Frere, sometime bishop of Truro.

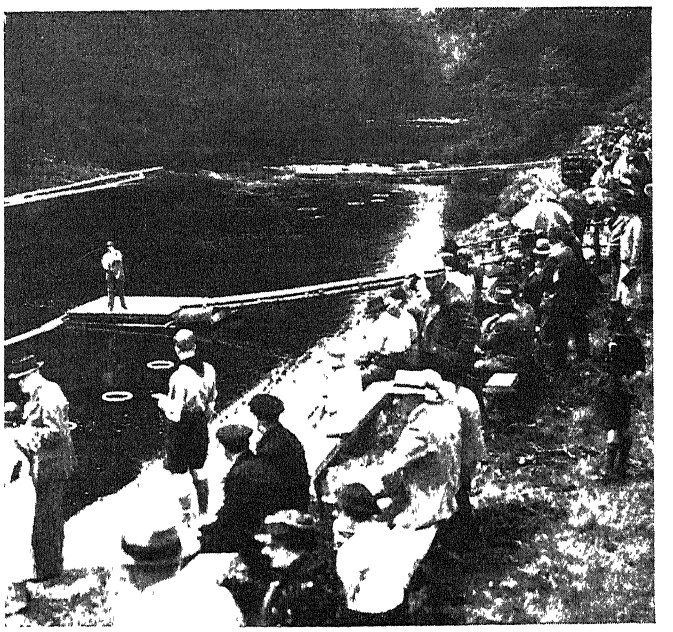
India. In the Church of India, Burma, and Ceylon, "mass movements" of conversion continued and progress was made in the creation of new dioceses. The revised scheme for Church union in South India was referred to the Central Consultative Body of the Lambeth Conference, which expressed the opinion that "except in regard to the new position of the bishops in the Synod, with reference to matters of Faith and Order, the changes introduced since 1930 are not such as to give ground for supposing that the Lambeth Conference of 1940 would wish to reconsider the general approval given in 1930."

Other Events. For the rest, it must suffice to record an increase of $1,450,822 in the 1937 contributions, published in 1938, to the Protestant Episcopal Church in the United States of America; considerable missionary activity on the part of the Irish, Australian, New Zealand, and South African Provinces; the dedication of a new cathedral in Cairo and of the American memorial to King George V in Winchester Cathedral; new hopes of greater unity in the scattered Province of the West Indies; and the resumption of Empire migration under the Church of England Advisory Council of Empire Settlement. In connexion with the last of these every member of the first large party to sail for New South Wales received a warm personal message of encouragement from Queen Mary. Finally, all Provinces and jurisdictions of the Anglican Communion responded to the Call to Prayer issued by the archbishop of Canterbury in the international crisis of Sept. 1938. (R. S.)

United States. The year 1938 has seen no important changes or events in the sphere of administration or of organization in the Protestant Episcopal Church, the American branch of the Anglican Communion, but it has brought deep experiences in the spiritual sphere.

Among the chief activities were the continuance of the

Forward Movement for the spiritual strengthening of the Church; the participation of the Episcopal Church in movements looking towards Christian Unity, without compromise of those principles of Faith and Order which are essential to the life of the Church, and continued effort to maintain the Church's missionary work in spite of financial stress at home and the tragic effects of war in some of the missionary fields abroad



The continued financial depression made the year 1938 an exceedingly difficult one, perhaps the most difficult yet, for the raising of funds for religious, social, and charitable purposes. The statistics show, however, some increase in contributions, and they show also an increase over the preceding year in the number of persons confirmed, and in the total membership of the Church. The records show a total number of 2,110,473 baptized persons, of which number 1,439,968 are communicants.

But the outstanding matter in 1938 was the spiritual stirring of the Church by conditions in this world, and by events and acts such as few would have believed to be possible. The efforts of some governments to destroy religion and to abolish human freedom, the reversion in some countries to barbarism and to almost incredible racial and religious persecution, have challenged the faith of Christians everywhere, and to the poignancy of this situation has been added the imminent threat of world war. That appalling possibility—by no means yet removed—brought men and women to their knees in prayer, and awakened in many a realization of their spiritual need. In the Episcopal Church this stirring of the Spirit has been observable in a deepened note of spiritual earnestness, in a call for fuller faith in Christ and for greater faithfulness to Him, and in a greater readiness to seek the spiritual helps and means of grace which the Church offers. In many places church attendance has shown definite increase. No one can say how great the effects of this spiritual awakening may be, but one of its evidences is a strong Youth Movement, now widely in progress, which is making its own vital and indispensable contribution to the life of the Church. (W. T. M.)

ANGLING. Anglers in Great Britain enjoyed a better season in 1938 than in 1937; there is an increase of over 8,000 in the membership of the National Federation, while the Trent and Severn Fishery Boards alone issue over 173,000 rod licences. The Diseases of Fish Act and Public Health (Drainage of Trade Premises) Act, the latter of which came into force in July, have helped angling by encouraging purer conditions in waterways in industrial areas.

The 29th annual All England championship was won in the Bedfordshire Ouse by Hull and District, who, with 38 lb. 12 oz. 7 dr., led last year's winners (Grove and Whitnall) by 12 oz. 2 dr. only; the largest individual catch was G. Bright's (Bristol and West of England) 21 lb. 13 oz. 8 dr. A world record sea-trout (29 lb. 2 oz.) was caught on the fly in the Em, Sweden, in September, and in the same month, a record roach (3 lb. 14 oz.) in a M.W.B. reservoir at Molesey; trout anglers had a record season on Loch Leven, 57,884 trout (46,723 lb.) being taken as compared with 22,786 in 1937. It is of interest to note that trout from Scottish and West of England rivers have been successfully introduced into the tropical rivers of the Malay States, only 400 miles from the Equator.

Salt-water angling was well up to standard and many notable fish were recorded. Off Scarborough Capt. C. H. Frisby, V.C., broke all records for a day's catch of tunny with five fish totalling 2,812 lb. (about 1¼ tons), beating

Sport & General]
THE USK VALLEY CASTING TOURNAMENT AT GLANUSK PARK, CRICKHOWELL, BRECONSHIRE, SOUTH WALES

the previous best one-day catch by approximately ¾ ton, and among other notable captures were: 13½-lb. bass at Coverack; john dory of 8 lb. 1 oz. (Mount's Bay); thresher shark of 120 lb. (Boscombe); 32-lb. cod (Ballycotton); and a plaice of 6 lb. off Gairloch. A record pollack of 22 lb. was taken in a net off Coverack, and a 40-lb. conger hooked off Budleigh Salterton. The best day's catch of general fish was made off Ballycotton by K. Fuller and L. Buttriss and scaled 642 lb. Tope fishing did not reach the level of 1937, though several tope of over 40 lb. were recorded.

America. The following world's records in salt-water fishing were made: a 215-lb. sailfish was caught on Sept. 20 off Acapulco by Albert B. Pullen, of Mexico City; a 161-lb. white marlin was caught off Miami on March 21; and on Sept. 4 a blue-fin tunny, weighing 864 lb., was landed by F. Alfred Kenney, near Jordan Bay, Nova Scotia.

In the international tunny matches held in August at Liverpool, Nova Scotia, Cuba was first with 5½ points, followed by U.S.A. 3 points, and Great Britain, the former champions, with half a point. The all-round championship in the international casting matches held in Paris was won by Marvin Hedge, of Portland, Oregon.

ANGLO-EGYPTIAN SUDAN. Compared with the preceding year 1938 was relatively uneventful. The reorganization of the provincial administration, which started to come into force in 1937, was continued and has proved an undoubted success. Public security was also undisturbed throughout the country.

In the course of the discussions between the Egyptian prime minister, Mohamed Mahmud Pasha, and the Foreign Office in London during the summer, the question of the Egyptian subvention of £Eg.750,000 to the Sudan was raised, and as a result of subsequent conversations between the Financial Secretary of the Sudan government and the Egyptian ministry of finance it was agreed that the amount should be reduced to £Eg.500,000 for 1938, that in 1939 it should be only £Eg.250,000, and that thenceforward it should be abolished altogether.

A permanent exhibition of Egyptian products has been established in Khartoum as a result of the visit of Egyptian economic and commercial exports, and in Egypt a perma-

State Service. The change over has proceeded practically without a hitch and the practising members of the veterinary profession are working loyally with their government colleagues towards the end in view

Tuberculosis of cattle has been the first disease to be added to the schedule, but statistics are being steadily compiled in regard to others, especially contagious abortion, Johne's disease, and mastitis. These diseases, whose losses by the aftermath of damage which they cause to farm stock cost the breeder and dairyman many millions of pounds a year, will inevitably come forward as soon as the favourable opportunity arises.

Notwithstanding the fact that 1938 has been a troublesome and very anxious year, Great Britain is still the envy of the world in regard to the success with which the veterinary department keeps control over foot and mouth disease; and the fact that during 1937 two dogs developed rabies whilst, providentially, detained in quarantine, is practical evidence of the wisdom of the law which compels owners who wish to import dogs and cats to hand them over to government quarantine kennels for a minimum period of six months

The continued absence of glanders from the horses of our country may also be quoted as a triumph of veterinary scientific control.

In the *Report of Proceedings under the Diseases of Animals Act* for the year 1937, issued by the Ministry of Agriculture and Fisheries, it is stated that there are in Great Britain 1,004,686 horses, 7,909,126 cattle, 24,712,054 sheep, 3,882,591 pigs, and 2,932,612 dogs.

Amongst these, of the specialized diseases which have to be compulsorily reported the official numbers of outbreaks reported are as follows:

Anthrax, 743, involving 879 animals, of which 820 were cattle.

Foot and Mouth Disease, 187 outbreaks, involving the slaughter of 9,326 cattle, 15,455 sheep, 6,795 pigs and 10 goats; for which the owner received fair compensation.

Parasitic Mange, 115 outbreaks, all in horses, of which some 179 animals were infected.

Sheep Scab, 253 outbreaks; and *Swine Fever*, 982 outbreaks, for assistance in the diagnosis of which some 584 pigs were slaughtered.

Of the above diseases the numbers of outbreaks of Anthrax and Foot and Mouth exceeded those of each of the previous four years, whilst the statistics of parasitic mange, sheep scab, and swine fever showed very gratifying diminutions.

No outbreaks of cattle plague have been reported since 1877; of epizootic lymphagitis since 1906; of glanders (including farcy) since 1928; of pleuro-pneumonia since 1898; of rabies since 1922; of sheep-pox since 1850. No case of fowl pest has been confirmed in Great Britain since Jan. 11, 1937, the date from which the disease was first notifiable. No case of fowl pest has been known to exist in Great Britain since 1933. These facts are all tributes to the effectiveness of the advice given by the Veterinary Service of the Ministry of Agriculture and the thorough manner in which the instructions are carried out by the lay staff and the police authorities.

The subject of poultry diseases must not be forgotten, for those which are preventable have been publicly stated, as already mentioned, to cost the poultry owners no less than four million pounds annually; and one has only to read any poultry paper to realize the terrible plight to which the poultry industry has been reduced—mostly through neglect of disease at its onset in the past. Poultry diseases are at last receiving government attention, and the Ministry's laboratory and research station at Weybridge has recently had numerous additions to its buildings and its staff for this special research. (F T. G H)

ANNAM: *see* FRENCH INDO-CHINA.

ANTHROPOLOGY. During 1938 the destinies of Anthropology became inextricably bound up with the rapid course of historical events. Some political systems, which have established an exclusive monopoly in the control of views and principles, have also adopted clear-cut anthropological doctrines: the supremacy of the "Aryan" or "Nordic" race, the founding of nationalism in the realization of "blood and soil", the conception of culture as being indefinitely plastic and capable of direction by centralized control.

The German occupation of Austria has thus led to a change in the personnel of the Department of Anthropology at Vienna, and to the uprooting of psychoanalytic research in ethnological problems. The publication of such journals as *Anthropos* and *Imago* will no doubt continue, but from some other centre. The spread of German influence bids fair to introduce into various countries of Central and Eastern Europe the specific points of view on race and nationality held by National Socialism. It can be noted already in international gatherings that the German language is becoming more and more extensively adopted at the expense of English and French. Recently also the Italian regime has been trying to impose the anti-Semitic outlook on its subjects and a number of savants have provided an "anthropological philosophy" to support this movement.

The military invasion of China by the Japanese must also influence anthropological studies, especially those of a cultural and sociological nature. Anthropological work in China, led by such scholars as Weidenreich, Shirokogorov, Wu Wen-tsao, and R. Fortune will, it is hoped, continue in spite of the new difficulties. In Japan the influence of German anthropological doctrines is on the up-grade, and the German language is being used more and more in books and journals.

Russia is adopting, especially as regards cultural anthropology, an attitude of non-co-operation. Thus there was no response to the various private and official invitations to participate in the International Congress at Copenhagen.

The International Congress of Anthropological and Ethnological Sciences held its second session in Copenhagen during 1938. The large attendance, the scope and value of the contributions, and the liveliness of the discussions at this Congress manifested its vitality and its interest in the study of Man. Thirty-eight countries were represented, subscriptions were well over 700, and most subscribers were in personal attendance. Nevertheless, a somewhat antiquated perspective was introduced into the work of the Congress by the lumping into one section each of Social Anthropology and Religion, and of European Ethnology and Prehistory; the lack of special sections for field-work and theory; and the omission of such differential studies as primitive jurisprudence, economics, education, as well as of applied anthropology.

Professor A. W. Brögger, of Oslo, expressed the general feeling at the inaugural session when he pointed out that, living in the savagery of modern civilization, the European might learn a good deal from the study of the civilizations of "savages".

In the session on Race, H. J. Fleure, Rolf Nordenstreng, and B. Škerlj discussed the concept of human race, showing

how difficult its definition is even from the anatomical and biological point of view, not to speak of attributing to race any cultural or psychological values

Professor E. Fischer, in a paper on race and the inheritance of spiritual characteristics, attempted to introduce some principle of gradation or evaluation of racial features. In the discussion following, Professor M. Herskovits maintained that it is not possible scientifically to measure or even to assess values and characters as regards race.

Among the joint sessions, the lecture of Dr Sylvanus G. Morley, " A Review of Twenty-Five Years' Research in the Maya Area of Middle America by the Carnegie Institution of Washington " ; a public address by the great physicist, Dr Niels Bohr, on " The Relations between Rational Philosophy and Humanistic Studies " ; and films from Greenland interpreted by the Administrator of that country, J. Daugaard-Jensen, attracted general interest and contributed to the advancement of knowledge.

The Eighth Volta Meeting, organized by the Royal Academy of Italy, with an international attendance of invited guests, was held at Rome in October. The subject was Africa, considered from the point of view of many disciplines. Among the anthropological contributions may be mentioned those by Sir Claude Hollis on the Masai, Pater W. Schmidt on the Galla, J. Czekanowski on the racial strains among African populations, and of R. Thurnwald and B. Malinowski on culture contact and change. An interesting linguistic contribution was made by M M. Moreno on the contact of vernaculars and the literary languages of new indigenous Africa. G. Danielli read a paper on environment and culture in Africa ; J. Carcopino on the cultural achievements of the Berbers in historical perspective ; and M. Guidi on Islam and Christianity in relation to indigenous religions and cultures. Sig. Alessandro Lessona and Prince Leon Sapieha discussed the need for European solidarity in Africa, while Mr. Tracy Phillips pointed out the dangers, for the future of the colonizing Powers, of not considering indigenous interests. *See Proceedings of the Eighth Volta Congress* (1938).

Third International Congress of Phonetic Science. This was held at Ghent, and was attended by over 280 members. A special session on anthropological linguistics was held, in which Miss I. C. Ward, Professor D. Westermann, Professor I. van Ginneken, Dr. R. Stopa, and Dr. P. de V. Pienaar took part. A special discussion was devoted to the subject of clicks, on which Dr. R. Stopa is one of the world experts The main event of the Congress was the foundation of an International Society of Phonetic Science, with Professor Daniel Jones of London as first president.

Lord Hailey's African Survey. To the anthropologist this survey—which is international in character, for it refers to French, Belgian, Italian, Portuguese, as well as British colonies—will be of special interest, because the science of Man occupies in it a dominant place. Of the twenty-five chapters in the book, some sixteen would have been impossible without the African ethnographic field-work on which they are largely based.

Lord Hailey throughout recognizes that research in natural or physical sciences is insufficient without the anthropological or sociological approach. The author is equally clear and precise in recognizing that to keep apart " pure " and " practical " research is as futile as it is meaningless. He tells us that " it has more than once happened in Africa itself, that a study which appeared entirely theoretical has unexpectedly revealed facts of immediate and very practical use ". In no other science is this principle as necessary as in anthropology, where again and again advocates of academic detachment and of " pure scientific attitudes " still try to combat the development of applied or practical anthropology.

The International Institute of African Languages and Cultures has been for the past ten years stimulating and sponsoring work in practical or applied, as well as theoretical, anthropology, and linguistics. It has to its credit the production of a team of experts in field-work and theory : Professor I Schapera of Capetown ; Dr. A. I. Richards, Lecturer at Johannesburg ; Mr. Godfrey Wilson, Director of the Rhodes-Livingstone Institute in Northern Rhodesia ; Mrs. Godfrey Wilson (Monica Hunter), whose book *Reaction to Conquest* is a standard work in culture contact ; Dr. Kalervo Oberg, with field-work among the Banyankole ; Dr. S. F. Nadel, who worked among the Nupe in northern Nigeria, and is now engaged in field-work among the Nuba in the Southern Sudan ; Dr. M. Fortes, with field-work among the Tale, now Lecturer at the London School of Economics ; Dr. Günther Wagner, with field-work among the Kavirondo ; Dr. Margaret Read, Lecturer at the London School of Economics, with field-work in Nyasaland ; and many others.

The Institute organized in 1938 a co-operative expedition for the study of nutritive problems in Nyasaland. The work is carried out by medical, nutritive, anthropological, and agricultural experts and government officers. Dr. Margaret Read has been sent out by the Institute to carry out the anthropological investigations, and Dr. B. S. C. Platt is in charge of the medical and nutritive research. The Institute had, some time ago, convened a special committee on nutritive research under the initiative of A. I. Richards and R. W. Firth. Memorandum XV, " Notes on the Study of Culture Contact in Africa ", contains seven articles, written, with one exception (Mr. and Mrs. Culwick), by former Fellows or Associates of the Institute (L. P. Mair, M. Hunter, I. Schapera, A. I. Richards, M. Fortes, and G. Wagner). In this memorandum some of the most important methodological and practical results of the field-work carried on in Africa under the auspices of the Institute are to be found.

The 1938 volume of *Africa*, the journal of the Institute, presents a new feature, the publication of supplements, which contained two important memoirs. Dr. M. Read writes on " Native Standards of Living and African Culture Change ". This is an analysis of one of the most important issues in culture change. It contains first-hand information on the new economic developments among the Ngoni, as well as an account of their old tribal economy. It contains a number of theoretical discussions and defines such concepts as " standard of living ", " economic improvement ", and " value ", most of which need redefinition in terms of field-work. The other supplement, written by M. Fortes on " The Social and Psychological Aspect of Education in Tale Land ", is an all-round study of training, growth, and development in a West African community.

Physical Anthropology and Human Prehistory. In these subjects research has in recent years been carried out on an international basis. In 1936 Weidenreich reported three new crania associated with *Sinanthropus* at Choukoutien near Peking, generally sinanthropoid in character, but with the Neanderthal type foreshadowed in them. From this, and from earlier and additional finds, Weidenreich concludes that *Sinanthropus* as a type was so variable as to represent a continuous line from a very primitive to a rather advanced human stage of development. (*Cf.* Weiden-

reich's papers published in *Paleontologica Sinica*, 1937–38) The findings and investigations in Java have been the subject of important studies by de Terra and von Konigswald, in which the geology of Java has been outlined and its relation to the Asiatic mainland clarified. In 1938 the third skull assigned to *Pithecanthropus* was found in Java, differing from the first two in that certain cranial characters show an approach towards *Sinanthropus*. Important discoveries of the last years by von Oppenoorth in the Ngandong zone (1932), by Kohl-Larsen at Lake Eyassi in East Africa in 1935, and by Broom in South Africa have led to the assumption of a form termed *Paranthropus robustus*. On the basis of this new material Broom assigns Taungs to Lower Pleistocene, Kromdrai to Middle, Sterkfontein to Upper. All these forms, plus Man, asserts Broom, arose from an African Pliocene form about 3,000,000 years ago.

In a preliminary report, Sir Arthur Keith and McCown recently described the skeletal remains from Mugharet es-Skhul and el-Tabun, referable to Levalloiso-Mousterian horizons.

In North America the problem of the " Folsom Complex " has been considered by Roberts, Howard, Antevs, McClintock, Shetrone, Bryan, and Harrington among others. In general it is agreed that the Folsom material dates to the pluvial period immediately following the retreat of the last glacier.

Complementing Kapper's résumé of the proto-historic and recent anthropology of the Near East, Krogman has reported on the crania excavated by the Oriental Institute at Alishar Hüyük, Anatolia, dating from before 3,000 B C. to the eighteenth century A.D. (*O. I. Publications*, vol xxx, pt. III, 1937).

An increasingly important phase of physical anthropology is the study of human growth. The anthropometry of growth is being supplemented by a study of maturation as revealed by the X-ray. A milestone in this newer approach is Todd's atlas of skeletal maturation in the hand (1937). The study of the adolescent child has been greatly facilitated by two recent monographs issued by the Society for Research in Child Development. The first is a *Handbook* by Greulich, Day, Lachman, Wolfe, and Shuttleworth ; the second an *Atlas* by Shuttleworth.

Professor E. A. Hooton of Harvard has published a new book, *Apes, Men, and Morons* (1938), following up his well-known work *Up from the Ape*. Written in a clear, incisive, and eminently readable style, both volumes are not merely excellent surveys of the present state of general anthropology for the lay reader, but constitute a real contribution towards the science of race and culture.

The study of cultural anthropology might better be discussed under the separate headings of the various countries.

Australia. The work is carried out mostly from the Department of Anthropology in the University of Sydney. A survey of this will be found in an article by A. P. Elkin, entitled " Anthropological Research in Australia and the Western Pacific, 1927–1937 ", in *Oceania*, vol. lxxx, 1937–38. M. F. Ashley-Montague contributes three important articles on subjects lying on the borderline between biological and cultural anthropology : " The Future of Australian Aborigines " ; " The Origin of Subincision in Australia " ; and an analysis of the " Infertility of the Unmarried in Primitive Societies ". In this last is given an explanation in biological terms of one of the most puzzling phenomena in general ethnology.

Belgium. Scientific work here largely centres around the Museum of the Belgian Congo at Tervuren, the Royal Colonial Institute, and the Royal Museum of Art and History The annual bibliography published by the Museum (*Bibliographie du Congo-Belge et des Régions Avoisinantes*) presents a useful picture of the numerous publications in anthropology, administrative studies, and other disciplines referring to the region. Professor Smets has returned from his expedition to Ruanda and Urundi and is publishing his materials. Professor F Olbrechts of Ghent is back from his recent field trip to Senegal, Sudan, and the Ivory Coast.

China. Work in this country has suffered from the vicissitudes of war. Some of the results, however, of field-work organized by Professor Wu Wen-tsao have already been published, notably a remarkable monograph by Dr. Fei Hsiao-tung, *Peasant Life in China* (1938), which contains a well-rounded description of family life, economic pursuits, and trade in a village community.

France. An event of the first magnitude for ethnographic development was the inauguration on June 20 of the *Musée de l'Homme* by the President of the Republic. It is the only great institution of its kind devoted exclusively to ethnographic collections, but embracing also most of the libraries, teaching institutions, and learned societies of the French capital. In this new museum, which was built on the site of the old Trocadero, the French Institute of Ethnology is already housed, and most of the teaching in the subject will be carried out there The old Museum of Physical Anthropology has moved from its old location at the *Jardin des Plantes* with all its collections and books.

In the other wing of the new Trocadero, the sister museum of French folklore (*Musée National des Arts et Traditions Populaires*) is now being organized, and it is expected that its inauguration will take place in June 1939. This museum will contain, on the one hand, the creations of French artistic genius in historical perspective, and on the other, exhibits of folk implements, constructions, and houses.

The credit for the total achievement must primarily be given to the energy and organizing talent of Dr. Paul Rivet. The *Musée de l'Homme* is now under the direction of J. Soustelle ; and the folklore museum is being developed by Georges Henri Rivière and André Varagnac, who were primarily responsible for the organization of the First International Congress of Folklore, held in Paris in the summer of 1937, the proceedings of which have now been published as *Travaux du Ier Congrès International du Folklore*. M. Van Gennep is publishing a year-book (*Manuel de Folklore Français contemporain*), of which two volumes (Nos. 3 and 4) have already appeared.

M. André Varagnac is the organizer and leader in an important enterprise : *Les Journées de Synthèse Historique*, in which the fundamental problems of humanistic science are being discussed on an international basis and with reference to various social sciences, including ethnology, folklore, and linguistics. The French work on folklore is now carried on in close collaboration with students of other countries, notably of Scandinavia. M Rivière and M. Varagnac are members of the editorial committee of *Folk-Liv*.

Of the important books which appeared in 1938 as publications of the Institute of Ethnology, we might mention the following : Marcel Griaule, *Masques et Jeux Dogons* ; Ferghali, *Proverbes syro-libanais* ; Mgr. Grebaut, *Catalogue des manuscrits éthiopiens de la collection Griaule* ; le R. P. Dubois, *Ethnographie des Bétsiléo* (Madagascar) ; Kurt Sachs, *Les instruments de musique de Madagascar*.

Germany. It is not yet known who will be the teachers

appointed to the Anthropology Department of the University of Vienna in place of Fathers W. Schmidt, P. W. Koppers, and P. Schebesta. Professor Muhlmann has moved from Hamburg to the University of Berlin Important contributions will be found in the 1938 issue of the *Zeitschrift fur Ethnologie*, the *Archiv fur Anthropologie*, the *Zeitschrift fur Volkskunde*, and the *Zeitschrift fur Rassenkunde*. Many of the articles contain valuable theoretical re-interpretations of field-work data, a type of work too often neglected in English-speaking countries. A review by W Knickeberg of the *Lehrbuch der Völkerkunde* (ed. K. Th. Preuss) appeared in vol. 69 of the *Z. fur Ethnologie* (1938, pp. 464–6), in which the reviewer points out that the textbook contains articles by a " non-Aryan " writer and that it amounts to a tribute to " an ethnological school . . . of which the Führer (B Malinowski) is a pronounced opponent of the National Socialistic Germany of to-day " (p. 466). The *Lehrbuch* has been withdrawn from circulation and a new edition is soon to appear

Among the publications of the official *Institut zum Studium der Judenfrage*, the monograph on " Die Juden in Deutschland " presents in an " objective " manner the " dangers " of Jewish influence on German culture. The series of articles by W. Milke in Schmoller's Jahrbuch on the various modern theories of anthropology is of outstanding importance.

An event of outstanding importance is the publication of W. E. Mühlmann's *Methodik der Völkerkunde* (1938). This author has previously contributed towards the establishing of a scientific approach to general ethnology. In his book, *Rassen und Völkerkunde*, Dr. Mühlmann discussed the inter-relationship of methods and points of view as between cultural and physical, especially biological, anthropology. His introductory essay in K. Th. Preuss's *Lehrbuch* is again an attempt to reformulate the methods and scope of the science of Man. The new book is a comprehensive survey of method and theory carried out from the functional point of view, but with many new and vital additions. It represents a decisive step forward in the development of cultural anthropology in continuation of the earlier work of Thurnwald and Shirokogorov.

Great Britain. At a summer school for colonial administration at Oxford in July, Lord Lugard gave an opening address and a number of anthropologists discussed problems of culture change, administrative methods, and problems of land tenure, labour, and customary law.

At Cambridge a new post was established, to which Dr. J. Trevor was appointed. Dr. L. Mair is engaged in field work in pure and applied anthropology in Uganda under the auspices of the International Institute of African Languages and Culture. The Royal Anthropological Institute has established a special committee on applied anthropology, which has been analysing problems of native welfare in the colonies. A deputation organized by this committee saw the Secretary for the Dominions (Mr. Malcolm MacDonald), and discussed the problem of consulting native opinion concerning the transfer of Protectorates from Great Britain to the Union of South Africa.

Among the recent books we may mention: *African Dilemma*, by F. Melland and T. Cullen Young (1937); *A Handbook of Tswana Law and Custom*, by I. Schapera (1938); both bearing on practical aspects of anthropology. The volume on the *Religion and Social Organization in Central Polynesia* (1937) (R. W. Williamson and R. Piddington), is a survey of the religious systems of that region with valuable theoretical analyses. The English translation of G. v der Leeuw's important book, *Religion in Essence and Manifestation*, and the appearance in English of G. Landtman's *Origins of Human Inequality*, both published in 1938, have to be noted.

The current issue of the *Journal* of the R.A.I contains the Presidential Address by H. J. Braunholtz on problems connected with museum technique; an article by O. F. Raum on " Some Aspects of Indigenous Education among the Chagga ", a theoretical analysis of original observations; and a memoir by H. I. Hogbin on " Social Reaction to Crime ", in which the problem of a unified reaction of collective consciousness to criminal action is debated on the basis of the writer's own field work.

India. The department of the University of Lucknow, where Dr. D. N Madjumdar is teaching, has planned out a scheme of research in the United Provinces from the linguistic and ethnographic point of view, with due attention given to problems of culture change. Dr. Madjumdar's book, *A Tribe in Transition*, contains an account of original field work on the culture of the Hos of Chota Nagpur. In Calcutta, Dr. K. P. Chattopadhyay is organizing a five-year plan of ethnographical studies on the Santals. The sociological work at the University of Bombay, under the leadership of Dr. G. S. Ghurye, is also concerned with research in cultural anthropology, mostly in regard to the Northern tribes and castes Dr. Chandra Roy, editor of the journal *Man in India*, well known for his studies on the Oraons, has recently published with his son Mr. R C. Roy a volume on *The Kharias* (1937). Field work in social anthropology with special attention to problems of psychology and psychoanalysis has been undertaken by Prince Peter of Greece in the Himalayan Region (1937–38).

Netherlands. The annual conference of Ethnologists in the Netherlands and the meetings of the section for Ethnology of the Flemish scientific congress in Belgium had been in the last few years co-operative. The subjects discussed referred more specifically to studies in Indonesia and Africa.

Of recent books we may mention the five volumes by Dr. Alb. C. Kruyt entitled *De West-Toradja's op Midden Celebes*, published by the Royal Academy of Sciences (Amsterdam) in 1938. An interesting article in the journal *Mensch en Maatschappij* is " Ethnology as a Cultural Science ", by G. W. Locher, in which the contemporary schools and tendencies of anthropology are analysed.

Scandinavia. In the Scandinavian countries anthropological work is partly concentrated on the studies of Arctic cultures, partly on folklore, but also on exotic ethnography. Dr. K. Birkett-Smith continues his publications on the Eskimos, and he has reorganized the Museum in Copenhagen, which was inspected by a large number of visitors during the 1938 International Congress. A new important journal, *Folk-Liv*, was started in 1938 with Professor Sigurd Erixon as main editor. It is the official organ of the Association for European Ethnology and Folk-lore and of the Comité Exécutif de Folk-lore. In this journal the two sides, ethnology and folklore proper, will be conjointly treated, covering the whole of European peasant and popular cultures.

United States of America. The general trend in American anthropology is towards the expansion of interests beyond the American Indians. Thus American anthropology has moved westward largely through its outpost in Honolulu. The department of anthropology at the University of Hawaii and the anthropological section of the Bernice Pauahi Bishop Museum are engaged in extensive research in field work and theory. The studies are primarily concerned with

the ethnographic exploration of the Pacific regions, mainly those of Polynesian and Indonesian stock, while work in Australia, New Guinea, and Melanesia is largely directed from Sydney. Recently a term of field work was undertaken among the Tinguian and allied tribes of the Philippine Islands by Mr. Fred Eggan, of Chicago University, largely with a view to assessing cultural changes which had occurred since the visit of Dr. Fay-Cooper Cole some twenty years ago

American students have also recently done important field work in Africa Thus Professor M J Herskovits published in 1938 a two-volume work, *Dahomey: An Ancient West African Kingdom*, which will rank among the best monographs of African ethnography. In Australia, the work done by Professor Lloyd Warner, D S. Davidson, and L. Sharp has been an important contribution to the ethnography of that continent, as has been the work of M. Mead and Cora Du Bois in Melanesia and Indonesia.

Field work among the Indian tribes of Central and South America by American scholars has, in recent years, been carried out by Dr R H. Lowie in Brazil, J Henry in Gran Chaco, W. Z. Park in Northern Colombia, and by W. Lipkind and B. Quain in Brazil In Mexico and Latin Central America, the pioneering field work of Dr Robert Redfield has been followed by the research of R Linton (of California), Dr. Ruth Bunzel, A. Villa, A. T. Hanson, S. Tax, and C. Wagley.

Another tendency of American anthropology is the widening of scope and methods. The historical method (culture areas, culture centres, the mapping of distributions, the computation of traits, and the reconstruction of sequences) is perhaps still dominant. At the same time, functionalism, the study of cultural patterns, the statistical approach, even a judicious revival of evolutionism, the psychological and psychoanalytical treatment of anthropological material—all these contribute towards the widening of the foundations and diversification of aims in the study of Man.

American archæologists are now engaged in defining past cultural levels as organic and functional units rather than in terms of one trait or even an agglomeration of traits. The technique of tree dating and the use of well-defined ethnographic data in prehistoric research are contributing towards a more exact chronology and fuller cultural analysis.

In linguistics a widening outlook which embraces phonology and semantics as well as methods of recording texts and interpreting them is being elaborated. The new philosophical school of semantics led by Count Korzybski was able to establish an Institute at Chicago to which G. Devereaux is attached for anthropological research. The study of primitive music has been strengthened in America by the appointment of Professor Kurt Sachs to a chair at the University of New York.

The *American Anthropologist* for 1938 contains articles by V. F. Ray and others on " Tribal Distributions in Eastern Oregon and Adjacent Regions ", in continuation of a previous article (1937) on " Great Basin Shoshoneans ", by W. Z. Park and others. These articles show another tendency of recent American work, the attempt to complete the scientific survey of certain lesser-known areas, the Great Basin, North-eastern Woodlands, and the Mackenzie River area.

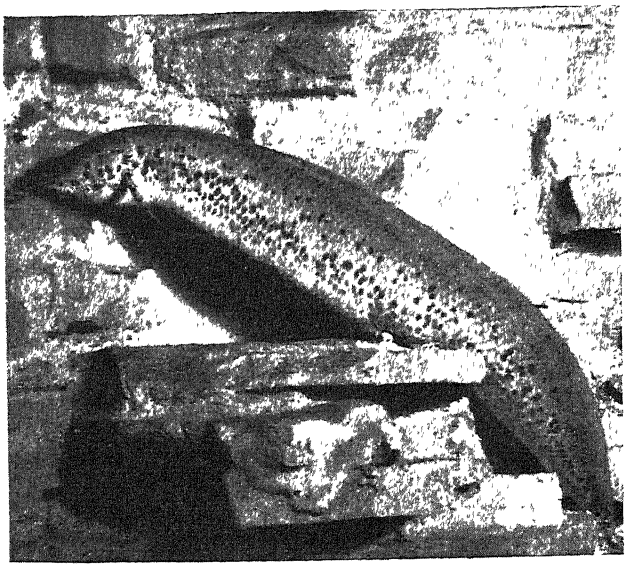
Latin America. A good guide to the detailed study of anthropological events in the Latin Americas is provided by the *Handbook of Latin American Studies* (edited by L. Hanke). It was first published in 1936, and a third volume appeared in 1938. Besides annotated bibliographies, there are provided also general summaries of events, institutionalized work, and teaching. The summaries have been drafted in the previous volumes by A M Tozzer, J A Mason, R. Redfield, R Karsten, and W. Bennett The account by R Karsten, for instance, in the volume for 1937, supplemented by a note by W. Bennett, gives a good idea of what has been happening in South American ethnology for the past few decades. In the 1938 issue a general statement by A Métraux indicates such recent developments as the field work of C Nimuendajú in north-east Brazil, the work done by Dominican friars in Peru, and the publications of the Institute of Tucuman and those sponsored by J Imbelloni in Buenos Aires. According to A. Métraux, South American anthropologists are not sufficiently aware yet of the need of organizing and carrying out field work, which is largely done by foreign students, to mention only R. Karsten, A. Métraux, M. Gusinde, and R. H. Lowie. The second instalment of M. Gusinde's *Ethnography of the Firelanders* was published in 1937 and deals with the culture of the Yamana. (B. MA.)

ANTIGUA: *see* LEEWARD ISLANDS

ANTI-SEMITISM in 1938 was again centred in Germany. The annexation of Austria with her 200,000 Jews (not counting those of partly Jewish origin) gave a new impulse to the anti-Jewish drive of the Nazi regime. In Austria, a few days after the occupation by German troops, drastic measures were adopted against the Jews. Thousands were arrested, among them the communal leaders and some prominent men like the world-famous ear specialist, Professor Neumann (who was soon released again), and Baron Rothschild (who is still in prison). In the streets of Vienna Jews were rounded up to scrub the pavements and wash motor-cars. Jewish businesses were occupied and Nazi commissaries installed. In many cases the Jewish owners were compelled to sell out at prices fixed by the Nazi Party. From some of the provinces, particularly in Burgenland, the majority of the Jewish inhabitants were forcibly expelled, and in some cases put across the border during the night without passports. A few weeks after the occupation, all the racial laws of Germany came into force in Austria, thus depriving thousands of Jews of their livelihood. The anti-Semitic drive in Austria brought renewed vigour to anti-Semitism in Germany. After some anti-Jewish riots in Berlin and other towns, new laws were issued compelling all Jews possessing more than 5,000 marks (roughly £400) to register all their property with the government, and making it compulsory for all Jewish shopkeepers to mark their shops conspicuously with their names in white letters. Soon afterwards Jews were expelled from certain important branches of trade. They were not allowed to continue as estate agents, commercial travellers, and agents, etc. By Sept. 30, all Jewish doctors, including ex-servicemen, were forbidden to continue to practise. By Nov. 30, the same ban was extended to all Jewish lawyers, again including ex-servicemen.

At the end of October many thousands of Jews of Polish nationality living in Germany were expelled at a few hours' notice and transported to the frontier. Only very few were admitted into Poland, the rest being either taken back to Germany or compelled to stay in no-man's-land. Their sufferings drove a Polish-Jewish youth in Paris, named Grynszpan, to desperation. On Nov. 7 he murdered Ernst vom Rath, Third Secretary of the German Embassy in Paris. This crime was followed by organized pogroms throughout Germany, which started in all towns at two o'clock in the morning. Most of the synagogues were burnt down, all Jewish shops were destroyed, and some looted. Many

thousands of Jewish men were sent to concentration camps. A new law was issued following the pogroms, which barred all Jews from retail trade, imposed a collective fine of 1,000,000,000 marks (roughly £83,000,000) on the Jewish community in Germany, and compelled the owners of the destroyed shops to restore them at their own expense, the insurance money going to the government The fine amounts, according to government estimates, to one-fifth of the total Jewish property in Germany, and according to neutral estimates, to about one-half. The pogroms led to strong reactions in public opinion, particularly in Great Britain and the United States, and to a kind of diplomatic break between Germany and the United States.



In Rumania, the anti-Semitic Goga-Cuza government was deposed by the King in February, and gave place to a more moderate government which, although it did not revoke the anti-Semitic laws, watered them down in practice.

In Poland, no striking new developments took place, except a law prohibiting ritual slaughter, and another law enabling the government to revoke the Polish citizenship of people who had not lived in Poland for a considerable time, There were frequent anti-Jewish riots, particularly in the universities, and a general anti-Semitic trend in policy.

In Hungary a law was passed in May introducing a *numerus clausus* for Jews in many walks of life, including business life. On the other hand, the government suppressed violent anti-Semitic outbreaks, the radical anti-Semitic party of Major Szalasi was dissolved and its leader sent to prison.

In Italy, which had not known any anti-Semitism for a long time, the fascist government suddenly turned anti-Semitic in July. All Jews who had settled in Italy after 1919 were ordered to leave by March, 1939, with a very few exceptions. All Jews were barred from schools and universities, whether as students or teachers. All Jews, with the exception of those who had some special distinction such as volunteers in any of the Italian wars, or early members of the Fascist Party, were expelled from the Fascist Party and were forbidden to own more than a limited quantity of land, factories, or to hold leading business positions. Marriages between Jews and Gentiles were prohibited. The Italian anti-Jewish legislation is based on the racial, not the religious principle, although racial inquiry goes back only to parents, and not to the grandparents as in Germany. (L. G. M.)

AQUARIUMS. In Great Britain the aquarium of the Zoological Society of London received a present of African lung-fish from Captain C. R. S. Pitman, Game Warden of Uganda. The lung-fish has its swim-bladder converted into an air-breathing organ, and spends months encased in mud with a narrow breathing tube connected with the air. It was in this condition that they travelled. The Duke of Bedford presented a collection of large golden trout bred on his Tavistock estate. The New York Aquarium sent a shark-sucker, which attaches itself to a shark and feeds on the food dropped by it. Mr. H. Vinall, of the Aquarium staff, went to the Red Sea to supervise the collection and transport of fishes. He brought back several new to the Aquarium, including the Eastern swallow-tail wrasse, angel fish, and boar fish. Poisonous fishes received included a sting-ray from Madeira and a lesser weever from Brighton. From Florida came a porcupine fish capable of inflating its body until it becomes spherical. A large octopus, 4 ft. in span, came from Madeira and also a crab which holds a sponge on its back as a screen from its enemies. From California came a

Fox Photos]

AFRICAN LUNGFISH, AT THE AQUARIUM OF THE LONDON ZOO

green moray or giant eel, 4½ ft. long. Amazon angel fish were successfully reared and Chinese Paradise fish were bred.

Brighton aquarium opened a new scenic section for crocodiles and alligators, and thirty additional tanks for tropical and exotic fish, and issued a new edition of the *Aquarium Guide*. New exhibits included angler fish, owl fish, and three baby penguins hatched in the aquarium. Chester and Maidstone Zoos both opened new tropical fish tanks.

At Colombo, Ceylon, 175,000 rupees were granted to meet the cost of the new aquarium, a necessary adjunct to a fisheries research station and hatchery. (V. R.)

In the United States the new aquarium, the Marine Studios, near St. Augustine, Florida, was formally opened on June 23. The extremely large size of the two aquariums comprising it make possible the display of marine animals of a size not ordinarily seen in captivity. On June 1 a municipal aquarium was opened to the public at Baltimore. Although one of the smaller aquariums of America, it displays both native and tropical species. There are in all 42 display aquariums. The Toledo Zoological Society of Toledo, Ohio, has nearly completed a pleasantly designed aquarium for fresh-water displays. There are 41 large tanks for running water and 25 small ones for standing water. New York City, Winter Park (Fla.), Santa Cruz, and San Diego (Calif.) are laying plans for new aquariums.

Other cities in various parts of the world with similar plans include Havana, Rotterdam, Montreal, Shanghai, and Tokyo.

ARABIA. Although it has been said of the Arabian Peninsula that its normal occupation is war, it has to be recorded that the year 1938 was one of unbroken peace. Everywhere life went on smoothly, and although the world situation preoccupied the minds of Arabian statesmen, and although the Palestine situation preoccupied the minds of nearly all Arabs, no untoward event occurred throughout the Peninsula.

Stable internal conditions are often reflected in the readiness of eminent men of State to travel abroad, and if this criterion be correct, it can be said of Saudi Arabia, the Yemen, and Oman that they presented reassuring signs.

Imperial Airways]
SHARJAH ON THE OMAN PENINSULA, REFUELLING STATION ON THE ENGLAND–INDIA–AUSTRALIA AIR ROUTE

For from Saudi Arabia, the Crown Prince, the Emir Sa'ud, eldest son of King Abdul Aziz, paid a visit of several weeks to Great Britain during the summer; the second son of the Imam of the Yemen, the Seif-ul Islam al Husseini, was abroad in Europe and Asia; and in the earlier half of the year the Sultan of Muscat and Oman himself paid a prolonged visit to Japan, the United States, and Great Britain.

A notable tribute to the security prevailing in Saudi Arabia and to the esteem in which Ibn Sa'ud is held was provided by the visit paid by the Earl of Athlone and the Princess Alice to that desert kingdom. In the spring of the year these two members of the British Royal Family journeyed from one end of the Arab kingdom to the other, from Red Sea to Persian Gulf, and expressed their open admiration of the regime which they witnessed.

The foreign affairs of the various States comprised in the Peninsula were conducted without a hitch. In January the text of the treaty which the Yemen had made the previous September with Italy was published, the chief provision being that Italo-Yemeni friendship, symbolized in the sending of arms from Rome, was to endure on the basis outlined in the treaty for 25 years; later in the year the outstanding differences between the Aden government and the Yemen were resolved, with the exception of that concerning the ancient site of Shabwa, which Aden claimed as part of the Hadhramaut, and therefore under British influence, while the Yemen claimed it as its own. However, there were good reasons at the end of the year for assuming that this difficulty would be amicably resolved.

The Anglo-Italian Agreement signed in April, and ratified in the following autumn, had direct reference to the Arabian Peninsula, the principal point in this regard being that both Italy and Great Britain pledged themselves to respect the integrity of Saudi Arabia and the Yemen.

On the economic side, the most considerable development concerned the discovery, in October, of petroleum in commercial quantities in Ibn Sa'ud's eastern province, the Hasa. There a concession is held by the Standard Oil Company of California, which has formed a subsidiary company for Saudi Arabia. Already this company has done well with the exploitation in the neighbouring island of Bahrein. No doubt now exists of the presence of large quantities of oil in eastern Arabia, and the exchequer of Ibn Saud will benefit to the extent of a royalty of four shillings per ton of petroleum exported. Elsewhere, whether in Kuwait or on the Red Sea side of Saudi Arabia, prospecting for oil continues, but so far the product has not been found in commercial quantities. In Oman the concession that has been granted to a subsidiary of the 'Iraq Petroleum Company has not yet been implemented, owing to uncertain conditions in the interior. (K. Wi.)

Area and Population:

Total Area (estimated) 1,000,000 sq miles
Total Population (estimated) (1937) 9,300,000

Territory	Area (Sq. M.)	Population	Capital
Saudi Arabia	800,000	4,500,000	Riyadh
Yemen	75,000	3,500,000	San'a
Oman and Muscat	80,000	500,000	Muscat
Kuwait	—	80,000	Kuwait
Trucial Sheikhs	6,000	80,000	—

Language. Arabic
Religion. Mohammedan
Rulers: Saudi Arabia, King Ibn Sa'ud; Yemen, Imam Yahya Muhammad Hamid ed Din; Oman and Muscat, Sultan Sayyid Said bin Taimur; Kuwait, Sheikh Ahmed Ibn Jabir al Subah.
Products. Dates, hides, sheep, camels, wool.
Overseas Trade, 1937:

Saudi Arabia and Yemen,	Imports from U.K.	£87,368
Saudi Arabia and Yemen,	Exports to U.K.	£56,077
Oman and Muscat, Trucial	Imports from U.K.	£38,307
Oman and Kuwait	Exports to U.K.	£13,208

Currency. The British gold £ is the basis.

ARABIC LITERATURE. Since 1920 the centre of modern Arabic literary activity has lain in Egypt. Only in poetry is the Egyptian predominance challenged to any extent in other Arabic-speaking countries, while the output of the formerly active Syro-American groups in the U.S.A. and Brazil has dwindled. The principal feature of modern Egyptian literature has been its experimentation with new literary techniques, especially in adapting the standard written language to modern subjects and style. The most suitable field for this purpose is found in the short story, which permits of a cautious infiltration of vernacular usage; the production of these has greatly increased in recent years, and has led to similar experiments in 'Iraq and elsewhere. Some more ambitious attempts at full-length novels have been made with varied success. The most remarkable is *Return of the Spirit*, by T. el-Hakim, which, like an earlier autobiographical work, *The Days*, by Taha Hussein, has been translated into more than one European language.

Since social and economic conditions, however, tend to force writers to rely for publication mainly on literary journals, the great bulk of the literary production takes the form of single or collected essays. This output of belles-lettres reflects the competing influences of mediæval Arabic literature and the modern European literatures, both French and English, and to a lesser extent Russian and German, resulting in a wide conflict of standards in style and language. It is noteworthy also that some women writers are numbered among the more prominent essayists.

In contemporary poetry the instability arising from the conflict between classical tradition and modern technique is still more marked. On the whole, the classical tendency predominates, although the subjects (and more rarely the form) may be ultra-modern, as, notably, in the work of the 'Iraqi poet ez-Zahawi and some of the more recent lyric poets. The vernaculars are extensively used in popular poetry and songs, but have gained no recognition as yet in literary circles, even while the popular productions are appreciated in themselves. They have also entered into the attempts to create a native Arabic theatre, but the efforts made in this direction, never very strong, have latterly suffered a check. On the other hand, one of the

most promising recent developments is the rise of a literary drama, both poetic and prose, the latter influenced to some extent by French symbolism.

See: "Modern Arabic Literature", article and bibliography by I. Kratchkovsky in *Encyclopædia of Islam, Supplement No. 1* (1934) (H. A. R. G.)

ARBITRATION, INDUSTRIAL. In Great Britain the accentuation of the recent trend of trade unionists' and employers' organizations towards negotiation and arbitration in place of strikes or lock-outs rendered 1938 industrially notable. Increased activity in industry and a decided rise in trade union membership, accompanied by a whole series of claims for improvement, found the machinery of arbitration and conciliation sufficiently elastic and well based to overcome most difficulties. In spite of this, the number of disputes rose from 808 in 1937 to 1,112, of which 457, in the mining industry, were of a purely local character. A series of disputes in engineering and shipbuilding (particularly aircraft and armament production) led to 220 stoppages; the great majority of them were unofficial, but some of them led to the extension of existing arbitration machinery.

During the year additional trade boards were set up, particularly in the baking trade; two new joint industrial councils were formed, and two constituted on a wider basis; the industrial court issued twenty awards and the Civil Service arbitration tribunal fifteen; single arbitrators and *ad hoc* boards dealt with six cases; and Ministry of Labour conciliation officers were concerned in the settlement of 66 disputes. Industrial arbitration and negotiating machinery dealt, not only with wage claims during the year, but with amenities like holidays with pay, and with the retoration of conditions prior to 1931, when drastic alterastions had been imposed on accepted conditions in many industries. Two noteworthy agreements were also reached. In the printing industry a reduction in normal working hours from 48 to 45 a week was provided for, and in flour milling an agreement concluded by the industry's joint industrial council gave a 42-hour week to shift workers and a 44-hour week to weekly-wage operatives, while the payment of sums to secure the full weekly wages of employees working short time in certain circumstances was also agreed upon. An important principle was contained in the award of increased rates to 150,000 postal workers at the end of the year by the Civil Service Arbitration Tribunal, which usurped the prerogative of the Treasury and dealt with promotion.

Considerable progress was made in preparation for the establishment of new machinery for the retail distributing trade, and under the auspices of the Ministry of Labour committees representing all sections of the industry have been working out a plan for the establishment of regional trade boards. Many difficulties have been overcome; the original plan has been considerably amended, and an accepted plan will probably be submitted to the Ministry of Labour for formal ratification in the spring of 1939. In the meantime considerable progress was achieved by the Shop Assistants' Union in persuading local grocery chain stores to sign agreements accepting the union's minimum wage standards. Two of the greatest tests were placed on existing negotiating machinery during 1938, and at the end of the year, although no finality was reached, it seemed probable that the machinery would stand the strain. In the engineering industry claims put forward by the two important union groups for higher wages and improved conditions for more than 1,000,000 workers were rejected by the employees' organization as being inopportune because of the state of trade, and similar claims by the railway unions were rejected for similar reasons; in each case the union executives are to review the situation, with the possibility of renewing their claims early in 1939. (V. B.)

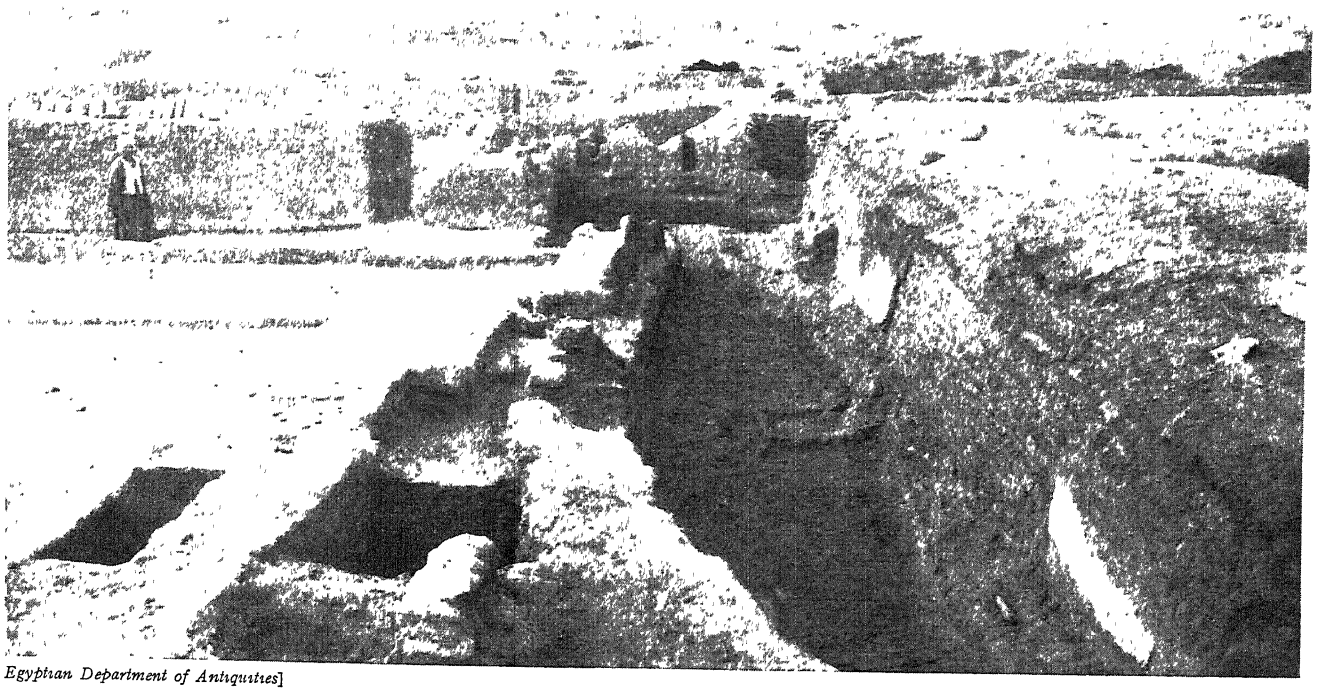
ARCHÆOLOGY. In the following article the eastern and western hemispheres are separately considered; and in the case of the eastern hemisphere, which is taken first, certain archæological periods are taken in chronological order.

Old Stone Age. *Extensions of Flake-cultures* in regions where no Lower or Middle Palæolithic remains had previously been defined, have been revealed by explorations conducted during 1938. Arabia, it had been expected, would prove to have been a province of the Hand-axe cycle in rainy (pluvial) periods corresponding to the European Ice Age and would serve as a link between the Chellean-Acheulian cultures of Africa and Palestine on the one hand and of India on the other. But in southern Arabia in gravels in the valley of the Wadi Amd, a tributary of the Wadi Hadhramaut, Miss G. Caton-Thompson and Dr. Gardiner have found only Levalloisean flake-tools. These are crude and little specialized in workmanship, and are found principally in the gravels of a terrace 10 m. above the present wadi bed which had been laid down in a period of increased rainfall, apparently the latest of several pluvials. No Upper Palæolithic remains were found, and a microlithic culture of mesolithic aspect seems, in fact, to belong to early historical times (*Nature*, July 23, 1938).

On the Turkish plateau flake industries were generally expected. Prof. Shevket Aziz Kansu has, in fact, now found such *in situ* in high gravels at Etiyokuşu, near Ankara. The tools are again produced by the Levalloisean technique, but some approximate in form to those of the European Mousterian culture.

In the Balkans the first traces of Middle Palæolithic men have been discovered by Dr. Dorothy Garrod in the cave of Batcho-Kiro, near Drenovo, Bulgaria. In the lowest layer of the cave good Mousterian implements were discovered. Three later occupations are characterized by Middle Aurignacian tools. These Upper Palæolithic remains help to link up the Aurignacian of Kurdistan, Palestine, and the Crimea with the "Middle Aurignacian" of Central and Western Europe.

Fossil Men. The first authentic skeletal remains of a maker of hand-axes and the oldest satisfactorily dated member of our species (*Homo sapiens*) seem to be represented by the fragments known as the Swanscombe skull. None of the authentic Lower and Middle Pleistocene fossil men, discovered before 1935, could confidently be attributed to the makers of Chellean or Acheulian hand-axes (once regarded as the type tools of Lower Palæolithic cultures) nor to direct ancestors of modern man. In 1935–36 Mr. A. T. Marston discovered two bones of a skull in the gravels of the 100-ft. terrace of the Thames, exposed in the Barnfield gravel-pit at Swanscombe, Kent. A committee of the Royal Anthropological Institute has now presented a report on Mr. Marston's discovery, which was discussed at the Cambridge Meeting of the British Association for the Advancement of Science. It appears that the middle gravels, from which the skull came, were deposited in an interglacial period, probably the "great interglacial" corresponding to Mindel-Riss in the Alps. The fauna from the skull horizon was essentially Middle Pleistocene. The tools consisted mainly of Middle Acheulian hand-axes and flakes, normally associated with such. Of the skull itself



only the occipital and left parietal survive, but they fit together perfectly. In the view of Prof. le Gros Clark, Dr. Morant, and Sir Arthur Keith, the fragments would be more appropriate to a man (or to be exact a woman) of modern type (*Homo sapiens*) than to the ape-like varieties (*Sinanthropus, Pithecanthropus, Homo neandertalensis*), which British anthropologists regard as aberrant and extinct genera or species of the human family. None was explicitly associated with the manufacture of hand-axes Swanscombe thus supports the view that the hand-axe cultures were created by our direct evolutionary ancestors (*Journal of the Royal Anthropological Institute*, 1938; in the previous volume the discoverer presents an independent report on the find differing in some respects from the Committee's conclusions).

Mesolithic. The mesolithic period was created to fill the gap between the end of the Old Stone Age, coinciding with the close of the last Ice Age, and the belated establishment of a neolithic economy in north-western Europe. The cultures (Azilian, Tardenoisean, Maglemosean, etc) which occupy it are accordingly partly contemporary with neolithic and early metal age civilization in the Near East (*see* following paragraph). It has been assumed that their authors were degenerate and impoverished descendants of the reindeer-hunters, who in the favourable conditions of the latest glacial episode had created the brilliant Magdalenian culture of France. Whatever their origin, the extent of their degradation and impoverishment has been somewhat overestimated. Dr. Grahame Clark's excavations during 1937 and 1938 near Farnham, Surrey, have shown that some Tardenoisean hunters at least erected substantial huts wherein to shelter. The hut excavated in 1938 was an irregular oval in plan, measuring 27 ft. by 15 ft. Its floor had been excavated in the soil to a maximum depth of 3 ft. It is the fourth to be explored of a group of dwellings, located near a permanent spring. Similar dwellings have recently been discovered in France too at Piscop, Seine-et-Oise. Since 1918, Soviet archæologists have recognized even more substantial dwellings, excavated in the löss by mammoth-hunters who lived in the Ukraine during the Ice Age itself. The pit-dwelling is not therefore an innovation in mesolithic times, but a legacy from the Old Stone Age like the economy of the pit-dwellers. (To be published in *Proc. Prehistoric Society*, 1939; cf. *Antiquity*, xi (1937), 476.)

Neolithic. *Antiquity of the Neolithic Revolution in the Near East.* The revolution, which put man in control of his own food supply by cultivating plants and breeding animals and so made civilization possible, is generally supposed to have begun in the Near East; for only there were suitable plants and animals available. Its starting-point has not yet been defined. But its enormous antiquity in the Fertile Crescent (extending from Egypt across Palestine and Syria to the Persian Gulf) has been dramatically demonstrated by the completion, in the winter of 1937–38, of the culture-sequence at Tepe Gawra, near Mosul, in ancient Assyria. This truly "great mound", no less than 104 ft. in height, is composed entirely of the débris of buildings erected successively on the site. Twenty-six major occupational levels can be distinguished, chiefly by reconstructions of a group of shrines which occupied the centre of the settlement. The seven uppermost levels belong to the historical period and represent the fourteen centuries or so immediately after 3000 B.C. The remaining nineteen layers, in all 90 ft. thick, are earlier than 3000 B.C. and purely prehistoric. But layers VIII to XIV (counted from the top) run parallel to prehistoric cultures, familiar in Sumer (southern Mesopotamia), and there termed respectively Jemdet Nasr (latest), Uruk, and al'Ubaid (earliest) Below level XV at Gawra accurate parallels cannot be found in Sumer, a geologically recent delta that had only just become habitable in al'Ubaid times, but rather at Samarra farther north. Then levels XX to XXV represent the Halafian (Tel Halaf) culture already familiar from Dr. Mallowan's excavations at Arpachiya (also in Assyria) and at Chagar Bazar, farther west on the Khabur in Syria. The cobbled village streets of Arpachiya and its monumental circular buildings of mud brick, fine pottery superbly painted with polychrome patterns, seals and amulets carved in stone (one from Gawra adorned with a swastika) and instruments of imported obsidian reveal the high cultural level already attained. But even in the still earlier level, Gawra XXVI, pottery was already being painted in a style encountered also farther west at Judeideh in Syria.

The gigantic accumulation of débris gives a graphic indication of the time span involved, though it cannot accurately be evaluated in years. Simple villagers would hardly rebuild a temple more than once a century. Prof. Speiser's estimate of 4500 B.C. for Gawra XIX seems quite conservative. But whether the earliest settlement was founded nearer 5000 or 6000 B.C., it was still far in advance of the self-sufficing food-producing hamlets which represent the classical neolithic cultures in north-western Europe (Speiser, "Closing the Gap at Tepe Gawra", in *Asia*, xxxviii (Sept. 1938), 536–44).

Diffusion of Neolithic Economy. After the publication of W. A. Heurtley's *Prehistoric Macedonia* (Cambridge, 1938), the neolithic cultures of Europe can be seen as the last belated outliers in a continuous series of inter-related cultural groups extending from Hither Asia across the Turkish plateau and the Balkans and along the Danube thoroughfare with its extensions down the Vistula, Elbe, and Rhine to the Baltic and North Sea coasts. Heurtley's book does much to bridge the former Balkan gap. The "trade" maintaining contact between the several disparate groups in Central Europe has been elucidated by E. Buttler's study, published in *Marburger Studien*, 1938. *Spondylus* shells imported from the Mediterranean occur throughout the "Danube thoroughfare" and right down to the Lower Vistula and the Middle Rhine. Even pots, and presumably their contents, were transported over long distances—for instance, from the lower Main near Frankfurt to the environs of Cologne and from the region round Szeged in southern Hungary northward to Silesia and southward across the Danube to Vinča, near Belgrade. And to the last-named village were brought fayence beads from the Near East. None of the imports can be used to date the neolithic villages in which they are found. A maximum date towards 5000 B.C. would not affect their position in the cultural and chronological scales as inferior to contemporary Oriental settlements and later than say Gawra XXVI. But a short chronology putting the arrival of neolithic peasants in southern Germany rather after 3000 B.C. receives support from newly recognized Egyptian imports buried in graves of the succeeding Early Bronze Age. In graves of that phase round Szeged and in Moravia the dead were wearing segmented fayence beads of a type current in Egypt about 1400 B.C. But the Early Bronze Age on the Danube is admittedly contemporary with the late neolithic of Denmark and North Britain. Accordingly, about 1500 B.C. the archæologist can survey a continuous hierarchy of cultures descending from the metropolitan

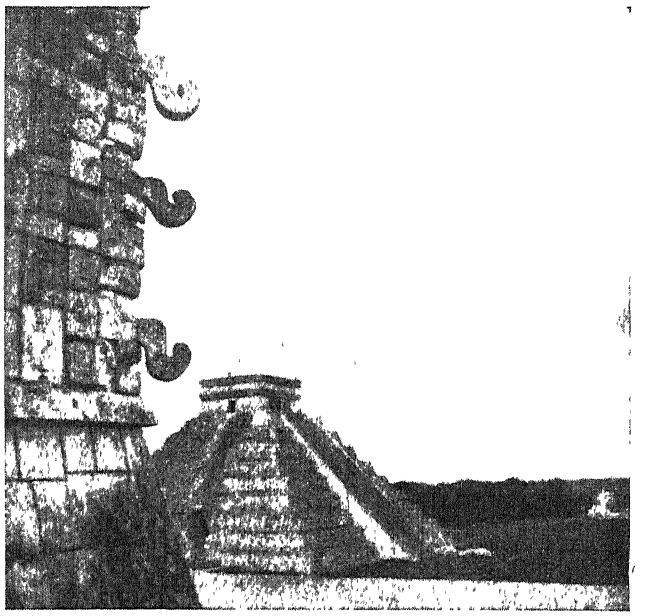
THE 'BOAT GRAVE', AT SAQQARA, PARTLY BURIED BENEATH THE FOUNDATIONS OF THE MASTABA ON THE LEFT

cities of Mesopotamia through literate but provincial cities in Syria, Anatolia, and peninsular Greece, illiterate but bronze-using townships in the Balkans, and rustic Bronze Age villages in Czechoslovakia and south Germany to self-sufficing hamlets in the north, where metal was still normally unobtainable. A thousand years earlier on the short chronology a similar picture would hold good, but with a gathering economy in place of food-production in the north, no bronze north of the Balkans and literacy confined to Mesopotamia, Syria, and Egypt. This zoning is precisely what should be expected on the diffusionist hypothesis.



Neolithic Habitations. The neolithic cultures of north-western Europe (like that of the Maori in the nineteenth century A.D.) are belated survivals of a simple food-producing economy that had originated long before in Western Asia. Being known chiefly from graves and the foundations of perishable huts, the standard of life prevailing in neolithic societies was liable to be under-estimated. A more accurate appreciation of the amenities of neolithic life, even in such a peripheral region as Orkney, has been made possible by a discovery during 1938 at Rinyo in Rousay. A beaker (a type of vase distinctive of the very beginning of the Bronze Age in Britain) was there found among the latest relics in a hamlet in every other respect parallel to the famous "village" at Skara Brae on Orkney Mainland. The latter, too, must therefore have been occupied somewhere between 2000 and 1500 B.C., though its architecture seemed so advanced that dates as late as A.D. 400 had previously been suggested. Both hamlets consisted of roomy stone huts some 15 ft. square. Each hut was equipped with a kerbed central hearth on which peat was burned. On either side of the hearth were enclosures framed with slabs on edge, but otherwise identical with the plank-framed enclosures that served as bed in Norwegian peasant cottages in Setesdal; presumably they served the same purpose. In the wall above each bed were recesses to serve as keeping-places for personal possessions, as in Highland shielings, and against the rear wall stood a dresser formed of two tiers of stone shelves. Small cells in the thickness of the wall were attached to each hut. Stone lintelled drains under the hut-floors carried off moisture to a central conduit draining the whole settlement. In the wind-swept Orkneys absence of trees compelled the villagers to build their huts and make their furniture of imperishable stone, and at Skara Brae a sand-dune has preserved the house walls to a height of 8 ft. Elsewhere in Britain kindred communities must have occupied no less commodious and comfortably furnished premises constructed of perishable wood. Pottery like that from Rinyo and Skara Brae has, in fact, been found at several sites in eastern Britain, notably on an old land-surface on the Essex coast that was submerged about the beginning of the Bronze Age some 3,500 years ago (Childe, *Skara Brae*, 1931).

Bronze Age. More certainly than stock-breeding and agriculture did the use of metal tools originate in the Ancient East. The demand for metal in Egypt and Mesopotamia, when an economy based on trade and industry had created there populous cities, was a main cause of the diffusion of metallurgical knowledge even in Europe. In Egypt, the second revolution which transformed some villages into cities is associated with the rise of the Dynasties, with the first Pharaoh who united in a single kingdom the Nile valley up to the First Cataract. The tomb, probably constructed for the first Pharaoh, Aha, was discovered in the winter of 1937–38 at Saqqara, south of Cairo, near the city of Memphis he founded. Aha was previously thought to have been buried in a much smaller subterranean chamber near Abydos, in Upper Egypt, explored last century by Petrie, but his name alone recurs repeatedly on objects recovered from the new tomb. The superstructure was an immense brickwork rectangle (*mastaba*) 42 m. (46 yds.) long by 15·5 m. (17 yds.) wide. The walls,

still standing, 5½ ft. high, are relieved by alternating buttresses and recesses, imitating the matting and timber façade of the king's palace, and faced with white stucco They enclose 27 magazines which cover five subterranean chambers once roofed with wood. These, the actual burial chambers, had been plundered long ago, and only the scattered bones of two adults, smashed stone vases, and fragments of wooden furniture survived.

The westward extension of Mesopotamian civilization to which European metallurgy is more explicitly indebted is illustrated by Dr. Mallowan's excavations in Syria. Tel Brak, south of Nisibin, lies on the great natural route westward from Assyria between the Turkish mountains on the north and the Jebel Sinjur and desert to the south. Here Mallowan uncovered the ruins of a great palace, founded by Naram-Sin, fourth king of the Dynasty of Agade (Akkad) about 2500 B.C. It is dated by bricks, stamped with the king's name, and covered an area of 90 m. by 90 m. (nearly 100 sq. yds.); the apartments were grouped about a central court 40 m. (45 yds) square. A contemporary private house was furnished with a cemented bath. Under Naram-Sin's palace was the stump of an earlier temple-tower or ziggurat, measuring 60 m. (65 yds.) square at its base and still standing to a height of 10 m. or nearly 33 ft. This monumental structure seems to have been built rather before 3000 B.C. in the Jemdet Nasr period. For from its foundations the excavator recovered stone and fayence amulets in the form of animals realistically carved in the style current at Ur and Erech in Sumer (Lower Mesopotamia) in Jemdet Nasr times. So even before 3000 B C. genuine cities supported by specialized industries and kept in touch with Mesopotamia by regular trade and in which accumulated wealth was expended on the erection of monumental temples had extended as far west as the Khabur region. (For new discoveries bearing on the chronology of the European Bronze Age and its connexions with the Orient, *see above*, § *Diffusion of Neolithic Economy*.)

Iron Age. Much fresh light on the economy and sociology of the pre-Roman Britons has been obtained through the minute examination of a small settlement at Odstock, near Salisbury, by the Prehistoric Society under the direction of Dr. G. Bersu, the famous German excavator. The site, occupied round about 200 B.C., covers some six acres, and was at one time surrounded by a bank and ditch which cannot, however, rank as defensive works. Within the enclosure stood several circular huts, the largest 45 ft. in diameter. Their walls, presumably of wattle-and-daub, and thatched roofs were supported by posts, the sockets of which alone remain to reveal the plans of the houses. The numerous pits within the area cannot have been dwellings, as has often been supposed, but served as storage silos, working-places, and rubbish-pits. From the dimensions of the silos it can be inferred that as much as fifty tons of grain were stored in a single season. The excavators believe that before storage this grain must have been dried in ovens, and remains of suitable kilns have actually been found. The practice of kiln-drying of grain still survives in the Hebrides, but had been thought hitherto to begin with the Roman occupation. In point of fact, the rural economy of the Celts in Britain has been unduly disparaged. The Iron Age Britons are vindicated from the charge of living habitually in incommodious and unhealthy pit-dwellings by the Odstock excavations as are their neolithic forerunners by the new dating of Skara Brae (*see above*, § *Neolithic Habitations*). (V. G. C.)

MAYA PYRAMID AT CHICHEN ITZA, YUCATAN, UNCOVERED BY PROF. MORLEY OF PHILADELPHIA INSTITUTE

Western Hemisphere. During 1938 progress was made in the reconstruction of the development of the many native cultures of the New World by continued field investigations, laboratory studies, and publication of results.

The problem of the antiquity of man in the New World continued to occupy the interest of American archæologists and has made considerable progress. The work being done by the Bureau of American Ethnology at the Lindenmeier site in northern Colorado was continued, and resulted in additional information concerning the activities of the individuals who once occupied this Folsom village site. The recorded distribution of materials of the Folsom stone complex was extended as the result of reconnaissance work in the Canadian area of Saskatchewan, where materials belonging to this category were discovered on the high plains east of the mountain region. Stimulated by the apparently successful geological analysis of the deposits associated with sites in which Folsom materials have been found, students of the subject working in the central Plains continued to study intensively the conditions surrounding certain of the deeply buried sites of that area.

Investigations on this problem were also carried forward in the Pacific Coast area as a result of the discoveries made in recent years along the beach levels of what are now extinct lakes in southern California. The most interesting of the finds were those made as a result of reconnaissance work sponsored by the South-west Museum and the Carnegie Institution of Washington in Clear Lake Park, northern California. A site was discovered on a fossil alluvial fan laid down during the pluvial period following the glacial retreat, on the surface of which Folsom points were found in association with certain California-type early implements. Although the Folsom points did not extend much below the surface, other articles related to the California complexes occurred at a considerable depth. Definitive conclusions cannot yet be drawn, but this site may in time yield a relative chronology of the older stone implement complexes of the region. Farther to the north, in eastern Oregon, field work in several caves revealed a confusing archæological picture which may furnish additional evidence on early man in America.

The field studies of the archæological remains of the

several areas of North America were continued during 1938, frequently with the assistance of the Works Progress Administration This was particularly true of the South-west, the Great Plains area, and the eastern United States Valuable contributions were made by the Field Museum of Natural History expedition to south-western Colorado The Museum of Northern Arizona made a special study of what may prove to be a new archæological complex in north central Arizona One of the largest and most significant field operations in the South-west was that of the Peabody Museum at Harvard, which has been studying the ruins of the old Hopi village of Awatovi for several years.

During the summer, field work was carried on in most of the Great Plains States lying between the Mississippi river and the mountains, especially in the northern section. The increasing field activities in the south-eastern United States, assisted by the Works Progress Administration, were continued. The investigations under the auspices of the Tennessee Valley Authority yielded good results, as did also expeditions sponsored by a number of local organizations Archæological sites in the middle Atlantic coast region and the north central States received their share of attention from field workers, who were, in most cases, carrying out field programmes of several years' standing.

As the archæological problems and materials relating to the better-known areas are becoming more clearly understood, more field investigations have been undertaken in those areas which until recent years received relatively scant archæological attention Field parties worked in the New England area On the west coast the University of California supported a third season's work in archæological sites near Sacramento and Stockton, and sponsored a reconnaissance of archæological records in British Columbia. In eastern Oregon representatives of the Oregon State museum investigated a number of caves, and in Montana archæological field work was carried on under the auspices of the Works Progress Administration. In the Alaskan area further field studies were undertaken by Dr. Hrdlicka, of the U.S National museum, in the Aleutian island chain.

A significant trend during 1938 was the growing interest in the historically documented sites occupied by Indians subsequent to their first contact with Europeans. This interest, which probably had its beginning in the south-eastern area, was reflected in the field work carried out in Pennsylvania and Michigan, as well as in some of the work in the Southern States. A field party from Columbia University working in co-operation with the State Historical Society of North Dakota, studied historic sites in that State. In the South-west, the important excavations carried on at Awatovi gave special attention to the periods of occupation which were subsequent to the coming of the Spaniards to the Hopi country. No genèral conclusions can yet be drawn from these recent and isolated results, but probably continued studies in historically documented sites may ultimately lead to a definite correlation of the prehistoric records with those furnished by early European travellers.

Further attention was given to archæological problems in the northern Mexican area and, as in the past, the Mexican government took an active interest in the study of a number of different archæological sites in that country. In 1938 the Piedras Negras expedition from the University of Pennsylvania did not, however, take the field.

During 1938 field investigations were exceedingly active in South America, particularly in the Andean region. In addition to the studies carried forward by several museums of the area, representatives from the Munich museum and the Stockholm museum worked in Peru and Bolivia. The American Museum of Natural History sent an expedition to the northern islands of Peru and the Peabody museum of Harvard had a party working in the southern highlands of Peru

These brief statements do not represent all the archæological studies which were undertaken during 1938. In a great number of laboratories, in universities, and museums, detailed investigations were made upon the results of the field work done in previous years. The interpretation and correlation of the field data which result from such laboratory activities enable archæologists to understand more clearly the inter-relationships of the several archæological cultures and to establish a clearer picture of New World pre-history.

As in the past, conferences and scientific meetings served to stimulate archæological research. In August a section of the International Congress of Anthropological and Ethnological Sciences, held in Copenhagen, Denmark, was devoted to New World problems. In the south-west, in August, a conference on the archæological problems of the area was again held in the Chaco cañon in western New Mexico under the auspices of the University of New Mexico. A similar conference, sponsored by the University of Chicago, took place in July at the Kincaid site in southern Illinois. In the eastern United States a number of informal group meetings were held, in which problems relating largely to pottery studies were discussed. There were also annual meetings of the Society for American Archæology, and of the Eastern States Archæological Federation, and joint meetings of several similar organizations.

ARCHBISHOPS' COMMISSION (DOCTRINAL REPORT). The Report of the Archbishops' Commission on Christian Doctrine was published in Jan. 1938, under the title of *Doctrine in the Church of England.* The committee was appointed at the end of the year 1922 with the following reference:

"To consider the nature and grounds of Christian Doctrine, with a view to demonstrating the extent of existing agreement within the Church of England and with a view to investigating how far it is possible to remove or diminish existing differences."

And to these terms (which were addressed to Dr. Burge, then bishop of Oxford, the first chairman of the commission) Archbishop Davidson added that the commission's report "should not be an authoritative statement", but should "be laid before the bishops for them to consider what further action (if any) should be taken."

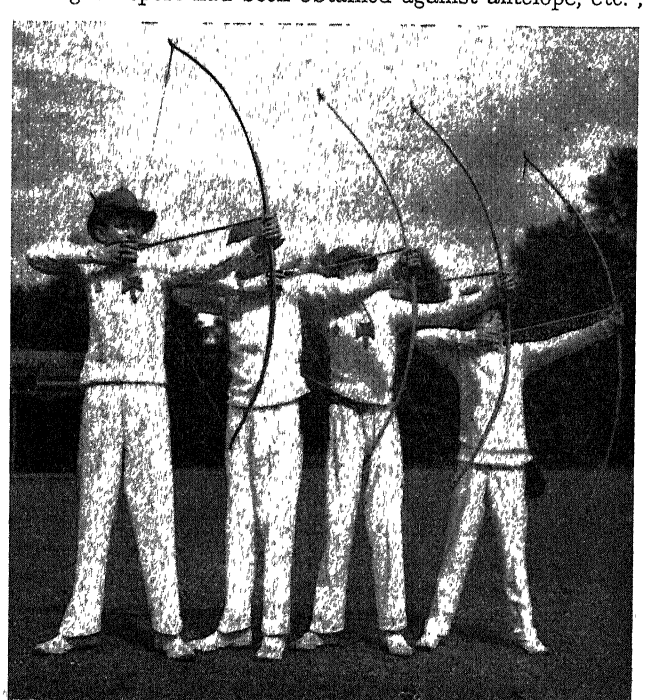
Dr. Burge died in 1925, and his place as chairman was taken by Dr. Temple, then bishop of Manchester. The members of the commission, who numbered about twenty, were representative of many different departments of theological study and also of the various schools of thought in the Church of England.

In character, the Report is not an authoritative statement of Anglican doctrine, but a commentary or survey: a commentary on the existing documents and formularies which the Church of England accepts as authoritative, and a survey of current doctrinal tendencies in the Church to-day. These two elements are closely intertwined in the Report,

with the balance, if anything, on the side of the second; for it was the different tendencies of teaching in the Church at the close of the War, and the serious controversies which these aroused or threatened, that led to the commission being appointed. In form, the Report comprises a series of sections dealing with different aspects of Christian doctrine, together with a number of appended notes and memoranda; and it is unanimous in the sense that it bears the signatures of all the surviving members of the commission. On the other hand, differences of opinion on a number of points are frankly stated within the body of the Report itself, sometimes with indications as to which view has the support of the majority. In some cases the appended memoranda are stated to be the work of individual members of the commission, whose names, however, are not mentioned.

The principal subject of controversy at the time the commission was appointed concerned the sacraments; and this fact accounts for the large proportion of the Report—namely, one-third of the whole—which is devoted to the discussion of sacramental doctrine. The most striking features of this section are the way in which the sacraments are linked up with the whole idea of Christianity as the gospel of redemption; the discussion of the sense in which the Eucharist should be regarded as a sacrifice, and the affirmation of its Godward aspect; and the careful exposition of the various doctrines which have been held as to the presence of Christ in the Eucharist. This is followed by a note on "Reservation and Devotions", in which the commission, whilst declining to express any opinion as to the desirability of these practices, relates them to the various Eucharistic doctrines which it has endeavoured to interpret.

In dealing with the doctrines of the Creed the commission speaks with impressive unanimity upon the truth of the Incarnation, namely, the doctrine which asserts that Christ is both God and Man, and that "the God of Redemption is not other than the God of Creation." The Incarnation is thus set forth as the sheet-anchor of the Christian faith and the starting-point of Christian life and theology. The Report speaks with equal unanimity on the fact of Christ's resurrection. But on the manner in which both these cosmic historical events occurred the Report gives expression to different views held on the subjects, both in the commission itself and in the Church as a whole. Thus in regard to the Resurrection, while the majority affirm the traditional view that "the tomb was empty because the Lord had risen", another view is also stated which is more agnostic in regard to the historical details of the event. In regard to the Incarnation, the two views as to the historicity of the Virgin Birth are stated, but without any indication as to which view should be preferred. The reason for this is implied in the statement (made in the section on the Resurrection) that "The commission does not regard the analysis and detailed evaluation of this evidence, which has been fully studied in recent times, as a task which it is called upon to undertake." The historical questions, that is to say, involved in the doctrine of Christ's birth of a virgin, and of the empty tomb, were regarded as belonging, for the commission's purposes, to the sphere of New Testament scholarship rather than of doctrine; and in regard to both, though in varying degrees, it was felt that the progress of New Testament studies did not yet justify a final verdict.



While the Report illustrates afresh the comprehensive character of the Church of England, the doctrinal factors which have often given rise to controversy are set in a new proportion, and new criteria are indicated for discrimination between truth and error, in whatever school of thought they may be found. The commission's attitude may be summed up as at once catholic and liberal—catholic in its acceptance of the Scriptures and Creeds as the starting-point of its inquiry and in its sympathetic attitude towards the religious experience of the Church throughout the ages; liberal in its candid recognition of the place of reason and criticism in theology, and in the implication that different degrees of authority attach to different statements, even within the Creeds themselves.

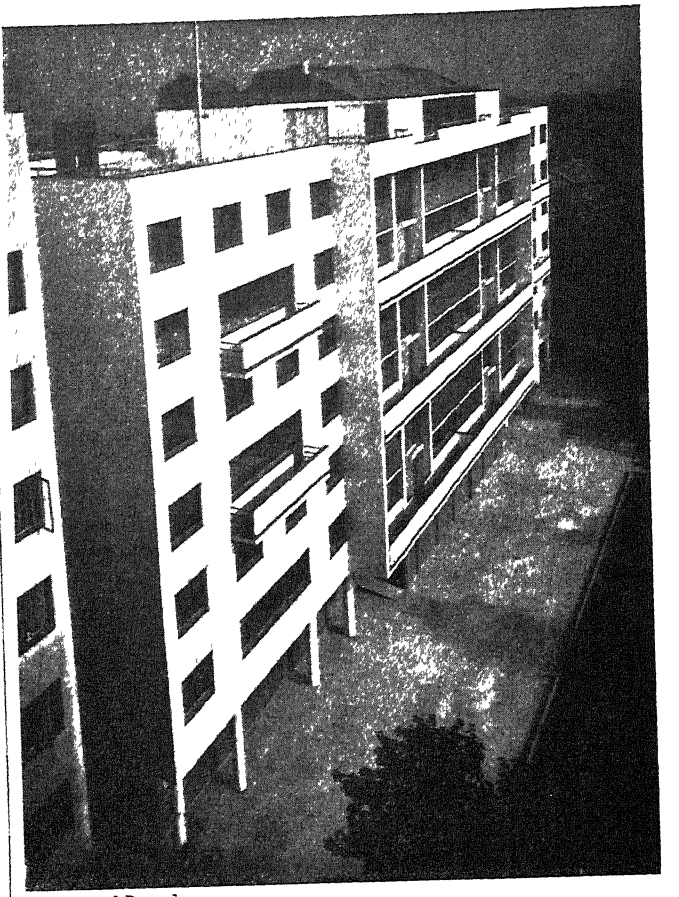
ARCHERY. The eighth annual championship tournament of the International Archery Federation was held in August 1938 at the H.A.C. grounds, Finsbury, London, and attracted competitors from many countries, though the U.S.A. was not represented this year. M. F. Hadas became men's world champion with an aggregate of 2,305; and, for the first time, there was a tie in the ladies' championship, Mrs. Weston Martyr and Mrs. H. Nettleton (both of England) each returning the record aggregate of 1,973.

English archery has experienced a revival in recent years, and there are now over fifty clubs throughout the country. At the end of 1937 the Preparatory Schools' Archery Association was formed; it now has ten members, and it is likely that some of the public schools will take up the sport. Belmont School, Hassocks, won the first annual championship (1,351), Shortenhills, Chalfont (959), being second, and Felsted Junior (953), third.

During the year the Game Warden of Kenya reported that good sport had been obtained against antelope, etc.;

Associated Press]
BELMONT SCHOOL ARCHERY TEAM, WINNERS OF THE INTER-SCHOOL ARCHERY CHAMPIONSHIP



one archer remarked that " on soft-skinned animals the bow and arrow is if anything more effective than the rifle, because it kills instantaneously ".

United States. At the annual tournament of the National Archery Association, which was held in San Francisco, Aug. 8–12, 1938, Miss Jean A. Tenney, Clear Spring, Md., successfully defended her championship title. The men's championship title was won by Pat Chambers, Portland, Oregon

ARCHITECTURE. A review of the political and economic history will show that 1938 did not offer favourable conditions for a consistent development of architecture A contrast between opposed social philosophies caused a divergence in the direction of architectural progress. The spread of nationalism in Europe reflected itself in a further development of national styles. The emigration from Germany to England and the United States of the exponents of the modern movement increased the forces working towards international architecture in these countries. Governments exercised a greater influence either by direct style control or by the examples set in their own extensive building operations. A new military architecture produced ingeniously constructed defence lines, and theories on bombproofing for the towns and buildings of the future. An architecture of propaganda in Germany, Italy, and Russia provided forums for mass meetings; and striking architectural decorations for State visits were designed. Other important influences begun in previous years continued · exhibitions and fairs were held or underwent construction; the consideration of the physical and moral welfare of the population resulted in extensive building operations for housing, playgrounds, bathing resorts, recreational and youth centres.

Modern Architecture. Freedom in modern design is variously interpreted. One group, represented by the CIAM (Congrès Internationaux d'Architecture Moderne), makes a dogma of functional principles and arrives at an architecture expressive of this machine age and international in character. Individual architects, particularly Frank Lloyd Wright in the United States, show a greater leaning towards romanticism; their designs aim primarily at direct emotional appeal. In contrast to the first-mentioned group they are disinterested in scientific reasoning as justification for their art. The uncompromising utilitarian characteristics of the early post-war international style of architecture are undergoing modifications. At the beginning, efficiency, sunlight, and the rigid adherence to a structural system were of greater importance than the proportions and æsthetic organization of the elevations. It is now apparent that more attention is being paid to the sculptural massing of a building and the abstract composition of well-designed voids and solids of the elevations even at the expense of variations in construction. Sentiment for the past, preferences based on association and habits of thinking, have been the greatest obstacles to the broader acceptance of modernism.

Traditional Architecture. The national styles adopted by Germany and now considered in Italy for monumental architecture are traditional. Their forms are derived from historic examples. The more important buildings draw on the classic, if not directly for motives, at least for proportions, symmetry, and principles of design composition. In France, the United States, and England the influence of the academies, though receding, is still in evidence. The traditional domestic architecture of the northern countries is associated with sloping roofs and small isolated windows.

Architectural Review]
HIGHPOINT 2 FLATS AT HIGHGATE, LONDON, 1938, BY TECTON

Present designs vary only in details, the latter being influenced by current fashions or a vogue for a period of revival.

Materials and Methods of Construction. New materials are being developed: first, as cheaper substitutes for costlier natural materials; second, to bring a saving in labour costs; third, for new decorative and structural uses. The long-predicted boom in prefabrication shelters has not begun so far. Progress is now directed towards the prefabrication of standardized units of buildings like wall sections, kitchen units, and as before of complete doors and windows with frames and hardware.

In the United States the use of plywood carrying stresses in glued-up wall and floor sections has been successfully demonstrated by the United States Forest Products Laboratory. Heating specialities have been improved for greater precision in the automatic heating and air-conditioning systems. Panel heating, a system of warming floor and wall panels, is coming unto use. A fluorescent lamp producing better light distribution has been put on the American market.

Some Recent Architecture. In England, by and large, simplicity and quiet surfaces characterize most new buildings of this period. Looking at examples of the various building types, it can be seen that in a great number of recently completed flats the absence of superficial decoration is apparent, and that in an increasing number of cases windows are arranged in continuous horizontal bands instead of in the more traditional isolated vertical spots. The building of modern flats at Highgate (Highpoint No. 2) by Tecton, architects, exemplifies an interesting evolutionary step in the progress of modernism. A trend is here indicated, if an

isolated example can be used for this purpose, of modern functionalism showing a greater concern for decoration While the general flat character established in the first unit has been repeated with the same refinement in the handling of detail, the plan has reverted to the use of classical symmetry, and the overhanging marquees of the entrance are supported by Greek caryatids reminiscent of surrealist paintings.

A great number of unusually large medical institutions have come into existence. High buildings (as exemplified by the Birmingham Hospitals Centre) in contrast to isolated pavilions are now universal for large hospitals because of the opportunity for centralization of services and control and the rapidity of vertical circulation by means of elevators. For a free expression of architectural thought in a country where that is still permitted one must look to the exhibitions The British Empire Exhibition held at Glasgow followed the modern design trend, and in some buildings echoed the Paris Exhibition of 1937. A greater attempt was made, however, to break surfaces and spaces by some form of division to obtain decorative patterns. In another smaller way an interesting exhibition held in London by Mars (Modern Architectural Research Society) not only showed by means of an unusual display technique the vitality of a group of younger architects, but demonstrated their share in the advancement of modern architecture in England.

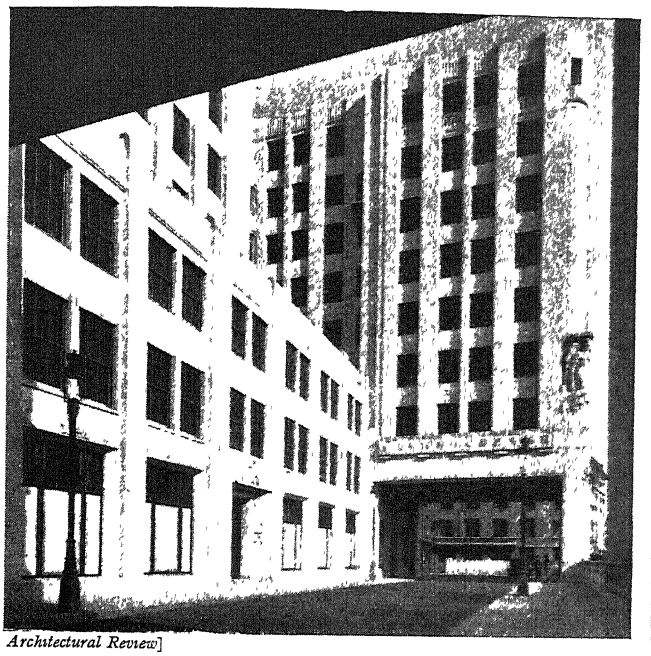
The new and imposing City Hall of Norwich with its neoclassic column treatment is, on the other hand, an example of architecture along traditional lines which is still finding a large appreciative public.

Not unlike England, France has recently completed medical institutions of a size exceeding the American prototypes. (The hospital Louis Pasteur at Colmar has 740 beds, the Beaujon at Clichy 1,100 beds, and the Cité Hospitalière at Lille 4,800 beds. Compare the Cornell Medical Centre in New York, with 1,000 beds.) Terraces often stepping back story after story to give a maximum of sunlight characterize the modern sanatoriums. (*E.g.* Sanatorium Héliothérapique at Vallauris) On the whole French work shows a native fondness for decoration, the use of forms and profiles which have ornamental value, and a general adherence to the principles for proportion and composition laid down by the École des Beaux Arts. The work and momentous writings of Le Corbusier and some other modernists show that there are a few architects living in Paris of a different mind who keep France in the international movement towards a modern architecture.

The decorations for the visit of the King and Queen demonstrate the gaiety and elaborate quality of French design as contrasted to the massive severity of decorations for which German propaganda has become known throughout the world.

Germany is in the process of building projects of a magnitude not seen for centuries on the Continent. They typify the unified and aggressive spirit of the totalitarian state in which organization in the extreme makes gigantic tasks possible. The State is responsible for most work, and even in minor architecture the individuality of the architect is barred from free expression by rigid style control. A national architecture is the result. Many examples of it will go down in history because of their size and solidity. The *Reichsparteitaggelände* of the National Socialist Party in Nuremberg consists of tribunes for reviews, assembly fields for troops and masses of people, avenues for processions, a congress hall for 40,000 spectators with a stage for 2,400 persons (the largest theatre in the United States, at Rockefeller Centre, has 6,500 seats), temporary housing for troops and organizations, a railroad station, and a systematic network of roads. The whole layout stretches over a territory seven kilometres long and three and five-tenths kilometres wide. The recreation buildings and grounds of the organization *Kraft durch Freude* on the island of Rügen (Clemens Klotz, architect) is another gigantically conceived scheme. It consists of vacation dwellings combined with vast squares for festivals, peristyled halls for assemblies, and huge swimming basins. The new airport building at the Tempelhof field in Berlin is another example of a large building, superb in system, orderly but dull in design.

Italy, not unlike Germany, uses architecture for the glorification of the State and the fascist ideal. The competition for the Casa Littoria, at the Foro Mussolini in Rome (by Del Debbio, Foschini e Morpurgo, architects), aimed to establish a national Italian architecture. The design selected fits the character of the Italian people and their Roman ancestry. The massive masonry quality of the building seeks permanence in history Vertical motives of classic proportions are used, and a great solidity is obtained by the dominance of heavy masonry over relatively small openings. In contrast to this still comparatively isolated effort which suggests a return to traditionalism are many excellent examples of sane modern architecture, as for instance the buildings at the airport in Milan (Luigi Giordani, architect), a seashore colony for the fascist youth organization, A.G.I.P., at Cesenatico (by the architect Giuseppe Vaccaro), and several modern schools and kindergartens



Russia has reverted to traditional classicism for its national new architecture. Moscow's " All Union Agricultural Exposition " paradoxically uses porticoes and columns associated with Imperial Rome.

Of the smaller European countries, Finland is dedicated to the functional architectural conception as expressed in the designs of Alvar Aalto. This architect has become known to the western countries by his Finnish Pavilion at the Paris Exhibition, 1937, and the exhibitions of his work in London, Zürich, Milan, and New York.

Sweden has shown a tendency to move from the national romantic and neo-classic styles to the more modern functional architecture, as for example in the Stockholm Buildings Trades Club (S Markelius, architect) and the new market buildings in Stockholm (Hakon Ahlberg, architect).

On the other side of the Atlantic, the United States government has been a large factor in building, and as such a strong influence on maintaining traditional architecture. The Procurement Division of the Treasury Department is at present engaged in the design and execution of an unusually large number of public buildings. All its work follows the academic traditions and classic patterns for public buildings well established over several decades. Through the government's rigid standards for housing design (" Unit Plans " of the United States Housing Authority) and for the design of homes and apartments (Technical Bulletins of the Federal Housing Administration), little opportunity is given to individual architects to depart from traditionalism.

A good many examples of modern residences, schools, and commercial buildings, as in the East, have risen in the south-west of the United States. The fine quality of the work of the modernist, Neutra, has been an important addition to modern architecture throughout the country. Other western architects have been successful in producing

Architectural Review]
UPPER LEVEL OF THE NEW ADELPHI TERRACE, LONDON

interesting variations to the more traditional American forms of residential design. Many European architects of the modern school who have found German nationalism an obstacle to free expression in architecture have entered the United States to teach and practise in the East and Middle West. The influence of such men as Walter Gropius and Mies van der Rohe is beginning to appear in architectural schools and isolated buildings. Greater acclaim has now come, so belatedly, to the work of the American architect, Frank Lloyd Wright, whose exhibition at the Museum of Modern Art in New York in Jan. 1938 showed his genius and versatility. An outstanding recent example of modern domestic architecture in the romantic charm typical of Wright's work is the forest lodge " Falling Water " at Bear Run, Pennsylvania. Wright's new mushroom-shaped concrete columns used at the S. C. Johnson Company Building at Racine, Wisconsin, show the possibility of developing forms which are, at one and the same time, structural and decorative.

The year 1938 saw the group of commercial buildings in New York known as Rockefeller Centre approaching its final stage of development. As it consists of two theatres and eleven office buildings with a total of four and a half million square feet of rentable area and a variety of interlocking attractions to draw the vast public necessary for its success, it expresses the most advanced type of metropolitan architecture. Two large exhibitions have been constructed for 1939—the New York World's Fair " World of To-morrow " and the San Francisco " Golden Gate International Exposition ". The New York Fair follows the modern fashion for exhibition architecture begun in America at the Chicago Exhibition of " A Century of Progress " in 1933. The San Francisco Exhibition rises as a homogeneous grouping of buildings in romantic fantasy.

An interesting controversy between modernism and traditionalism has centred about the classic design for the proposed Jefferson Memorial at Washington, D.C., by the late John R. Pope. This is indicative of the struggle between progressiveness and conservatism which has penetrated from social philosophies into architecture. Construction has, for the present, started on the traditional lines of the original design.

Modern architecture in the United States has not found the fertile ground offered by Mexico, where much has been accomplished in that direction in the last few years.

ARGENTINA, South American republic; language, Spanish; president, Roberto M. Ortiz.

Area and Population. Area 1,079,965 sq. miles; population (1914 census) 7,885,000, official est. (Dec. 31, 1937) 12,761,611, with 76·9 per cent native-born of European stock, 3·2 per cent of mixed blood, 19·9 per cent foreign-born (practically all of them Europeans). Estimates made by German sources in 1938 claim 236,755 Germans and part-Germans in the country. The chief cities, with official estimates of population in 1937, are: Buenos Aires, the capital, 2,415,142 (approximately 3,500,000 with its suburbs); Rosario, 509,604; Córdoba, 309,232, Avellaneda (suburb of Buenos Aires), 233,910; La Plata, 192,225; Santa Fé, 139,175; Tucumán, 136,258; Bahía Blanca, 109,660. Twenty-seven other cities have populations in excess of 25,000.

On Feb. 20, 1938, Dr. Roberto M. Ortiz was formally inaugurated president, succeeding General Augustín P. Justo. President Ortiz, the first " self-made " man ever to be chief executive of Argentina, began a relatively conservative policy outlined in his inaugural declaration against non-American entanglements and for democracy, and urged strengthening of national defences and continued balanced budgets.

The new foreign minister, José María Cantilo, conducted a vigorous foreign policy. Early in the year he made " good will " tours to Chile, Brazil, and Uruguay. Adjustment of a minor boundary dispute with Chile over the Beagle Channel islands (in the far south of the continent) was agreed upon in April, and the controversy submitted to the arbitration of the attorney-general of the United States. Trade treaties were made with Chile, France, and Poland, as well as a barter agreement with Italy, under which Argentine wool and hides were traded for Italian-built oil-tankers. Public opinion in Argentina expressed itself strongly against Germany late in the year, and some efforts to settle Jewish agricultural refugees in Argentina were reported. Sr. Cantilo, however, followed a very restrained policy towards Germany, and at the Pan-American Conference (*q.v.*) at Lima in December led the opposition to a strong stand against totalitarianism. At that conference Argentina insisted upon mild expressions of Pan-American policy.

During 1937 Argentina had experienced her greatest prosperity since 1929, but poor crop conditions for 1938 resulted in a serious decline in production, falling-off of exports, and tightening of credit. The congressional elections on March 5 were generally condemned by the Argentine press as fraudulent, and supplementary elections were held in some districts. The result was an administration majority in congress, so that the government was able to put through its general programme without the difficulties experienced in the previous congress. Because of bad economic conditions some reductions were made in the 1938 budget, and that budget eventually (in November) was continued for 1939. Considerable stress was put on public

DRIVING CATTLE INTO AN ENCLOSURE, ON A RANCH IN MONTE VELÓZ PROVINCE, ARGENTINA

works, which were allotted 159,120,900 pesos, and on June 28 there was created a National Council of Public Works. The new council was entrusted with the co-ordination of activities in the 100 million peso annual public works programme, and is so to regulate construction that it will be increased during periods of depression and diminished during times of prosperity. Agrarian loans increased to 337,315,227 pesos, the highest sum since 1915. Approximately 90 million pesos was spent or obligated for the purchase of armaments during 1938. The Trans-Andine railway was purchased from British interests owning it for £750,000 and a formal offer of £9,500,000 (chiefly in bonds) made for the important Central Córdoba railway. In an effort to aid agricultural prices, restrictions on sugar production were enacted by law.

Education. Education is in the hands of national and provincial governments, with 5,100 elementary schools (enrolment 831,994) under national jurisdiction in 1937. Nearly 250 private and national secondary schools had an enrolment of 36,800. In addition there are various special schools and institutes, including 140 adult schools in Buenos Aires. The five national universities and one private have nearly 25,000 enrolment.

Defence. Argentina has an active army of 30,713 men, and a trained reserve of 448,383. The navy is the largest in South America. Unofficial estimates place the air force at more than 250 aeroplanes. Military or naval service is compulsory.

Finances and Banking. The monetary unit is the paper peso. Owing to the sharp decline in exports during 1938, its value fell to approximately 1*s.* 2*d.* for the official (controlled) and 1*s.* for the free peso.

Trade and Communication. Argentina's foreign trade in 1937 aggregated: exports, 2,452,779,000 pesos, comprising agricultural products, 64·5 per cent (a 34·3 per cent increase over 1936); livestock products, 31·4 per cent; forest products, 2 per cent. Great Britain took 27·8 per cent of the exports, the United States 12·7 per cent, with Belgium, the Netherlands, Germany, Italy, and Brazil following. Imports increased 31·7 per cent to 1,557,684,000 pesos, and comprised textiles, fuel, and lubricants, from Great Britain (18·9 per cent); United States (16·4 per cent); Germany (10·3 per cent), Belgium (6·1 per cent); Italy (5·5 per cent), during the first nine months of 1938, exports declined 44·5 per cent to 1,038,453,969 pesos Imports (totalling 1,058,825,019 pesos) were down 1·8 per cent, the United States leading (18·6 per cent), followed by Great Britain (18·3 per cent) and Germany (10·2 per cent).

Argentina has 25,585 miles of railways. Including the Central Córdoba railway, under government control since Feb. 1, 1938, 32 per cent of the mileage is government-operated. The highway system totals 191,536 miles, including 9,320 miles paved roads; of these 34,029 miles are under national control, but half the national roads are impassable except in the dry season. The national highway programme adopted in 1932 was continued in 1938. This calls for construction of a network of 30,000 miles of improved national highway at government expense, and 600,000 miles of secondary highways by the provinces

Agriculture, Manufactures, Mining. The quebracho, source of tannin, has been extensively developed, with an export value in 1937 of 37,937,000 pesos in extract, and 4,815,000 pesos in logs, representing an increase of 18·7 per cent over 1936, so that Argentina supplies two-thirds of the world output. Argentina produced in 1937 an estimated 60 per cent of the entire world supply of maté (Paraguay tea). The country lacks any great mineral wealth other than petroleum, with an output in 1938 of 18 million barrels (estimate). Manufacturing is developing rapidly, but is in no way adequate to supply domestic needs. About 10·75 per cent of the area of the entire country is under cultivation, while 34·4 per cent is devoted to the pastoral industry.

In 1937–38, the production of principal commodities (in bushels) was approximately: wheat, 184,415,000, linseed, 60,746,428; corn, 161,300,000; oats, 47,368,750, barley, 23,535,416; rye, 3,516,071. Except for oats, which showed a very slight increase, production of all of these commodities was from 25 per cent to over 50 per cent less than in the previous year. Corn, in the export of which Argentina normally leads the world, declined 50·8 per cent.

Cotton production declined somewhat in 1937 and considerably more in 1938, with a sharper decline in its export, due to unfavourable weather, but 1,035,000 acres were planted in 1938. In 1937 sugar production totalled 434,514 metric tons, and that of wine 1,269,000 gallons. Fruits are produced extensively in Mendoza province and elsewhere along the eastern slope of the Andes, and in Patagonia, with an export volume of 64,552,493 lb. in 1937.

In 1936–37 Argentina had a total consumption, domestic and export, of 6,730,581 cattle and 1,434,961 hogs. Wool and hides are important, with an annual production of 170,000 tons of wool and approximately 7,800,000 and 9,600,000 hides and sheep skins respectively.

In 1935 a comprehensive industrial census was taken; its results, made public early in 1938, showed the following: 40,613 industrial establishments, with a personnel of 526,495 labourers and administrative and technical employees, who received 733,985,740 pesos compensation in the year ending June 30, 1935. The value of raw materials used totalled 1,963,224,656 pesos with resulting manufactured goods valued at 3,458,041,607 pesos. Industrial activity was largely in foodstuffs, involving 11,564 establishments, with 120,902 employees, 897,093,422 pesos value of raw materials, and 1,267,118,133 pesos value of finished goods. Of principal importance were the meat-packing houses, which employed 27,663 persons to produce products valued at 440,030,565 pesos. (L. W. Be.)

ARMAMENTS, WORLD: *see* WORLD ARMAMENTS

ARMENIAN S.S.R. The number of districts in this Transcaucasian Republic of the U S S R was increased in 1938 by eleven In June, over 99 per cent of the electorate took part in the elections to the Supreme Council of the Republic, and 156 Communists and 100 non-party candidates were returned. One-quarter of the deputies were women. At the first session of the Supreme Council in Erevan from July 12 to 14, the activities of a number of the Commissariats of the Republic (for Agriculture, Trade, Forestry, etc) were sharply criticized On Jan. 3, eight former leading figures in Armenia were executed for treason after a sensational trial In May, a former Chief of the Armenian Silk Trust was shot for the alleged wrecking of silk production on behalf of the Japanese and Italians, and three further agricultural experts were sentenced to death for sowing bad seeds, disorganizing machine and tractor stations, and taking part in a counter-revolutionary nationalist plot The number of members of the Armenian branch of the Soviet Godless League grew from about 6,000 in 1936 to 37,734 in 1938.

Area and Population :

Area 11,583 sq miles.

Population (1933) 1,109,000 (rural, 845,000 ; urban, 264,000 ; 84·7 per cent Armenians ; 9·8 per cent Turks ; remainder Russians, Georgians, Kurds, etc ; birth-rate (1936) 5 per cent, mortality 1½ per cent).

Leading Cities (1936 populations) · Erevan (the capital) (144,300), Leninakan (formerly Aleksandropol) (73,200), Kirovakan (formerly Karaklis) (15,400).

Economic Life 1937 :

Collective farms, 1,071 ; machine and tractor stations, 24, with 1,323 tractors and 390 lorries ; sown area, 1,078,590 acres (44,478 acres cotton plantations).

Total output of land produce, 3,426,700 centners.

Cotton	(1936)	226,200	centners
Horses	(,,)	48,541	,,
Cattle	(,,)	656,406	,,
Small cattle	(,,)	1,035,597	,,
Pigs	(,,)	64,976	,,

Industry: total 1937 output (prices 1926–27): 216·4 million roubles ; power capacity, over 70,000 kwh. ; output of electric power, 258 million kwh.

Budget (1938) : 388 million roubles.

Cultural Life :

Expenditure on cultural needs (1937) 211·6 million roubles

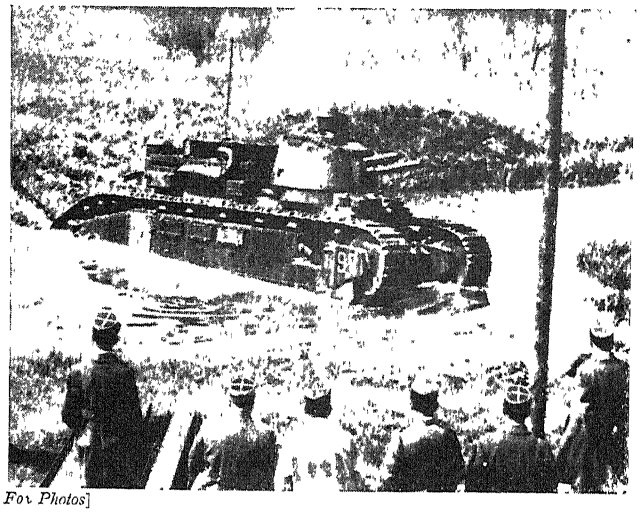
Schools (1936–37) . . 1,200, with 242,000 children

Higher education (1937) : 14 higher educational institutions, 57 technical colleges, 50 research institutes. Total number of students, 17,000.

Miscellaneous :

Illiterates, 7 per cent ; Libraries, 468, with about 1½ million volumes ; Museums, 8 ; Theatres, 17 ; Cinemas, 181 ; Physicians, 711 ; Newspapers published (1936), 66 ; Books published (1936), 649. (S. YAK.)

ARMIES OF THE WORLD. In each country to-day the size of the army, its organization, training, and armament, is being carefully adjusted to the foreign policy which the country concerned is willing to go to war to enforce. The relatively small land forces of the British Empire and the United States, coupled with the absence of conscription, necessitates a defensive policy in foreign affairs. While France has conscription her policy to-day is limited to a defensive one because of the smallness of her population. The defence of her position on the continent of Europe and in North Africa demands an army of a size which can only be raised by conscription. As she must be ready to fight immediately, the necessary efficiency can be obtained only by training all her manhood in peace so that they may be available as trained soldiers the day war comes.

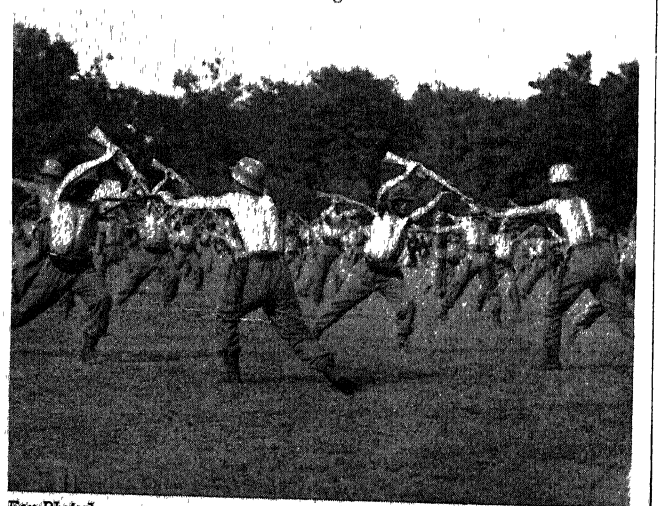


Aeroplanes and Tanks. The two most important questions concerning the proper organization of an army relate to aviation and mechanization. In the panish Civil War several attempts to use tanks alone in mass attacks unsupported by infantry and artillery failed. The largest of these attacks was made with approximately seventy tanks. The habitual method of employment since has been in line, with considerable intervals, supported by artillery fire and infantry.

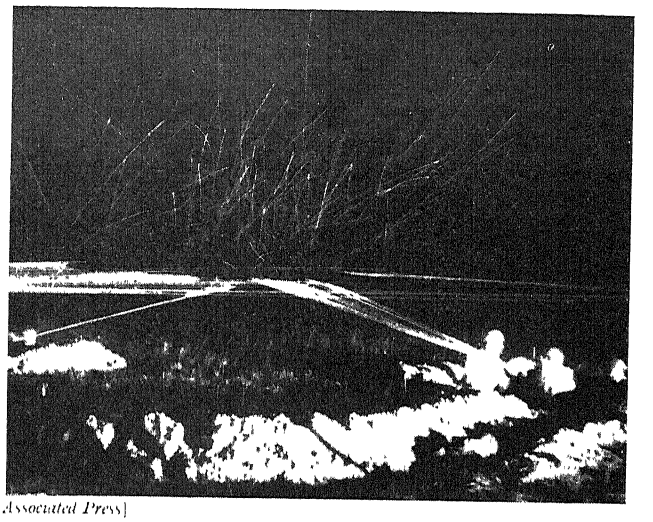
Associated Press]
BLACK STORM TROOPS REVIEWED BY HITLER AT NUREMBERG, SEPT. 11, 1938

The Nationalist Army has habitually used its heavy bombers to continue from the air the preparatory fire after the artillery has finished its preparation. This heavy bombing is immediately succeeded by the assault, aviation making diving attacks with light bombs and machine-gun fire. The infantry assault accompanied by tanks then follows. The war in Spain has shown that light motorized vehicles will not stand the wear and tear of use off the battlefield nor sufficiently resist the enemy's fire upon the battlefield. The consequence is that the latest type of motor vehicles are built to withstand hard usage and enemy's fire despite the correspondent sacrifice of lightness and speed. Yet the horse and the mule, particularly the pack mule have not yet disappeared from the cavalry, field artillery, and the ammunition and supply trains. Experimentation and the Spanish Civil War show that in many terrains and circumstances they are of more use than mechanical transport.

Infantry. The infantry division remains as during the war of 1914-18 the basic unit of all armies to-day. Post-war developments have steadily tended to increase the proportion of automatic weapons and guns of all types. Thus to prevent the infantry division from becoming too cumbersome to be handled as a unit by the commanding general, a reduction in the number of infantry riflemen had to be made. The U.S. Army in the near future will undoubtedly arm every rifleman with a shoulder automatic.



Fox Photos]
A SEVENTY-TON TANK CROSSING A STREAM DURING FRENCH ARMY MANŒUVRES NEAR VERDUN, MAY 1938



This increase in fire power of the individual soldier will permit a reduction in numbers in a unit without reducing the fire power of the unit The increasing use of motor transport to move the division also made a reduction advisable.

Artillery. There are two new tendencies in the artillery armament of to-day One is a tendency to increase the number of light weapons of less calibre than the 3-in. in close support of the infantry, that is, anti-tank guns, anti-aircraft guns, trench mortars, mountain guns, and light howitzers. The other tendency is to evolve guns with mounts which will permit them to be used for more than one purpose: anti-tank guns which can also fire on aeroplanes and anti-aircraft guns which can be used for ground targets too.

Germany is leading in both of these tendencies. The 77-mm. gun which was formerly the main artillery armament of her infantry divisions has disappeared from these divisions. It is still used, however, in the armoured motor divisions. The artillery of a German infantry division to-day is armed with 105-mm. howitzers for close support of the infantry, with its trench mortars and light anti-tank and anti-aircraft guns, and 150-mm. howitzers and 100-mm. guns for more distant support. Germany has to-day an 88-mm. anti-aircraft gun which has been used in Spain not only against aviation but also for fire against trenches and batteries on the ground.

Associated Press]
U S MACHINE-GUNNERS FIRING FROM FOUR POSITIONS WITH TRACER BULLETS, SEEN GLANCING OFF THE TARGET

Mechanized Forces and Cavalry. There are three types of cavalry division to-day: (1) entirely mechanized, (2) mechanized reconnaissance units, with the mass of the division still horsed, and (3) horse divisions. Russia with about 23 horse cavalry divisions has by far the greatest amount of horse cavalry. The Civil War in Spain shows that, except where a continuous line of trenches exists, cavalry mounted on horses still has an important role to play in war. In the Nationalist Army the cavalry mounted on horses, originally of five squadrons, has been raised to over fifty squadrons. Used in conjunction with bombardment and assault aviation, it has produced excellent results in battle and above all in pursuit after battle of defeated infantry, artillery, and tanks. Germany is the leader in having an independent mechanized force directly under the high command, with a "Panzer Corps" of at least two mechanized divisions. Each division consists of 405 tanks, two regiments of motorized infantry in armoured trucks, two motorized artillery regiments, one of 77-mm. guns, the other of 105-mm. howitzers. Russia is reported to have from two to six mechanized divisions in her army. Great Britain has one independent mobile division consisting of two mechanized brigades, one tank brigade, one infantry battalion, and service troops. The Japanese Kwantung army is motorized and mechanized, but the details are secret. France has one light mechanized

(*o*) Air forces separate from Army. (*p*) Urban police.

division (cavalry) and is organizing another. In Italy the mechanized forces are under army unit commanders.

Army and Navy Air Forces. In the United States and Japan, the army and navy each have their own air forces. In other countries the air forces are independent of the army and navy except that in Russia the land forces, air force, and sea forces are all parts of the same organization. The tendency is towards the U.S. and Japanese system as more and more the pilots of independent air forces assigned for duty with the navy remain with the navy. (*See* Air Forces.)

Maginot Line. In France the Maginot Line is to be extended to include the Belgian border in the north and part of the Swiss in the south. The year 1938 saw the construction of a similar line by the Germans, facing the Maginot Line. It is called the Siegfried Line. The Swiss have built a fortified line from Basle to Lake Constance. There are numerous reports that Russia is engaged in constructing fortified lines along her western or European frontier and her eastern Amur river frontier. It is also reported that Rumania plans to build on her Russian and Hungarian frontiers similar fortified lines. (*See* also Air Forces; Munitions of War; Navies of the World; World Armaments.)

ARMY, BRITISH. The British Army comprises several different parts. First comes the Regular, or professional, Army. As voted by parliament, this nominally consists of some 164,000 officers and men, but a further 57,000 stationed in India belong to it, although while serving there their cost is borne, not by the British public, but by the Indian taxpayer. There is the Army Reserve, consisting of men who have returned to civil life after completing their service with the colours, but remain for a further period liable to recall in emergency, to make units up to war-strength on mobilization or fill up gaps caused by casualties in the early stages of war. Its size varies according to the number of men whose colour-service expires at any period, but is at present about 140,000. Then there are the two main sections of the citizen-force proper—the Territorial Army (*q.v.*), numbering over 200,000, and the comparatively new Supplementary Reserve, which is largely composed of technicians and is intended to meet the emergency needs of the Regular Army, at present it has recruited to barely half of its authorized establishment of 56,000. Beyond these is the Officers' Training Corps, formed of a Senior and a Junior Division, whose units are raised in the universities and public schools respectively.

It is a common tendency to speak of Britain's "small army", and the phrase is justified by comparison with the armies of the larger continental powers, especially if only the Regular Army is in mind. But it is worth realizing that the sources which have been enumerated, reckoning in the time-expired Territorials who are still fit for service, provide an available total of not much less than a million trained men. Besides them there are the professional and volunteer forces, both white and native, that are raised in the various overseas territories—in India alone, for example, these total over 200,000 men.

The Regular Army has many points of difference from the armies of the Continent. While they are large, it is small; while they are raised by conscription, it depends on voluntary enlistment; while they have short-service, it has long-service—seven years is the normal; while they are raised from all classes, it is drawn from the poor. But there is also a difference of purpose. The primary object of the Continental armies is the defence of their own country—a euphemism which embraces the attack on neighbouring countries; whereas by contrast the primary duty of the British Army—until a significant change was defined early in 1938—has been, and its largest function still is, the defence and policing of the British Empire. These duties have governed its basic organization. Indeed, in the nineteenth century it became so predominantly a colonial service army as to become quite unfit, both quantitatively and qualitatively, to face the contingency of a European war.

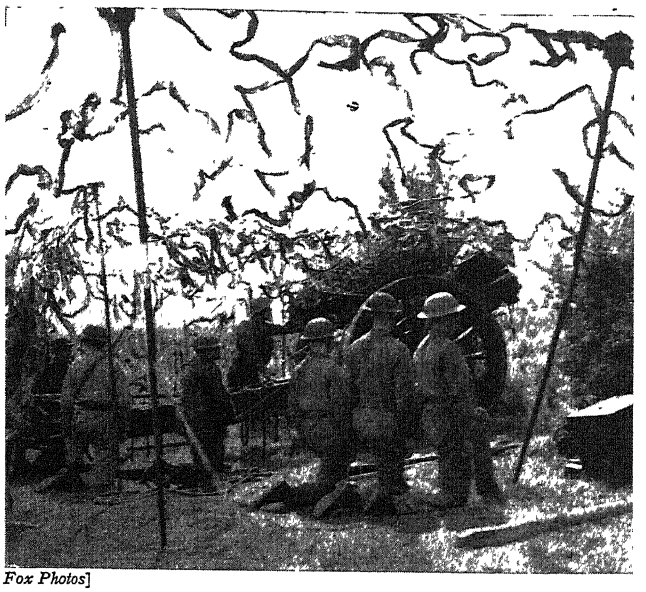
ANTI-TANK WIRE BEING ERECTED DURING A DEMONSTRATION AT ALDERSHOT



Like all institutions, the British Army requires a periodical re-examination to see whether its role has been adapted to the current Imperial policy and to developments in the methods of warfare, and whether its organization and distribution fit its role. The British Army has had a great capacity for improvisation; it has been slower to recognize the necessity for reorganization. During the last hundred years two, and only two, extensive reorganizations have been carried out. The first was by Cardwell seventy years ago. The second was by Haldane thirty-five years later.

Despite the improvement which they brought in many directions, these two reforms fell short of a scientific solution of the problem produced by the evolution of British policy and the evolution of warfare. Following belatedly on European developments, a General Staff had been created, but merely as an additional department. Vested interests hindered a comprehensive reorganization of the Staff, and the fusion in it of the pre-existing departments concerned with personnel and supply.

After the World War, despite all its dearly bought lessons, the reconstitution of the Army was accompanied by no major change in design. It was based merely on a return to the pre-war basis. The question of any thorough re-examination and adjustment seems repeatedly to have been shirked.

A new impetus came in 1937 with the arrival of Mr. Hore-Belisha in the office of Secretary of State for War, and in the following winter the long-delayed re-investigation of the role of the Army was carried out. It produced, in the sphere of organization, a decision to adopt the principle of reducing the size of divisions, and also of units, while increasing their ratio of fire-power to man-power. The divisions were to be of two types—a motorized division, based on the light machine-gun; and a mechanized armoured division, based on the tank. The first type would normally comprise nine battalions instead of the former twelve. The battalions were each to have fifty of the new light machine-guns—the Bren guns—a proportion of which will be borne in armoured carriers. A number of heavy machine-gun battalions were, however, to be retained to serve as corps troops. The artillery were to be reorganized in batteries of twelve guns apiece, instead of six, so that fire-power can be better concentrated and superfluous personnel saved. The artillery are also taking over from the infantry the duty of handling the two-pounder anti-tank gun, although the infantry, in partial compensation, are being given anti-tank rifles of a war pattern.

There have been changes no less great in the strategic conditions which affect the role of the Army. New problems have arisen in each of its possible spheres of employment—for the defence of the home country, the defence of the Empire, and for any operations on the Continent which may be required in fulfilment of obliga-

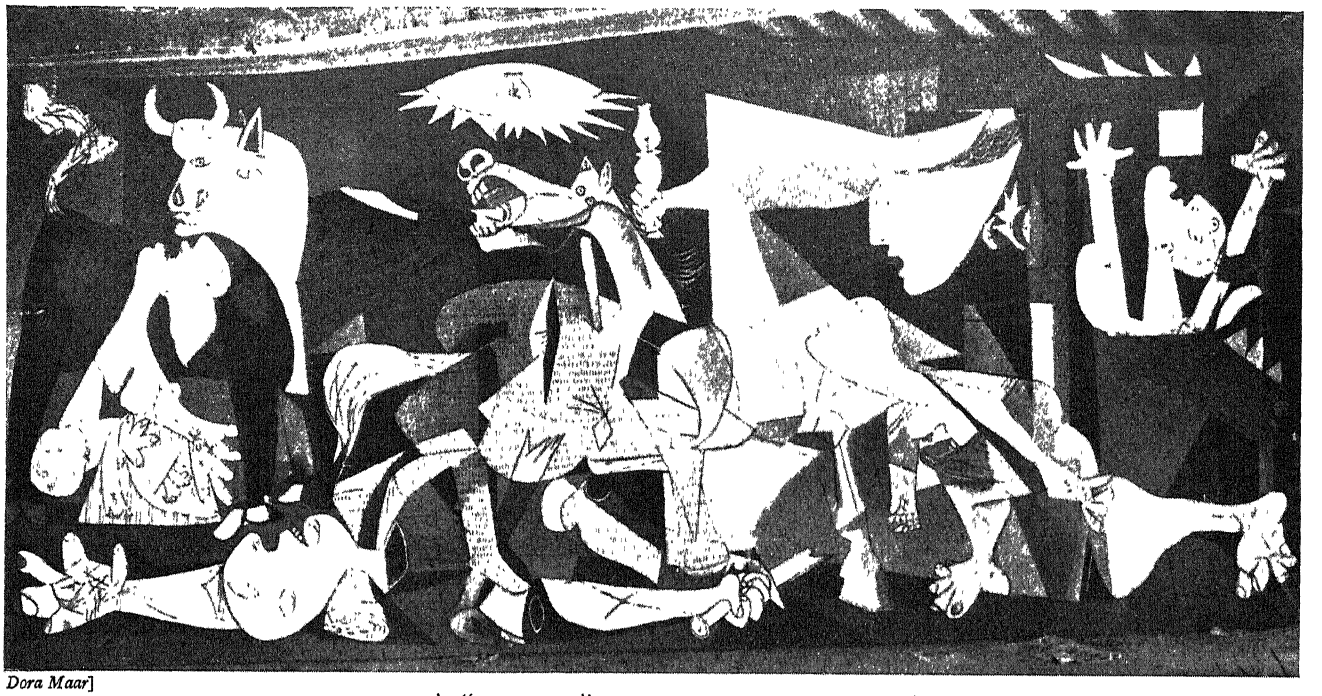
tions. Following this study of the role of the Army in the light of modern conditions, the existing scale of the Regular Army has been taken as adequate subject to some small increases in the technical arms, but the available forces are being reorganized and to some extent redistributed The chief change is that the forces in the Middle East are being reinforced and a local strategic reserve constituted there.

In addition to the organizational reforms outlined in the Secretary of State's speech in March 1938, many improvements were foreshadowed in the conditions of service, training, and equipment. Measures to implement these intended reforms were announced at intervals during the succeeding months, if in some important respects they did not prove to be as full or as rapid as had been hoped. From the infantry in Palestine two additional divisions, the seventh and eighth, have been formed, while a commander and staff have been appointed for a Mobile Division in Egypt, although the implied increase of the few mechanized units already there has not yet been carried out. At home the one mechanized Mobile Division remains as it was, and its reorganization and expansion into two of a handier type is still under discussion; the five infantry divisions have been partially reorganized on a smaller pattern, but the number of them has not yet been increased in fulfilment of the anticipations of last winter; and their announced reconstitution on a completely motorized basis has not taken place. In October, however, it was announced that the field units of the Territorial Army were to be reorganized to provide nine normal-type infantry divisions, three smaller-type motorized divisions, and the components of a mechanized Mobile Division; this implies their eventual provisions with complete modern equipment.



More disappointing, and dangerous, have been the delays in reorganizing and expanding the anti-aircraft forces devoted to the defence of the country. Their deficiencies in equipment were made plain in the September crisis. Fresh assurances, however, have been given of improvement in the supply, while shortly after the crisis a beginning was made with the long-awaited scheme for local defence against the danger of low-flying attack.

In the sphere of internal reform a larger measure of fulfilment has been achieved. The promised improvements in the conditions of service of the men were given effect in the spring, although their effect on the flow of recruits, especially for the infantry, has not been as rapid as could be desired—the shortage is still some 20,000 men. Greater opportunity of promotion has been offered by the creation of a new class of warrant officers as commanders of the minor units. For the officers' prospects a more direct improvement came from the introduction in July of a time-scale for promotion. It brought a list of no less than 2,000 officers—roughly, a third of the subalterns and captains in the Army—promoted in the *Gazette* on Aug. 5. Professional opportunity has been increased by reducing the Staff College course from two years to one, and creating a higher course for the best graduates. (B. H. L H.)

ART EXHIBITIONS. The year 1938 opened with the Exhibition of Seventeenth-century Art in Western Europe at the Royal Academy (Jan. 3–March 12), the first of a projected series devoted to a particular period. At the British Museum a comprehensive show of Drawings and Etchings by Rembrandt occupied the King's Gallery. The Mars (Modern Architectural Research) group gave an instructive exhibition at the New Burlington Galleries. A fine series of early Continental works was shown at the Burlington Fine Arts Club Early in the year A Century of English Caricatures and Customs (1750–1850) was the subject of an exhibition at the Musée des Arts Décoratifs, Paris. In February, at the house of Sir Philip Sassoon in Park Lane, the important exhibition of Old London Arts and Crafts was held in aid of the Northern group of hospitals. An important event was the Exhibition of British Art from Hogarth to the Present Day, opened at the Louvre on March 4, for three months. The exhibition of Contemporary Sculpture, mostly foreign, at the Tate Gallery, aroused a protest from the director in his capacity as adviser to the Customs. In May the Royal Academy featured Coronation pictures, the London Portrait Society had its tenth showing at the New Burlington Galleries, and at the Brighton Galleries were Works in Tempera. At Tooth's (London) Edward Wadsworth's exhibition gave place to Augustus John's West India Pictures, closing June 11. Early English Water Colours were shown at the Fine Art Society; A. J. Munnings, R.A., and the late George Sheringham shared the Leicester Galleries.

Exhibitions were held in June at the following galleries: Barbizon House (The Barbizon School); Matthieson Gallery (A Century of French Drawings from Prudhon to Picasso); Wildenstein's (Women of France in the Eighteenth Century; and Contemporary French Paintings); Sabin's (Fifty Drawings by Rowlandson); Agnew's (Fine Italian and Dutch Pictures); Ifan Kyrle Fletcher's (Gordon Craig's Woodcuts and Drawings); Whitechapel (Contemporary British Art); Leicester Galleries (Paintings by William Nicholson and Paul Nash); Rembrandt Gallery (Paintings by A. S. Hartrick); New Burlington Galleries (Paintings by Beltran-Massés).

The important Exhibition of Modern Silverwork was held at the Goldsmiths' Hall from July 4 to 16. At Reid and Lefevre's The Tragic Painters (Van Gogh, Gauguin, Modigliani, Rouault, Pascin, and Utrillo) were on view. Three Centuries of American Art were illustrated at the Jeu de Paume Museum, Paris. In July also was held an Exhibition of Twentieth-century German Art, mainly by Jewish refugees or German artists proscribed for their unorthodox concepts of art. Other summer displays were a memorial exhibition (pictures and sculpture) by Glyn Philpot, R.A. (Tate Gallery); the third Summer Exhibition

Dora Maar]

PABLO PICASSO'S "GUERNICA", PHOTOGRAPHED IN THE ARTIST'S STUDIO

by members of the Royal Institute, and Sculpture by Despiau at Wildenstein's, pictures and sculpture illustrative of The Dance at the Leicester Galleries; and Drawings and Etchings by Goya at the Victoria and Albert Museum. In the autumn, the Exhibition of Canadian Art was opened at the Tate Gallery, Early British Masters were on view at Agnew's, the Arts and Crafts Society's Jubilee Exhibition was held at the Royal Academy. A representation of the modern École de Paris was given at Reid and Lefevre's, and a selection from Fifty Years of Painting by Sir W. Rothenstein went to the Leicester Galleries. The Fifth Annual Antique Dealers' Fair, at Grosvenor House, opened on Oct. 22 for two weeks. In the same month an important series of Spanish paintings from El Greco to Goya, in aid of sufferers in the Spanish Civil War, was placed at the New Spanish Gallery. In similar cause Picasso's "Guernica" was shown at the New Burlington Galleries. At the close of the year the Royal Society of Oil Painters' show at its Piccadilly headquarters was followed by the 47th exhibition of the Royal Society of Portrait Painters. Marine Paintings, a collection formed by Capt. Bruce S. Ingram, was on loan at the National Maritime Museum.

The principal art event in Italy was the Bimillenary Exhibition in commemoration of Augustus Cæsar, which closed Sept. 23. At the Boymans Museum, Rotterdam, Dec. 25 (1937) till February, was held an Exhibition of works by Pieter Saenredam of Haarlem, painter of churches, and from June to October, Old Master-works of Four Centuries. The Amsterdam Municipal Museum showed French Painting from 1800 to 1900. (H. G. F.)

In the United States there were a number of shows arranged both by museums and dealers devoted to the work of one man or a particular period. Several were in honour of twentieth-century artists: Friesz could be seen at Durand-Ruel; Braque, Oskar Kokoschka, and Ernst Barlach at the Buchholz Gallery; prints by Käthe Kollwitz at the Kleemann Galleries; Picasso at the Valentine Gallery; Henri Matisse at Pierre Matisse's; Juan Gris at Seligmann's; Bonnard and Vuillard and George Grosz at the Art Institute of Chicago; Alexander Calder's mobiles and stabiles at the Smith Art Gallery, Springfield, Massachusetts; a summary of the activities of the Bauhaus (1919–28) at the Museum of Modern Art, New York. Memorial and retrospective exhibitions were held for William Glackens at the Whitney Museum, New York, and for Maurice and Charles Prendergast at the Addison Gallery of American Art, Andover, Massachusetts.

Among the most interesting of the exhibitions devoted to old masters or specific periods were: fifteenth- and sixteenth-century Venetian painting, at Knoedler's and at the Palace of the Legion of Honour in San Francisco; *Italian Gothic and Early Renaissance Sculptures* at Detroit; *French Art of Ten Centuries* at the Morgan Library, New York, *Paintings, Drawings and Prints by the Two Tiepolos* at the Art Institute of Chicago; *Tiepolo and His Contemporaries* at the Metropolitan Museum of Art; Benjamin West at the Pennsylvania Museum of Art, Philadelphia, John Singleton Copley, a bicentenary exhibition, in the Boston Museum of Fine Arts; *Masterpieces of Dutch Painting* at the Museum of the Rhode Island School of Design in Providence; Gros, Géricault, and Delacroix (organized by Knoedler's and seen also at the Art Institute of Chicago); Piero di Cosimo at the Schaeffer Galleries.

There were many exhibitions in the United States and Europe devoted to nineteenth-century French art. The Gangnat Collection of Renoirs (sent to America on indefinite loan) was shown at Philadelphia early in 1938; posters by Toulouse-Lautrec at Marie Harriman's; *Boudin to Cézanne* at Durand-Ruel's; Constantin Guys and *The* 1870's at Carroll Carstairs'.

Five hundred ancient Chinese bronzes from American collections were on display at the Metropolitan; bronzes and ancient Chinese art at Yamanaka and Company; Chinese bronzes lent from the Mrs. E. R. Randon Collection at the Brooklyn Museum of Art. The *Swedish Tercentenary Art Exhibit*, assembled in Sweden, circulated throughout the United States. Contemporary American art was to be seen at Wildenstein's, London. Goyas from private collections and museums in France were exhibited at the Jeu de Paume, Paris. English painting was seen at the Louvre and Persian art at the Bibliotheque Nationale.

The four-hundredth anniversary of the death of Albrecht

Altdorfer was commemorated at the Neue Staatsgalerie, Munich.

In Italy foreign countries participated largely in the twenty-first Venetian Biennial. A special showing of Neapolitan painting (1600–1900) was held in Naples and one of Genoese painting (1600–1800) in Genoa.

ART GALLERIES AND ART MUSEUMS. The centenary of the National Gallery, London, was commemorated in 1938 by the opening of a small additional room intended primarily for temporary exhibitions of works selected from the gallery's own collections. Among the new acquisitions, perhaps the most outstanding are Rembrandt's "Portrait of Saskia as Flora", from the collection of the Duke of Buccleuch, and Van Dyck's "Virgin and Child adored by the Abbé Scaglia", presented by Mr. Anthony de Rothschild. There was a change of direction at the Tate Gallery, London, where Dr. John Rothenstein succeeded Mr. J. B. Manson; and a new room of modern British painting has been opened. At the British Museum the new Parthenon room is reaching completion, and a gallery of Buddhist Art has been arranged. The paintings at Hampton Court have been rearranged and the galleries reopened. Notable among several new provincial museums in Great Britain is that at York Castle where the old female prison has been adapted to house a fine collection of local antiquities formed by Dr. Kirk of Pickering. His gift includes a number of old shop-fronts, mainly from Yorkshire towns, which have been set up in the courtyard. This museum represents a real attempt at a folk museum, illustrating the history of daily life and popular crafts in its own region.

France. The most important new museum opened during 1938 in France is the Musée de l'Homme in Paris. This occupies one wing of the Palais de Chaillot, the new Trocadéro, and contains the French national ethnographical collections, directed by Professor Paul Rivet. Its arrangement is lucid and simple, well planned, and economically achieved. The other wing of the new building houses the Musée de Sculpture Comparée. Reorganization in the Louvre goes on apace; the new arrangement of the sections of applied art and oriental antiquities has now been completed. The evening openings of the excellently illuminated galleries have proved so popular that the extension of the scheme to other museums is contemplated. An important recent bequest to the Louvre is the Walter Gay collection of drawings exhibited last spring in the Musée de l'Orangérie side by side with paintings by Goya from French museums.

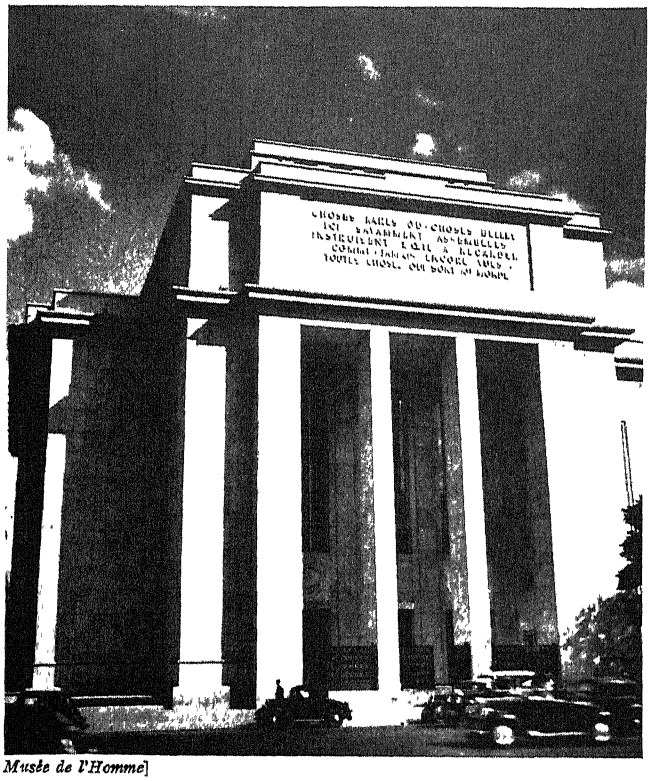
Germany. Political developments in Germany have brought about many changes in the personnel of museum staffs, particularly in Vienna; and the reorganization of collections to illustrate the national and racial principles of the government has been undertaken in many museums. At Saarbrücken the new Saarland Museum was opened in March 1938. It includes the collection of the old Heimat-Museum, enlarged by gifts from the Ministry of Propaganda and other sources. The Schlossmuseum in Berlin has opened two new rooms for German rococo art.

Holland and Belgium. Two particularly fine paintings have recently been acquired by the Museum Boymans at Rotterdam: "Christ at Emmaus" by Vermeer, and "Portrait of a Man" by Rembrandt. Both were discovered by Dr. Bredius. A new Musée Royal des Arts Décoratifs Contemporains has been founded in Brussels by royal decree, and at Antwerp a new Print Room is to be established, in which artists who worked in Antwerp will be represented.

National Gallery]

"PORTRAIT OF SASKIA AS FLORA", BY REMBRANDT

Scandinavia. The house and collections bequeathed to the Swedish nation by the Duchess Hallwyl were opened to the public in Stockholm in May 1938. The Hallwyl Museum presents a typical picture of the home of a cultured Swedish aristocrat of the late nineteenth century. Dr. Paul Nørlund has succeeded Dr. Mackeprang as director of the Danish National Museum in Copenhagen.



Poland. The new building to house the Polish National Museum in Warsaw, which has been in construction since 1927, was opened in 1938. The National Museum, which was founded in 1862, now has 79 exhibition rooms in which to display its extensive collections. A Museum of Old Warsaw is in preparation.

U.S.S.R. The exhibition of the Life and Times of Pushkin held in 1937 has now been put on a permanent footing as the State Pushkin Memorial Museum in Moscow. In Moscow too a Maxim Gorki museum has been opened.

Other Countries. The fine Palestine Archæological Museum was opened in Jan. 1938; a Museu Nacional de Belas Artes, under the direction of Mr. Oswaldo Texeira, has been founded in Rio de Janeiro; and a new building has been erected to hold the treasure of the Imperial Museum of Nara in Japan.

The year was one of steady progress in the museum world, despite the influence of the September crisis, which, in France and England at least, brought new developments to a standstill and the problem of arrangements for the protection of museum treasures in time of war very much to the forefront. Both national and League of Nations committees have been set up to collect and disseminate information about the best protective measures which can be taken.

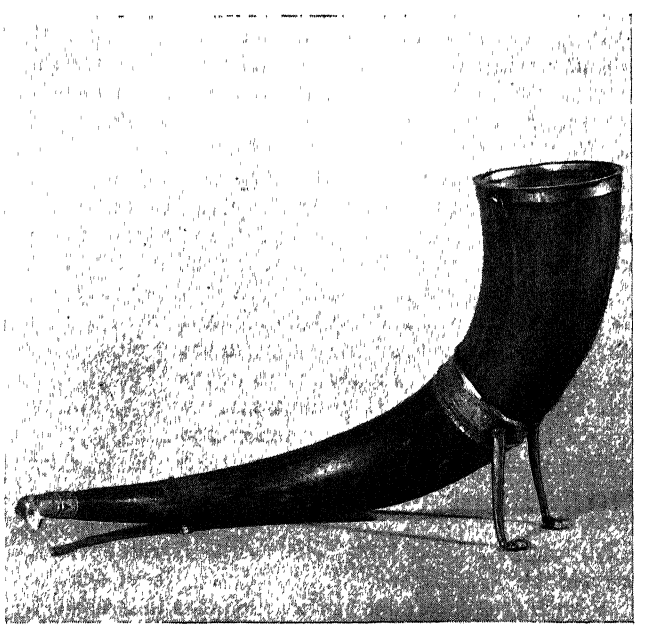
United States. Throughout the United States during 1938 there was considerable building going on to improve existing museum structures and to create new ones: the new building of the Museum of Modern Art in New York is in progress and will be completed in the autumn of 1939, a $1,000,000 five-story building of concrete and glass, with marble facing. The Museum of Modern Art extended its sphere of influence by opening a branch museum in Washington, D.C.

The most outstanding opening of a new museum in the United States was that of the Cloisters, the mediæval branch of the Metropolitan Museum of Art, New York City, on May 14, 1938, in the new building on the summit of Washington Heights, overlooking the Palisades and the Hudson River. There are various departments and collections represented in this building: that assembled by the late George Grey Barnard, purchased by John D. Rockefeller, Jr., in 1925 for the Metropolitan museum; as well as many new superb acquisitions—all gifts of Mr. Rockefeller—such as: Romanesque stone sculpture, stained glass fragments from the Gothic period, two frescoes from an Italian monastery, various doorways, the finest set of fifteenth-century tapestries, an unusual fourteenth-century statue of the Virgin and Child. The land in Fort Tryon Park was also presented by Mr. Rockefeller, with $2,500,000 for the building. The Cloisters contains one of the finest mediæval collections known; cloisters from five French abbeys form the core, with an original chapter house, a modern Gothic chapel, a reconstructed chapel, also eight galleries for exhibitions.

New York University established an institute of fine arts, with the acquisition of the five-story residence of the late Paul M. Warburg at 17 East 80th Street—close to the Metropolitan Museum of Art.



Mrs. William O. Goodman, of Chicago, has made many gifts this year for the advancement of art: her large and splendid collection of pewter was given to the Art Institute of Chicago, and the Goodman Memorial Wing at the Lyme Art Gallery, Old Lyme, Conn., was opened this summer. Likewise the magnificent gift of $150,000 established the William Owen and Erna Sawyer Goodman fund at the Art Institute of Chicago. Mr. Robert Allerton of Chicago gave over $75,000 for the addition of a new wing for decorative arts at the Art Institute of Chicago.

Various colleges and universities in the United States opened new museum buildings to develop the activities of the fine arts departments, in Iowa, Armstrong Hall, at Cornell College, in Mount Vernon, in Ohio, at Oberlin College, the Dudley Peter Allen Memorial museum was added through the generosity of Mrs. F. F. Prentiss of Cleveland, Ohio. Other museums were established in Florida, at Palm Beach; in Delaware, at Wilmington; in Ohio, the Akron Institute opened its new home remodelled for museum use. In the District of Columbia at Washington, the bill for the establishment of the Smithsonian Gallery of Art was passed. The cost of the building, the equipment, and the collection will be sought through private gifts. The site chosen will probably be on the south side of the Mall opposite the National Gallery of Art now under construction.

The Pennsylvania museum was bequeathed $50,000 by the late Arthur H. Lea to change its name to the Philadelphia Museum of Art.

New art museums or art wings are planned for Oxford, Mississippi; Tulsa, Oklahoma; Wilmington, North Carolina; and Williamsburg, Virginia. The competition for an art centre at Wheaton College, Norton, Massachusetts, was decided and the plans are going forward.

The Federal Art Project, Works Progress Administration, made great strides forward in familiarizing the public with its aims through the unusual exhibition held at the Art Institute of Chicago during the summer. Several new art centres were established by the Federal Art Project to carry on the important work of bringing art to the people; the 48th community art centre was established at Sioux

ART SALES. On Feb 1 at Sotheby's two English sale-room records were broken when Durer's "The Great Fortune" (with high-crown water-mark) brought £290 and a second state of Rembrandt's "St. Francis Praying beneath a Tree", £240. At Christie's first important sale (Feb. 7–9), the remaining contents of Norfolk House, St. James's Square, totalled £9,962 10s., two William and Mary mirrors fetching £651 The Norfolk pictures at Christie's rooms on Feb 11 reached £8,733, including an early French triptych (£4,305) On Feb. 25, also at Christie's, 65 pictures were sold for £22,395, of which 53, from the collection of W. B. Chamberlain of Hove, accounted for £12,557, a portrait of Rembrandt's father fetching £7,350 The 31 lots of fine French furniture, tapestry, and objects of art sent by Mrs. George Rasmussen to Christie's on Feb. 24 realized £8,600 At Christie's again, on April 6–7, the French and Italian Renaissance objects of art, sold on the retirement of Mr. George Durlacher, totalled £12,721; and on April 8 a sale of 148 pictures by early masters realized £21,441, including £13,504 from the 65 paintings of the Dutch school acquired by the late Dr. Eduard Beith. On April 26–27 at Sotheby's, the Stephen D. Winkworth porcelain, pottery, and English furniture realized £11,372 15*s* An outstanding sale at Christie's, June 22–25, was the Mortimer Schiff Collection of works of art, furniture, tapestry, sculpture, etc., which totalled £101,948, a record being created at £14,700 for a Rogier Van der Weyden, "The Dream of Pope Sergius". Another important sale at Christie's in June was the Chinese enamelled porcelain acquired by Jakob Goldschmidt of Berlin, 219 lots bringing £24,272. The Chipchase Castle silver obtained £10,713 on June 28 (Christie's). On July 1 Messrs. Christie sold the Denbigh pictures from Newnham Paddox for £19,772, to which the Van Dyck portraits contributed £8,552; and on July 8 they took £15,994 for pictures and drawings from the Brocklebank, Durlacher, and Stanley of Alderley collections.

On Oct. 1 began the ten days' sale at Rufford Abbey conducted by Messrs Knight, Frank & Rutley, in conjunction with Christie's. The works of art accumulated by the Saviles during three centuries produced £25,118. The pictures, which were sent to Christie's in London, realized £40,995 on Nov 17 and 18. An interesting art sale was held at "Formakin", Renfrewshire, where the collections formed by M. J. A. Holms were sold, a Tabriz carpet bringing £3,000. Of the pictures sent to Christie's from Cave Castle, Yorks, on Nov. 25, the principal item, a Ruisdael ferry scene, reached £2,520. The W. R. Hearst collection (second part) of rare early silver from St. Donat's Castle, Wales, sold at Christie's on Dec. 14 for £41,882.

Of Continental sales, among the most important were Old Master Drawings from the fourteenth to the nineteenth century, the property of an Italian collector, conducted early in the year by Weinmüller at Munich; the very extensive and valuable collections of the late Sig Luigi Pisa in September at Venice; and at the end of November the sale of old engravings by Messrs. C. G. Boerner of Leipzig, which brought 100,000 Reichmarks At Amsterdam, also in November, the important collection of Old Masters which belonged to the late A. W. M. Mensing was sold by Messrs. Mensing et Fils. (H. G. F.)

The combined value of art properties dispersed during last season at the three New York art auction galleries was $3,954,593. The largest single sale of strictly art property was the Jay F Carlisle Collection at the Parke-Bernet Galleries with a total of $140,405; and at the Welsh sale at the same galleries a Corot landscape sold for $16,000 as the highest single price for a painting. The largest art sale at American-Anderson was the dispersal of the V. Everit Macy Collection for $114,497.

In Paris, in June, a Fragonard sepia drawing, *Le Verrou*, drew Frs 350,000. The sensation in the modern art field was the collection of A. Pra which resulted in a total at auction of Frs. 2½ millions; two Renoirs—the *Children's Heads* and a *Still Life*—brought Frs 512,000 and 465,000 (these had been estimated at Frs 350,000 each).

ASHANTI: *see* GOLD COAST.

ASHFIELD, ALBERT HENRY STANLEY, 1st Baron Ashfield of Southwell (1874–), British business man, of whom a biographical notice will be found in the *Ency. Brit.*, vol 2, p. 509. Born in Derby and brought up in the United States, where, at 28, he became general superintendent of an important traffic organization, Albert Stanley returned to England in 1907, and within five years was in control of the greater part of London's transport. Knighted in 1914, during the World War Sir Albert entered parliament as president of the Board of Trade, where he effected a complete reorganization; he retired from the government in 1919, was raised to the peerage in Jan. 1920, and in the same year returned to the Underground group of companies as chairman and managing director. In 1931 he was closely connected with the framing of the London Passenger Transport Bill, and on this becoming an Act in 1933 was appointed chairman of the board.

Lord Ashfield went to Canada in 1931 as a member of the Royal Commission to inquire into Canadian transport; he played a leading part in the founding of the Institute of Transport of Great Britain and has been its president, as well as that of many other associations. He is an active member of the Roads Beautifying Association. Lord Ashfield married an American lady in 1904, and has two daughters.

ASSAM, a province of India, consists of two great valleys, the Surma and the Brahmaputra, draining from the north-eastern Himalaya, with the mountain ranges between. It is the home of the Indian tea industry, for which a labour force of nearly a million (including dependants) is imported from other parts of India. In area, rice is the dominating crop. The first complete year of the new constitution was a disturbed one, the ministry having suffered several defeats as a coalition government. In Sept. 1938 it resigned, and a congress ministry replaced it, with Mr. G. N. Bardaloi as premier. Shillong, the capital, is reached by motor road from Ganhati (63 miles), the junction between the Assam–Bengal and Eastern Bengal railways. Attached to the province are the Manipur and Khasi States, the former lying in a beautiful valley (capital Imphal; Maharaja entitled to a salute of eleven guns). The Governor of the province is Sir Robert Reid; he went to Bengal in the summer of 1938, while Lord Brabourne acted as Viceroy. (ME.)

Area and Population (including Manipur):
Area 67,334 sq. miles.
Population (1931) 9,247,857 (Manipur 445,606).
Governor: Sir R. N. Reid, K.C.S.I.
Languages. Bengali (43 per cent), Assamese (21 per cent).
Religions. Hindu (55 per cent), Mohammedan (30 per cent).
Production:

Rice (1937)	5,500,000 acres
Coal (1936)	172,075 tons
Tea (1937)	438,925 acres

Labour :

Number of factories	710
Average daily number of workers employed	47,069

Motor Vehicles Licensed (March 31, 1937): 2,661 cars and taxis, 1,694 commercial vehicles, 90 motor-cycles

ASSASSINATIONS. A list of assassinations, actual or attempted, during 1938 includes :

July 25, Ponce, Puerto Rico. Attempted assassination of Gov. Blanton Winship, who was unhurt The fifteen shots directed at him killed two and wounded more than thirty.

Aug. 25, Jerusalem. British Assistant District Commissioner W. S. Moffatt killed by Arab gunman, whom British troops later shot dead.

Sept. 30, Shanghai Tang Shao-yi, first prime minister of the Chinese republic, assassinated by three assailants in his home.

Oct. 9, Sofia. Maj.-Gen. Yordan Peyev, chief of staff of Bulgarian Army, shot dead by Macedonian terrorist, who killed himself.

Nov 9, Paris. Ernst vom Rath, third secretary of the German Embassy in Paris, died of bullet wounds inflicted Nov. 7 by Herschel Grynszpan, young Polish Jew, in embassy building.

ASTRONOMY. International co-operation has long played an important part in astronomy. Any comprehensive scheme, for example, for charting the sky can be completed in reasonable time only if a number of observatories in both hemispheres participate; a continuous record of, say, solar activity or a nova outburst requires the co-operation of a chain of observatories round the world. Further, to ensure homogeneity of data, co-operating astronomers must agree upon standards of reference and methods of reduction. These ends are now served by the International Astronomical Union, which in 1938 held in Stockholm its sixth triennial general assembly. It adopted important resolutions on such matters, and received reports of progress in various branches of astronomy from the thirty-odd commissions which carry on its work between the assemblies.

Solar System. *The Sun.* Astronomers at Stockholm were enthusiastic about motion pictures of solar prominences made by Lyot (*see* illustration). The McMath-Hulbert films mentioned last year (*Ency. Brit. Book of the Year*, 1938, p. 67, quoted as A), were produced with the aid of a spectroheliograph; Lyot's are *direct* photographs through filters, taken by devices like those he used in photographing the corona (*see* A). The phenomena revealed by both methods are impressive; sometimes a prominence is seen first as a cloud floating some 100,000 km. above the solar limb, then luminous matter pours down from it, seemingly drawn into a centre of attraction on the surface; one of Lyot's films, however, shows such a cloud dispersed by an uprush of further material from the Sun.

Auroras visible over unusually wide areas were symptomatic of the very "active" state of the Sun in the early months of 1938. The great display on the night of Jan. 25–26 was seen over nearly all Europe; great displays were seen in Canada on the nights Jan. 24–25 and 25–26, and in the southern hemisphere about the same time. The magnetic storms associated with these displays, and with one on April 16, were more intense than any recorded (by Greenwich) since 1909.

Such effects belong to a set of solar-terrestrial relationships of which the facts are briefly: a general accordance between the frequency of magnetic storms and the intensity

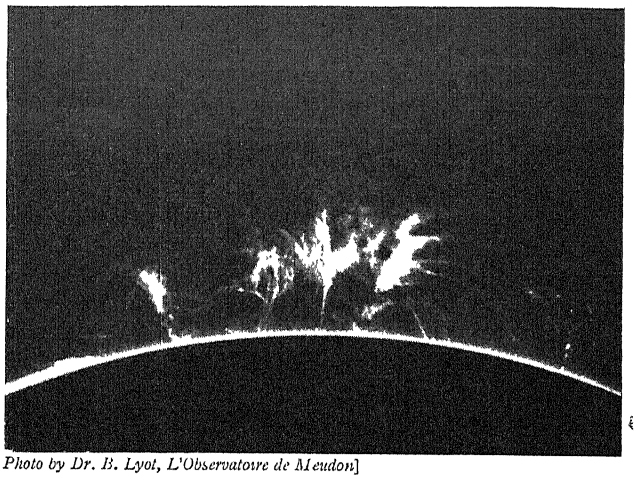

Photo by Dr. B. Lyot, L'Observatoire de Meudon]

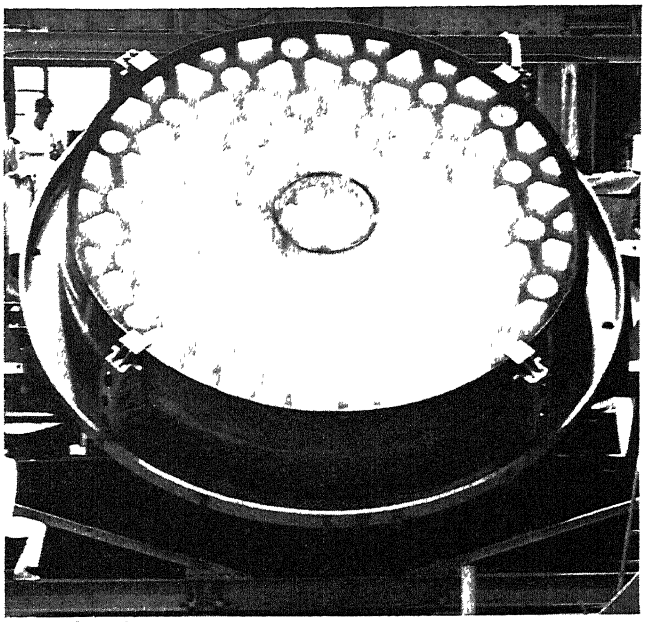
SOLAR PROMINENCE OF JUNE 12, 1937. FROM CINEMATOGRAPH FILM MADE BY DR B. LYOT; DIRECT PHOTOGRAPH MADE WITHOUT SOLAR ECLIPSE THROUGH A RED FILTER, EXPOSURE $\frac{1}{10}$ SEC.; SUN MASKED BY METAL DISC

of solar activity, a tendency for auroras and "lesser" magnetic storms to recur at intervals of about 27 days (the solar rotation-period), a tendency for a "great" magnetic storm and an associated aurora to occur between one and two days after the central meridian passage of a large sun-spot. These are well explained (on Störmer's theory of auroras and Chapman's of magnetic storms) on the hypothesis of the radial ejection from disturbed localities on the Sun of streams of charged particles, moving about 1,000 km./sec. which, when near the Earth, move in paths determined by its magnetic field.

This hypothesis receives new support from the discovery by Hess, Steinmaurer, and Demmelmair of a correlation between fluctuations of the Earth's field and the ionization produced by cosmic rays, the effect being very pronounced Jan. 16–28. This can be explained by noting that the particle stream which on Chapman's theory modifies the field at the Earth's surface must modify it also at considerable distances, and so deflect the cosmic-ray particles from their normal paths. Again, the average lower limit of auroras is near the E-layer of the ionosphere; the entry into this layer of high-speed particles producing auroras must increase its ionization, and will presumably affect radio transmission. This effect has now been detected. It differs from radio fade-outs, associated with bright solar eruptions (*see* A), and ascribed to ultra-violet radiation. But it is extremely interesting that Higgs and Giovanelli in Australia observed a prolonged solar eruption, associated with radio fade-outs, some 35 to 39 hours before the aurora of Jan. 25 They suggest that the particles causing the aurora came from the same solar disturbance; there was in this instance no great spot on the disc.

Planetary System. On Oct. 30, 1937, the minor planet Hermes approached to within a distance of 485,000 miles from the Earth, which is closer than any astronomical object (except the Moon) has ever been known to come. It was discovered and named by Reinmuth at Heidelberg, and subsequently identified on plates taken at other observatories. The whole series, however, covers less than five days, the difficulty of observation being due to its rapid motion across the sky, which at the time of discovery was of about 100 times the usual order for such objects. Hermes is probably less than a mile in diameter. The observation of such a small rapidly moving object is largely a matter of chance, and it may never be seen again.



Two new satellites of Jupiter (JX and JXI) have been discovered by Nicholson at Mt. Wilson Both are extremely faint. JX was observed July 6–Aug. 25, when it was about 7,000,000 miles from Jupiter, but very diverse orbits have been inferred from the positions, JXI was observed July 30–Aug. 25 and was at least 10,000,000 miles from Jupiter.

Spencer Jones has analysed the Greenwich latitude variation observations for 25 years (1911–36), for the determination of the constant of nutation, an important constant in fundamental astronomy. It measures the "nodding" of the celestial pole towards and from the pole of the ecliptic caused by the motion of the Moon's nodes. His value $9''{\cdot}217 \pm 0''{\cdot}004$ yields 81·53 for the ratio of the Earth's mass to the Moon's (or 81·59 allowing for galactic rotation)

The problem of the origin of the solar system attracts renewed interest. In order to explain its large angular momentum Lyttleton and Russell independently proposed recently the hypothesis that the Sun was initially a binary star, and that another star collided with the Sun's companion, knocking it out of its orbit and leaving behind merely "débris" of the collision as material for planet formation Lyttleton now further suggests that this material first formed a few large planets, rotating rapidly in virtue of the shearing action of the collision. As each of these planets cooled and contracted, its rotation would produce fission into two main masses, with again some débris not absorbed into either. The main components are identified as present major planets, while the débris is supposed to have formed their satellites as well as the "terrestrial" planets, and probably the Moon. It is a complicated story; but it seems impossible otherwise to account for the existence of bodies of as low masses as the planets (had they been formed directly out of stellar material they would have "evaporated" instead of condensing) and for known disparities in their densities.

Stars. *Special Stars and Stellar Structure.* The past year has seen the discovery of the largest known diameter of a star, the principal component (I) of ϵ Aurigæ is found to have a diameter about 3,000 times that of the Sun. Surprisingly, component I cannot be seen directly, for it is an infra-red star, but its characteristics are revealed when it eclipses its companion (type F2).

There has also been a new claimant for the title of "nearest star". It was the twelfth magnitude star Wolf 424, and its claim was deduced from a spectrum of this faint object, which Yerkes observers succeeded in obtaining. However, a subsequently announced trigonometric parallax has disposed of this claim, but not of the interest of the spectrum. For Wolf 424 is an M-dwarf, and what is important is that it belongs to a class of star which may be the commonest of all. Such stars can be seen only if they are relatively close; Luyten finds that amongst the 54 known stars nearer than five parsecs, the maximum abundance occurs at absolute photographic magnitude about + 15, while various recent studies by van Maanen put it about + 12. Thus the most abundant stars are probably 1,000 to 10,000 times fainter (intrinsically) than the Sun. Complementary results on the frequency of spectral types emerge from the now nearly complete Spectral Durchmusterung of faint stars in the Kapteyn selected areas. Amongst bright stars early types are relatively abundant, but amongst these fainter stars later types, especially G, preponderate. However, this Durchmusterung does not include the very faint stars just discussed.

THE 200-IN. DISC FOR MT. PALOMAR OBSERVATORY TELESCOPE NEARING COMPLETION AT PASADENA, CALIFORNIA

About ten years ago Russell, Adams, and Moore calibrated the multiplet intensities in the solar spectrum, and there followed Russell's extensive analysis of the composition of the solar atmosphere. Hacker's study in 1938 of the Arcturus spectrum represents the first extension of such work to another star. He finds Arcturus's atmosphere to have effective photospheric temperature $3925° \pm 75°$ K. and mean electron pressure $3{\cdot}9 \times 10^{-8}$ atmosphere.

The spherical form of a star is distorted by rotation and by tidal action of a companion. The degree of distortion depends in a known way upon the degree of concentration of density towards the centre. Therefore, measurements of the distortion can be used to test theories of internal stellar constitution. The distortion is in principle deducible from the apsidal motion of a double star, but the method is difficult of application. It can, however, be got successfully from light-curves of eclipsing binaries. For example, μ^1 Scorpii in 1938 has been found to have components, one with major axis 6.22 and minor axis 5·51 solar diameters, the other with 5·60 and 4·95. This is novel, because generally only the mean ellipticity of the components can be inferred. Studies of thirty or forty such cases lead Luyten to deduce for the stars concerned a central condensation about the same as for the planet Saturn, and Kopal to conclude that main sequence stars are more nearly homogeneous than theories of their constitution had predicted.

Stellar System. A few examples of newly published additions to systematic astronomy are 28 new parallaxes determined at Greenwich and 85 at the Cape of Good Hope (including new values for Sirius, Canopus, and Antares) and a list of 800 new southern double stars by Rossiter. It may be mentioned that from 1926 to 1937 parallaxes of 836 stars, involving the measurement of 3,476 plates, were published by the Cape Observatory. Jackson gives also (1938) an analysis of the distribution of 41,000 stars in the Cape Astrographic Zone with respect to photographic magnitude, spectral type, and proper motion, with estimates of the proportion of dwarfs and giants and of space densities of various classes of stars.

Oort publishes new conclusions about the structure of the Galaxy. It was stated in A that our galaxy probably resembles the spiral nebula there illustrated Oort claims to have derived fresh data concerning the location of spiral arms, which also show the Sun to be in one of the emptier regions between the convolutions Much work is required to establish and extend such results; coupled with results on motions in the galaxy, they should lead to far-reaching conclusions about its evolution.

Hitherto only two types of large-scale stellar aggregates have been recognized, globular clusters and extragalactic nebulæ. But now Shapley has found another. The examples found are one in Sculptor and one in Fornax, and Shapley considers that they probably belong to our own "super-galaxy", and that the super-galaxy in Virgo probably contains similar systems. Such a system is distinguished from a globular cluster by its low surface brightness, which has probably prevented their discovery in greater numbers, and from extragalactic nebulæ by the apparent absence of Cepheids, supergiants, irregular nebulæ, and sub-clusters. However, they are being searched for Cepheids in order to determine distances.

Extragalactic Nebulæ. It was said in A that, to a first approximation, the galaxies show a statistically uniform distribution throughout the space accessible to existing telescopes. Two new surveys by Shapley, one involving about 76,000 and the other 97,000 galaxies in the southern galactic hemisphere, confirm his previous contention from comparison of the two galactic hemispheres that, on the contrary, there are remarkable *anisotropies* in the distribution to a depth of about 10^8 light years. He considers that these vitiate attempts that have been made to show contradictions between the conception of the "expanding universe" and the evidence of nebular counts, since by assuming isotopy they were evidently based on too bold extrapolations from limited regions of the sky.

Telescopes and Instruments. Four great telescopes in course of construction are described in *Ency. Brit. Book of the Year*, 1938, p. 632. As regards these, satisfactory progress is reported in the work at Pasadena of figuring the 200-in. disk for the Mt. Palomar Observatory. Also a third attempt in America to cast a pyrex disk for the 74-in. reflector of the new Radcliffe Observatory at Pretoria has proved successful; it is being figured in England. The erection at Pretoria of the turret, and the telescopic mounting illustrated in 1938, is now nearly complete. The 24-in. photographic refracting telescope from the old Radcliffe Observatory at Oxford has now been re-erected at the London University Observatory.

Important advances in time-keeping are likely to result from the use of quartz clocks, whose working depends upon the piezo-electric vibrations of quartz crystals in alternating electric fields. These clocks equal the performance of the best pendulum clocks over long periods, and are better over periods up to some months. They can be compared more accurately, and proximity is not essential for this; standards throughout the world can be compared with an accuracy of 0·001 sec. per day.

A noteworthy advance in astrophysical spectroscopy is the adoption of diffraction gratings ruled by a new technique developed by R. W. Wood. The ruling is on aluminized pyrex glass, and can be made to concentrate a large percentage of the incident light into the spectrum of any desired order; the concentration of 85 per cent in the first order spectrum is possible Such gratings are in use at Mt Wilson in the spectrograph of the 100-in. telescope, and at Harvard Observatory (W. H. McC)

ATATURK, KAMÂL (1881–1938), first president of the Turkish Republic, was born in humble circumstances in Salonica, and, in 1904, by way of the military preparatory school, entered the army as lieutenant An account of his career and astonishing rise to pre-eminence will be found in the *Ency Brit.*, vol 16, pp. 31–32

Associated Press]
KAMÂL ATATURK

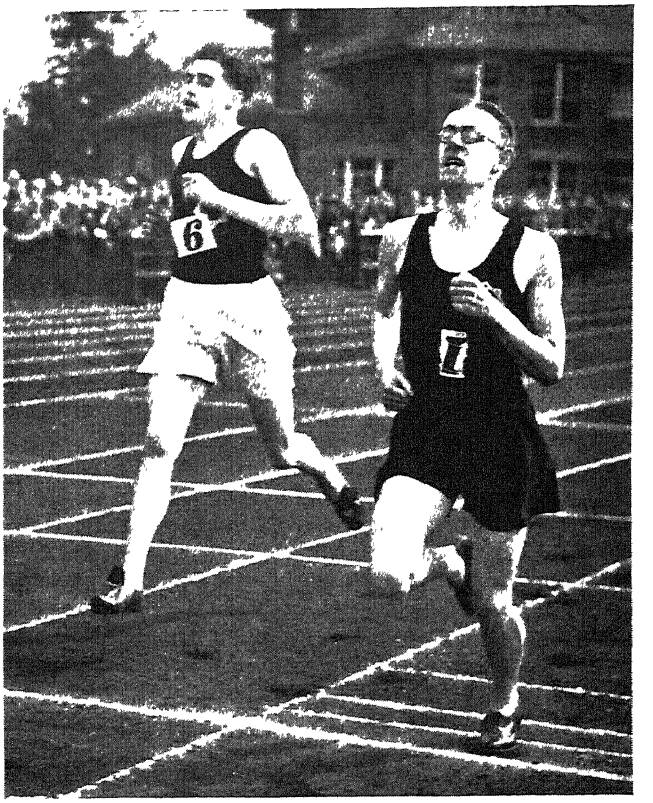
During his last ten years the president, who was re-elected in 1931 and 1935, retained his dictatorial powers and his fierce anti-clerical and anti-Moslem prejudices, and continued the secularization and modernization of his country, holding that Turkey could not compete with the modern world unless she were modern also. Towards this end he took an active part in the change-over from the Arabic to the Latin script, himself (1931) teaching the new alphabet all over the country; and it was as part of the same campaign that, on ordering all Turks to adopt surnames (1934), he took that of Ataturk ("Father of the Turks"), dropped the Arabic "Mustafa", and respelled "Kemal" "Kamâl". His public acts belong to the history of Turkey (*q v.*); the facts of his private life are known to few. At times a hard drinker, an inveterate card-player, and always an indefatigable worker, he is said to have cared for only one woman—his mother, for one man—his successor, President Ismet Inonü (*q.v.*), and for one thing—the good of his people. He married Latifé Hanum, daughter of a wealthy Moslem shipowner of Izmir (Smyrna), in 1923, but divorced her (having had no children) in 1927, fearing that she might attempt to influence policy. The profits accruing from his great development of the State's resources he put back into the development of the State; and when he died of cirrhosis of the liver, on Nov. 10, 1938, the government felt able to announce that "Turkish youth will march along the path Atatürk traced; Kamâl Atatürk will live for ever". He was given the greatest public funeral that Turkey had ever known on Nov. 21, at Ankara, Field-Marshal Lord Birdwood, his former opponent at Gallipoli, representing H M. King George VI. (L. H. D.)

ATHLETICS. Outstanding features of 1938 were the British Empire Games at Sydney, Australia, in March, and the European Championships at Paris in September. The Empire Games were remarkable for an improved standard of performance, one world's, three Empire, and ten Games records being broken. The best performances were: T. P. Lavery (South Africa), 120 yds. hurdles, 14 sec.; C. B. Holmes (England), 100 yds., 9·7 sec., and 220 yds., 21·2 sec.; C. H. Mathews (New Zealand), 3 miles, 13 min. 59·6 sec., and 6 miles, 30 min. 14·5 sec.; T. Loaring (Canada), 440 yds. hurdles, 52·9 sec. None the less, the Empire Games had an adverse effect upon the part played subsequently at European meetings by British athletes,

who suffered from the long voyage and indifferent conditions obtaining in Sydney

The only member of the team to retain his title at the English Indoor Championships was F. R Webster, R A., who won the pole vault for the fourth successive year and later made a new English record of 12 ft. 9½ in New records were set up at the Indoor Championships by D O Finlay, R A F., 70 yds hurdles, 8·9 sec.; and R. Thorogood, 2 miles, 9 min. 33·6 sec.

The British Games on Whit-Monday again catered for the inter-county championships, in which Surrey finished ahead of Middlesex, Lancashire, and Hertfordshire. New records were made by W E N. Breach, long jump, 23 ft. 4½ in , C. B Holmes, 100 yds., 10 sec.; D. O. Finlay, 120 yds hurdles, 14 9 sec.; and a new English record by J Higginson, hop, step, and jump, 47 ft. 4 in.



A new scoring system was adopted for the Oxford and Cambridge Sports, in which points were awarded for the first three places. This resulted in a win for Oxford by 60 points to 57 points. The match, in which the Universities of Oxford and Cambridge met Princeton and Cornell, brought an unpleasant surprise for the British, who lost to the Americans by 9 events to 3. There were no outstanding performances.

National Championships in Great Britain produced satisfactory results with an outstanding field events performance by D. Young, who won the Scottish discus title at 153 ft. 10 in. The 69th A.A.A. Championships produced records from D. O. Finlay, who, in winning his seventh consecutive hurdles title, returned 14·4 sec., and Maffei (Italy), long jump, 24 ft. 8 in. Of the 21 events, six went to Italy, two to Holland, two to Eire, and one each to Northern Ireland, Belgium, and South Africa. The Italian team were successful in the six miles, pole vault, shot, discus, long jump, and sprint relay.

Perhaps the main reason for the brilliant progress of Germany was to be found in the number of International matches in which German teams took part and triumphed. Germany defeated Poland, 105–73; France 105–46; Switzerland, 108–50; Holland, 57–40; and also Denmark. Britain, however, had her triumphs, defeating Norway, 72–67, and France, 70–50. The All-British Triangular International was revived, with England (84½ points) beating Ireland (44½) and Scotland (22). The match was unsatisfactory through the exclusion of a number of field events. No less than eighteen nations competed at the British International Festival on August Bank Holiday, when new British records were made by S. C. Wooderson, 880 yds., 1 min. 50·9 sec.; A. G. K. Brown, 440 yds., 47·6 sec.; J. Patterson (U.S.A.), 440 yds. hurdles, 53 sec.; and A. Varszegi (Hungary), javelin, 237 ft. 2¾ in.

Germany scored a major triumph in the European Championships, which provided a fitting climax to a great season. It is only fair to say, however, that Great Britain, but for the trip to Australia, must have succeeded. As it was, a skeleton British team scored points in all but three of the fifteen events in which Great Britain was represented. The all-round ability of Germany, an unaccountable falling off in the running of the Finns, and the deplorable weakness of Great Britain in the field events is revealed by the scoring: Germany, track 54, field 49; Finland, track 37, field 41; Great Britain, track 52, field 1½.

The institution of the School of Athletics at Loughborough College, England, is, however, rapidly remedying British field events weakness and eliminating the need to rely upon foreign coaches.

Keystone]

S. C. WOODERSON (RIGHT) SETTING UP A NEW WORLD'S RECORD FOR THE HALF-MILE AT MOTSPUR PARK, AUG. 20, 1938

Other matters of moment during the year have been the opening of the White House of Finnish Sport at Vierumäki, Finland, much on the lines of the English School, and the necessary improvement of the stadium at Helsingfors in which the next Olympic Games will be held in 1940.

Outstanding performances during the European year have been achieved with world's records by S. C. Wooderson, 880 yds., in 1 min. 49·2 sec., and 1 mile in 4 min. 6·4 sec.; Y. Nikkanen, javelin, 258 ft. 2½ in.; the Germans, Hein (191 ft. 4½ in.) and Blask (193 ft. 6·8 in.) in the hammer; and 10,000 metres, Maki (Finland), 30 min. 2 sec. The following performances by British athletes, other than Wooderson and Finlay, deserve mention: Brown, 440 yds. in 47·6 sec.; Webster, pole vault of 12 ft. 9½ in.; Higginson, hop, step, and jump of 47 ft. 4 in.; Emery, 2 miles in 9 min. 7·6 sec.; Young, discus throw of 153 ft. 10 in.; and Blakeway, javelin, 202 ft. 4 in.

Germany, however, overshadowed Europe. In addition to her two world's record-breaking hammer throwers, Suter cleared 13 ft. 3 in. for his European pole-vault title; Harbig ran 400 metres in 47 sec. and 800 metres in 1 min. 50·6 sec.; Wegener did the 110 metres hurdles in 14·5 sec.; Leichum a long jump of 25 ft. 1¼ in.; Woellke a shot put of 54 ft. 2½ in.; while Sievert was the best Decathlon man in Europe, with 7,467 points.

Walking activities did not attract quite as much attention in Europe during 1938 as previously owing to the doubt existing as to what new rule, if any, should be adopted to define fair walking and what should constitute the walking events at the next Olympic Games. After a conference in Italy the matter of the definition remained *in status quo*, but the Olympic position was decided. For some time it was the custom to hold 3,000 and 10,000 metres track walking races, but in 1932 and 1936 Olympic walking was confined to a 50-km. road walking championship, won on

both occasions by British walkers. In future, one of the short track walks is to be restored to the programme, a matter of great satisfaction to Italy, who, through Friggerio, have figured successfully in this event. None the less, during 1938 pride of place at the official Olympic walking distance of 50 km went to France, with Cambrai returning 4 hr. 35 min 25 sec , and Bussière 4 hr 36 min 35 sec. After the Frenchmen in the rankings came Zofka, Czechoslovakia, and Sergerstrom, Sweden, and then Whitlock, Great Britain, the Olympic Champion (4 hr. 41 min. 51 sec.).

In another road event, the marathon race, the world ranking list is headed by Coleman, South Africa, who in returning 2 hr 30 min. 49 sec. for the run of 26 miles 385 yds., was nearly 5 minutes ahead of the next best time returned by Pawsan, U.S A , who was himself some 4 seconds faster than Ragazos, Greece.

An event not universally contested, and earlier an almost exclusively British preserve, is the 3,000 metres steeplechase. No British athlete is included in either the world's or European rankings for 1938. Major honours are shared by Scandinavians and Germans, with Linblad, Sweden, returning 9 min 9·2 sec. and his fellow countryman Larsson 9 min. 10·8 sec. This is a complete change of leadership since British supremacy passed in the first place to Finland and has now gone to Sweden. (F. A. M. W.)

United States. Fifty-seven records were broken by American athletes in 1938. Sixty-five American athletes were invited to compete in European countries during the summer of 1938, and they won the dual meet with Germany in the Berlin stadium and created new foreign records in London, Paris, and elsewhere.

Most significant of all the new figures for the year is the 4 min. 4·4 sec. mile run by Glenn Cunningham, the greatest mile that man has ever run. The new record, made on the fast indoor track at Dartmouth College, Hanover, N.H., on March 3, will not gain acceptance by the International Amateur Athletic Federation (even though it does pass into the A.A.U. American list), because the federation does not recognize indoor records.

The only American track record that will be advanced by the I.A.A.F. will be the 440-yd. relay of 40·5 sec. made by the University of Southern California quartet in May 1938, which may replace the world record of 40·8 sec. made by another team of the same institution in 1931. Ben Johnson, sprinter of Columbia University, broke eight track records during 1938.

A total of 77 amendments to the constitution, by-laws, and rules of the A.A.U. was presented to the delegates during the fiftieth anniversary convention of that organization, at Washington, D.C., Dec. 2–4. For the fourth consecutive year, opponents of the metric system for measuring distances of track events attempted to return to yards and miles. Metres are used only in the national indoor and outdoor championships for track events, not in field events.

Other changes of the A.A.U. affecting track and field are those permitting the use of starting blocks and establishing minimum distances for runways of field events, for which the I.A.A.F. gave its approval in February. Blocks have been used in A.A.U. competitions for the past year.

At the outdoor national A.A.U. championships, held in Buffalo Civic stadium, Buffalo, N.Y., July 2–3, the track was very heavy, and the only record set up was by Hank Cieman, of the Achilles Club of Toronto, in the 3,000-metre walk, 13 min. 39·9 sec. The championship team title was won by the New York Athletic Club with 57 points.

In the outdoor intercollegiates, at Randall's Island, N.Y , on June 4, the track and field team of the University of Southern California captured the team title for the eighth time, with 47½ points, double those of Michigan State College, 24 points Even though the meet was held during a heavy rain, three new records were established : Howard Borck, Manhattan, 1 mile, 4 min. 13·9 sec. ; Joe Mochair, Manhattan, 2 miles, 9 min 21·2 sec. ; Dolos Thurbar, of U S A , high jump, 6 ft. 6⅝ in.

ATHLETICS, WOMEN IN. The main features of the women's athletic year, 1938, were the British Empire Games at Sydney in March, and the European Championships at Vienna in September

At the British Empire Games D Norman, Australia, performed a remarkable feat in winning the 100 yds. in 11·1 sec (Empire record), 220 yds in 24·7 sec. (Games record), long jump with 19 ft. 0¼ in. (Games record), as well as representing Australia's winning team in the 440 yds. relay, run in 49·1 sec. (Games record). Records for the Games were broken also by B. Burke, England (80 metres hurdles, 11·7 sec.), D. Odam, England (high jump, 5 ft. 3 in.), and R. Higgins, Canada (javelin, 125 ft. 7¼ in.).

The principal scores in the European Championships were Germany 96 points, Poland 29, Holland 18, England 15, Italy 11, and Hungary 8. In the high jump Dora Ratjen, Germany, achieved a wonderful world's record of 5 ft. 7 in., beating F. Csak, Hungary, the Olympic Champion, who tied with two other girls at 5 ft. 4·6 in. for second place. The famous Polish girl, Stella Walasiewicz, won the 100 metres in 11·9 sec. and the 200 metres in 23·8 sec., defeating K. Krauz, Germany, in both races ; and was second, at 19 ft. 0·7 in., in the long jump to I. Praez, Germany, who jumped 19 ft. 3·4 in.

The English Women's Open Championships were noteworthy for B. Reid breaking two British records, *i.e.* shot, 38 ft. 0½ in., and discus, 116 ft. 2 in. ; while B. Locke equalled the British record of 7·6 sec. for 60 metres, and also won the 100 metres in 12·2 sec. (F. A. M. W.)

In America the women's outdoor track and field championships of the A.A.U., held in New Haven, Conn., on Aug. 7, saw six new champions appear among the eleven events on the programme. The Tuskegee Institute, of Alabama, successfully defended its team title, winning thirty points to thirteen points, for the German-American A.C., N.Y. Miss Lulu Hymes, of Tuskegee, won the 100 metres and the running broad jump, and competed in the winning 400-metres relay team. She was awarded the special trophy for the most outstanding performer of the meet.

ATHOLSTAN, HUGH GRAHAM, 1st Baron, Canadian journalist, was born at Huntingdon, Quebec, on July 18, 1848, and died in Montreal on Jan. 28, 1938. Having joined a Montreal newspaper office as a boy, Graham started the *Montreal Star* in 1869 in company with George T. Lanigan ; but the two soon disagreed on a matter of politics, and Graham carried on alone in face of fantastic difficulties over which he finally triumphed. He, more than anyone else, was responsible for the raising of the Canadian contingent which served in the South African War. The whole of his journalistic and other activities was informed with a solid imperialism. He was knighted in 1908, and in 1917 a barony of the United Kingdom was conferred upon him.

ATMOSPHERE, THE. Under this heading are considered some of the most interesting results obtained from recent investigations of the atmosphere.

Composition of the Atmosphere. Owing to the discrepancies of text-book and other published figures on the

composition of the atmosphere, it may be advisable to give here in per cent by volume those which to-day seem the most reliable

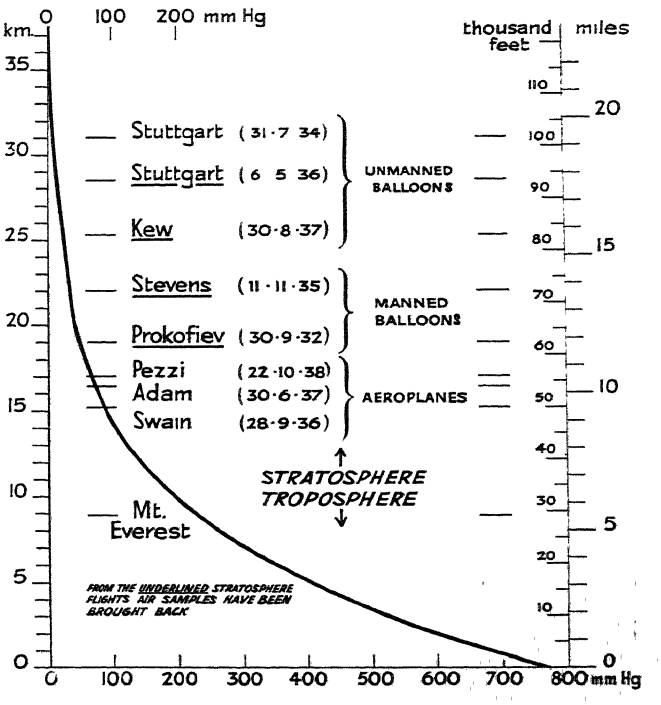
Nitrogen	78·09	100 per cent
Oxygen	20·95	
Argon	0·93	
Carbon dioxide	0·03	
Neon	1·8	10^{-3}
Helium	5 3	10^{-4}
Krypton	1	10^{-4}
Hydrogen	5	10^{-5}
Xenon	8	10^{-6}
* Ozone	1	10^{-6}
† Radon	6	10^{-18}

* Variable, increasing with height
† Variable, decreasing with height

It is probable that the figures of the table (with the exception, of course, of the last two) represent the percentage composition of atmospheric air, not only near the ground, but in the whole troposphere and the lower layers of the stratosphere From the chemical analyses carried out on air samples collected in the stratosphere (*see* the underlined flights in the diagram) it appears that at a height of between 20 and 28 km the mixing of the atmosphere by winds is incomplete, so that, under the influence of the earth's gravitational field, the proportion of the lighter gases (like helium) increases at the expense of the heavier ones (like oxygen); but the variations found are very small (amounting only to a few per cent of the figures given in the table for the respective gases), and it is unlikely that this process of gravitational separation goes on proportionally to further increase in height For the spectroscopic evidence provided by the light of the aurora still proves the presence of oxygen and nitrogen even at heights of 1,000 km, where so far no helium has been observed. This unexpected fact may be due to increase of temperature in the higher stratosphere, which leads to a mixing of the atmospheric gases and, possibly, to an escape of helium into the void.

The absolute quantity of the gases in the upper stratospheric layers is so small (*see* the curve in the diagram representing the diminution of pressure according to height) that, even if some changes in their relative proportion occur there, the figures given in the table would, nevertheless, correctly state the percentage composition of the total atmosphere—ozone and radon always excepted (*see* below).

In addition to the gases mentioned in the table, air near the ground always contains water vapour, the quantity of which may amount to four per cent of the total air. The figures in the table refer to dried air. The water vapour and Radon content diminishes rapidly with height.



Of special interest is the distribution of ozone in the atmosphere. Spectroscopic observations—carried out from the ground, during the flight of "Explorer II" (*see* below), and with automatically recording spectroscopes sent up in unmanned balloons—have shown that most of the ozone content of the atmosphere is situated between the heights of twenty and thirty km., where it is constantly formed afresh by rays from the sun; vertical air currents carry it down to the ground, where its local concentration varies considerably, since it is easily decomposed by contact with oxydizable substances. It would seem that its quantity per c.c. sometimes shows a minimum between the heights of four and ten km. There are important relations between the ozone content of the atmosphere and weather condition, which are being studied by a number of stations distributed all over the globe

Physical Conditions of the Atmosphere. Recent research work on temperature, pressure, and the electric state of the upper atmosphere confirms in general the views previously held, while at the same time adding details to our knowledge Especially the systematic investigation of radio wave reflexion has brought to light many new facts about the ionized layers at various heights of the stratosphere Space forbids a discussion here of the connexion revealed between height and intensity of these ionizations and the position and physical state (hydrogen prominences, sunspot activity, etc.) of the sun. It may be mentioned, however, that such studies have already found practical application: it has, *e g*, been observed that, by influencing the ionized layers of the atmosphere magnetic storms are detrimental to radio transmission, and since these storms tend to recur at 27-day intervals (corresponding to the period of rotation of the sun), transatlantic broadcasts are, if possible, arranged for intermediate dates.

Attempts to reach Great Heights. A new height record for aeroplanes was established in 1938 when, on Oct 22, an Italian, Lieut.-Col Mario Pezzi, attained a height of 17,074 metres, using a Caproni machine with a sealed cabin. The previous record was set up by the late Squadron-Leader M. J. Adam (British Air Force) in June 1937, who reached an altitude of 16,400 metres, wearing a pressure suit, in an open cabin

An unsuccessful attempt was made to beat the record for manned balloons established by Major A. W. Stevens (U S A), who attained in 1935 the altitude of 22·100 km. with the helium-filled balloon "Explorer II". Two officers of the Polish army hoped to arrive at greater heights by using hydrogen instead of helium as the filling gas for a

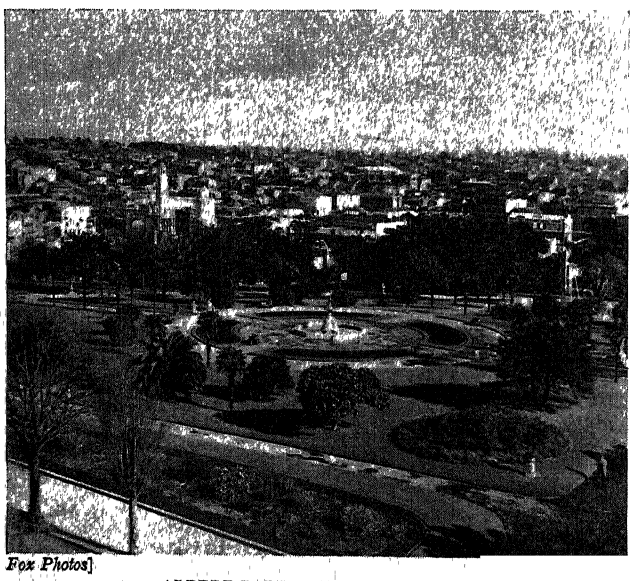
balloon of similar dimensions, but when, on Oct 14, the balloon was inflated at Zakopane (Poland), the hydrogen caught fire—probably in consequence of an electric spark—and the balloon was destroyed



For scientific investigations of the upper atmosphere, more valuable than either aeroplanes or manned balloons are unmanned balloons with automatic instruments The pilots of high-flying aeroplanes, uncomfortably enclosed in pressure suits or sealed cabins, cannot in addition adequately attend to scientific apparatus, while the stratosphere ascents of manned balloons are too expensive for sufficient flights to be carried out to collect the great number of data essential for any research on the ever-changing atmospheric conditions Further, unmanned balloons can reach altitudes of more than 31 km as compared with the record heights of 17 and 22 km of aeroplanes and manned balloons respectively (*see* diagram). Since automatic instruments can be devised for most scientific researches on the upper atmosphere, unmanned balloons are the main vehicle; only for a few special investigations do manned balloons or, for smaller heights, aeroplanes, offer definite advantages.

ATOM, THE: *see* MATTER, STRUCTURE OF

AUCKLAND. The loss of the "Samoan Clipper" on the first commercial flight from Honolulu to Auckland indefinitely delayed the opening of the air service between the United States and New Zealand, which promised to make Auckland, as terminal of two great international air routes, one of the most important air ports of the world. A Musick Memorial trophy, named after the commander of the lost flying boat, was instituted by Auckland subscribers it was to be awarded annually for the most valuable contribution to the safety of life in the air and the efficient working of aircraft, with special regard to trans-oceanic flying.

In the course of 1938 a big programme of port development was announced, as part of a ten-year plan, costing in all a million pounds.

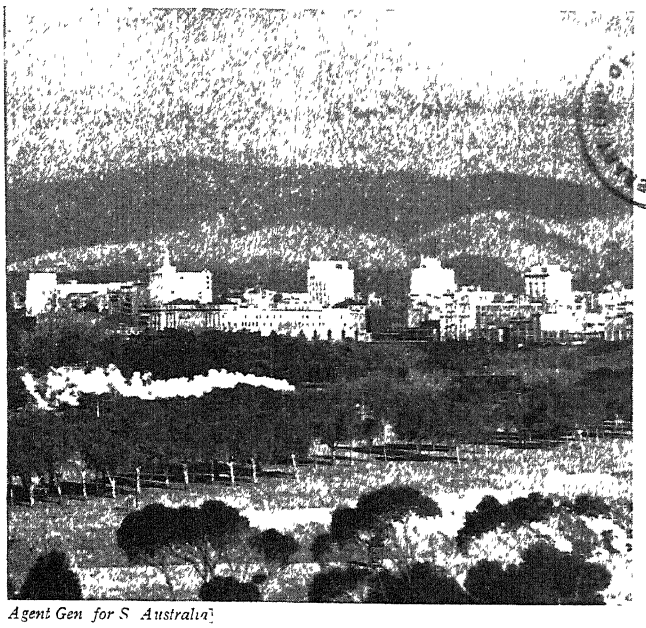
ALBERT PARK, AUCKLAND, N.Z.

In the municipal elections in July 1938, a Labour majority of fifteen to six was changed to a minority of eight to eleven In the national general election, however, the Auckland metropolitan and suburban electorates remained strongly Labour in allegiance, the National party being able only to retain its one seat among eleven

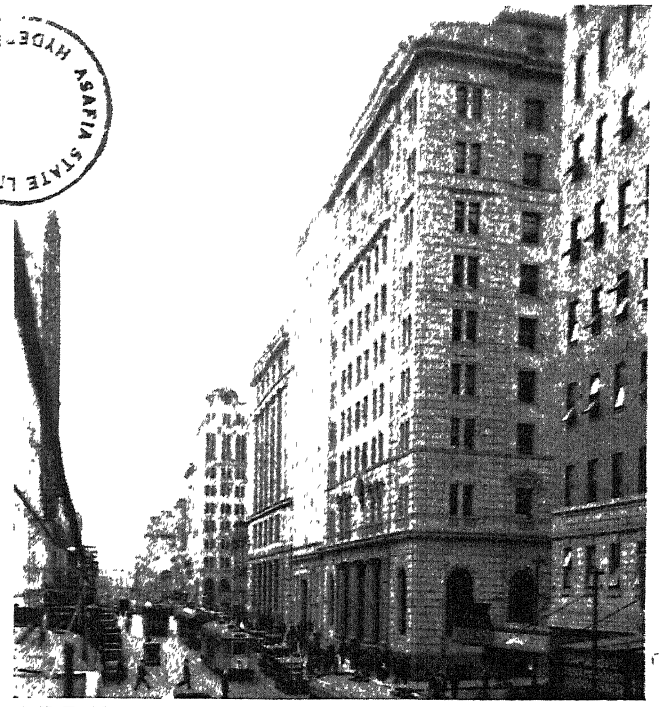
(H V H)



AUSTRALIA, COMMONWEALTH OF. It was announced on Oct 25 that the Duke of Kent would succeed Lord Gowrie as Governor-General in Nov 1939 Mr Lyons's Ministry was reconstructed in Nov 1938 Senator MacLaghlan resigned the postmaster-generalship, and was replaced by Mr A G. Cameron Brigadier G A Street became minister of defence in place of Mr Thorby, who took the portfolio of civil aviation and works. Colonel White, minister of trade and customs, also resigned, giving way to Mr J A. Perkins The prime minister formed at the same time an "inner cabinet", consisting of himself, Sir Earle Page, Mr. Menzies, Mr Hughes, Mr. Casey, Mr. Thorby, and Brigadier Street

Defence and Foreign Affairs. Armament expenditure was greatly expanded in the course of 1938. In April the government announced that it had adopted a rearmament plan to cost £43 millions in the next three years, including nearly £25 millions of additional new expenditure. The programme included the purchase of two 7,000-ton cruisers, the provision of additional anti-aircraft and fixed land defences, the establishment of a mobile garrison at Port Darwin, the addition of nine more squadrons to the air force, and the extension of munitions production within the Dominion Developments in the making of producer gas, the extraction of oil from shale, and the use of Australian woods for newsprint were also furthered with an eye to strategic needs. A strong agitation sprang up for the reintroduction of compulsory military service, a notable supporter being the Labour premier of Tasmania. Mr. Lyons, the prime minister, replied to the agitation by declaring that what was needed was concentration on the material side of defence rather than on man-power. After the international crisis of September the defence programme was again enlarged and accelerated. It was announced in December that the estimated cost over three years had been raised to £63 millions.

In a statement on Sept. 14, the prime minister declared that he had advised the United Kingdom government that Australia was in the most complete accord with its policy towards Czechoslovakia as outlined by Mr. Chamberlain and reaffirmed by Sir John Simon in his speech at Lanark. It was understood that Australian influence was brought to bear in favour of a policy of exploring every possible means of peaceful adjustment before using threats of war.



Concern continued to be felt about the course of events in the Far East. For some weeks wharf labourers in Sydney, and to a less extent in other ports, refused to handle scrap metal and certain other cargoes consigned to Japan. The government, declaring that only they could be responsible for the conduct of foreign policy, threatened to introduce the licensing system among the waterfront workers, who thereupon resumed loading the cargoes. An action by the Australian government which had international repercussions was an embargo suddenly placed on the export of iron ore. The reason given was their fear, based on an official report, that the reserves of ore would prove inadequate in the future to supply Australia's own needs, which now totalled two million tons a year and were rising rapidly.

Public Finance. The fiscal year ended June 1938 pro-

Agent Gen for S Australia

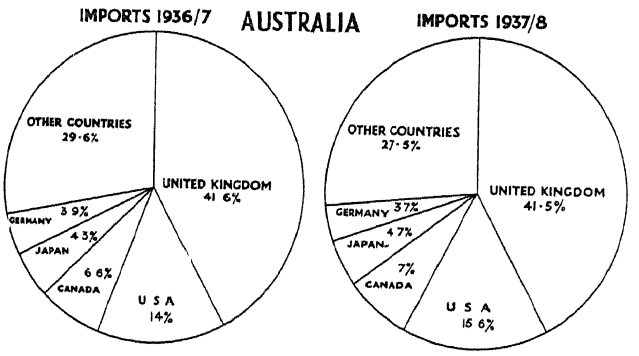
QUEEN STREET, BRISBANE

duced a budget surplus of £3,495,000, revenue showing an increase of £6,650,000 on 1936–37, and expenditure an increase of £4,428,000. The combined budget surplus of all Australian governments was £13,805,000, including sinking funds.

In May 1938 the government introduced a Social Insurance Bill, under which 1,850,000 workers, with about the same number of dependents, would be compulsorily insured against sickness and disablement The benefit for the sick or disabled would be at the rate of £1 per week, *plus* allowances for dependent children. The Bill also provided for an old-age pension of £1 per week. Male employees would pay in premiums 78*s*. per annum, employers the same for each employee, and the government £1. The cost to the government was estimated at £2 millions per annum for five years, increasing at the rate of £500,000 per annum thereafter. Meanwhile, the existing bill of £16 millions a year for non-contributory pensions would gradually fall. Professor Copland, leading Australian economist, pointed out that, whereas the number of people of pensionable age was then 26 per 100 wage-earners, in forty years' time it would have risen to 54 per 100, and that the burden might then become oppressive. The capitation fee of 11*s*. per annum fixed in the Bill for panel doctors was strongly criticized by the medical profession, and the government appointed a commission to review this part of the measure. A new section of the Treasury was formed, and Professor J. B. Brigden appointed director of national insurance.

The measure to set up an Inter-State Commission, which among its other duties would take over the functions of the Commonwealth Grants Commission, was dropped by the government in view of the opposition of the States and the urgency of pressing forward with defence finance.

At the Loan Council meeting in April 1938, total borrowing requirements were scaled down to £19,550,000. Borrowing by semi-governmental authorities, however, was on the increase. It was agreed to float immediately an internal loan of £10,250,000, including £4 millions for defence. This loan was over-subscribed. In May 1938 the Commonwealth government also borrowed £7 millions in London, of which £5 millions were wanted to fund treasury bills and the remainder for defence. The Premiers' Conference held in Oct sanctioned the issue of a new internal loan of £4 millions for defence. The state governments, however, refused to accept the federal prime minister's plan for unification of control over defence works. Mr. Lyons proposed that the States should concentrate upon those public works which were most needed in the interests of national defence, and that an advisory committee representative of both Commonwealth and States should indicate the order of priority in which the works in question should be undertaken. On this issue the Conference broke up The December increase in the defence programme was associated with a proposal to raise a further loan of £10 millions for defence purposes



Economic Affairs. In the early months of 1938 there was serious drought in many pastoral areas. It was relieved by valuable rains in May, but some of the wool was lowered in quality, a fact that contributed to the fall in the average price received for wool later in the year. In the 1937–38 season the total receipts for wool sold through brokers were £16,660,000 less than in 1936–37. The average price fell from 16·48*d*. to 12·51*d*. a lb. The position of the balance of trade deteriorated, the credit balance on account of merchandise and gold being £30½ millions smaller than in 1936–37. Increased imports were largely responsible; they in turn were due to a high rate of internal activity and of capital investment. The imports included large quantities of machinery, which could be regarded as non-recurrent. Fortunately, Australia was well provided with sterling reserves, the total of the banks' London funds having been £71 millions sterling in June 1938. Thanks partly to a sterling loan and to an influx of capital from New Zealand and elsewhere, they had fallen by only £3 millions a year later.

Among the new industries established in Australia during the year were the manufacture of shale oil, of newsprint from eucalyptus gum trees, of alkali products, steel sheets for motor bodies, tung oil, aeroplanes, and carpets. Total factory production in 1937–38 (year ended June) was esti-

mated at £188 millions, an increase of £10 millions on the previous year. There was reported to be a shortage of skilled workers in some trades. This caused a renewed interest in the problem of immigration Skilled men or trainable boys were declared to be wanted in Australia, not farming settlers In a specific statement of policy the Minister of the Interior affirmed that no special encouragement would be given to alien, nor particularly to Jewish, immigrants. Any potential immigrants other than dependent relatives must possess funds assuring their independence, and must engage in occupations in which there was opportunity for their absorption without detriment to the chances of Australian workers In December, however, the government announced its acceptance of a plan to allow 15,000 refugees from Central Europe to enter in three years

A trade delegation consisting of Sir Earle Page, Mr R G Menzies, and Colonel White, with expert assistance, spent some months in England and the United States seeking new understandings on tariffs, to replace the Ottawa agreement and to fit in with the projected Anglo-American trade treaty. Australian opinion had taken exception to the general clauses of the Ottawa agreement, whereby the government undertook to revise the tariff in accordance with the recommendations of the Tariff Board, the latter being instructed to fix rates that would give United Kingdom manufacturers full opportunities of equal competition in the Australian market These provisions were regarded as infringing Australia's fiscal autonomy. No definite new agreement could be reached with the United Kingdom, but in a joint statement the two governments agreed in effect that the general clauses would not be strictly enforced, and that meanwhile Australia would make an industrial survey with a view to specializing on certain industries.

AUSTRALIAN CAPITAL TERRITORY. In 1938 the name "Federal Capital Territory" was altered to "Australian Capital Territory". The Royal Military College was transferred from Victoria Barracks, Sydney, to its original site at Duntroon, a few miles from Canberra, where additional accommodation had been provided for the housing and training of cadets. Plans for the transfer of the Defence Department from Melbourne to Canberra were stated to be under consideration. In spite of considerable building activity a distinct shortage of housing was reported. Plans were begun for the enlargement and refurnishing of

the Governor-General's residence to accommodate the Duke and Duchess of Kent and their household when H.R.H should assume the Governor-Generalship in 1939

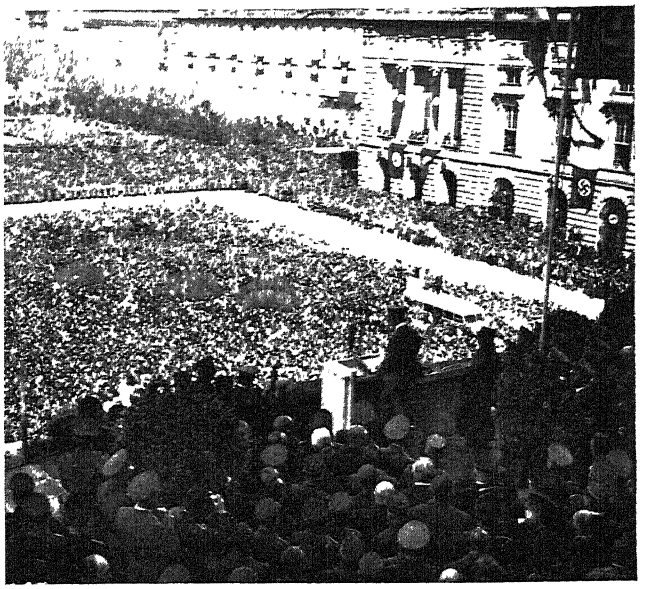
Statistics: Estimated population, Dec. 31, 1936, 9,787, No of sheep, Mar. 31, 1936, 228,000.

Finance, 1935–36: Receipts, £600,056; capital expenditure, £272,867; other expenditure, £886,110. (H. V. H.)

AUSTRALIAN LITERATURE. Though it cannot be claimed that the year 1938 witnessed the production of any work of outstanding merit, the Australian literary output has maintained a high level of competence, and has contributed further towards the growth of a sound literary background in keeping with the freedom and spaciousness of the Australian scene

Perhaps the most significant development has been the emergence of original criticism. In this respect, and quite apart from its own intrinsic worth, M Barnard Eldershaw's *Essays in Australian Fiction*, a series of critical essays on the work of eight living Australian novelists, can be regarded as an important landmark

Among other notable works of the past year was *Capricornia*, a first novel by Xavier Herbert, whose obvious sincerity, wide experience, and agreeable style combined happily to present a poignant but not too dismal picture of the aborigines. Eleanor Dark followed her *Sun Across the Sky* with *Waterway*, a story of the interplay of the forces of culture and materialism within a group of people living on the shores of Sydney Harbour. Seaforth Mackenzie's *Chosen People* had its setting in Perth, and *Portrait of Lucy*, by Winifred Birkett, the authoress of *Earth's Quality*, was a tale of pastoral life in New South Wales Alison McDougall's *Wind in the Spring* contrasted the peacefulness and youthful ardour of Australia with the turmoil and disillusion of the Old World.



Not all novels were distinctively Australian in character and setting. Martin Boyd's latest work, *Night of the Party*, was a comedy of English social life, while Christina Stead, in *House of All Nations*, portrayed in her characteristic style the methods of modern international finance.

The year which marked the 150th anniversary of Australian history appropriately produced several distinguished biographies Following closely upon Dr. Mackaness's life of Arthur Phillip came M. Barnard Eldershaw's *Phillip of Australia*, which chronicled with imaginative insight and skilful use of documentary evidence the achievements of the founder of Australia. Mr Justice Evatt's *Rum Rebellion* refuted in convincing manner the detractors of the unlucky Captain Bligh; and *The Life Story of Joseph Furphy*, by Edward E. Pescott, was a colourful biography of the man who wrote in Australia as Tom Collins.

Collected poems by Hartley Matthews on Australian soldiers in the Great War appeared under the title of *Vintage*, and A. J. Coombes, in his prize-winning essay, *Some Australian Poets*, sounded a note of optimism regarding the present and future of Australian verse.

See H M. Green, "The Development of Australian Literature" (*Australian National Review*, Feb 1938); C. Hartley Grattan, "On Australian Literature, 1788–1938" (*Australian Quarterly*, June, 1938). (L. R. M.)

AUSTRIA. At the meeting of the Rome Protocol States in Budapest (Jan. 10–12) Austria showed signs of drawing closer to Hungary for mutual protection; but Italy no longer favoured this course. On Jan. 26 Nazi premises in Vienna were raided, the secretary (Dr. Taus) was arrested and deported, plans were discovered for a terrorist *coup* in March, to be followed by a German occupation. On

Keystone

HITLER ADDRESSING THE CROWD IN THE HELDENPLATZ, VIENNA, MARCH 16, 1938

Feb. 7 Herr von Papen induced Dr. Schuschnigg to accept an invitation from Herr Hitler to visit him in Berchtesgaden. Signor Mussolini urged acceptance At the interview (Feb. 11) Herr Hitler made demands, which were accompanied by an overwhelming display of military force, which would hardly have left Austria nominal independence, nor that for long. Schuschnigg reduced these to three: an amnesty for Nazis; their admission to the administrative and public life, although within the framework of the Patriotic Front; the appointment of Herr Hitler's nominee as Minister of the Interior, with control of the police. Herr Hitler gave him three days to fulfil these demands; Signor Mussolini absented himself from the telephone, "skiing". On Feb. 15 Germany accepted the reconstruction of the Austrian cabinet, which included as Minister of the Interior Dr. Seyss-Inquart, who, after arranging his own services and instructing the police, left for Berlin for further orders. The released Nazis organized feverishly, especially in Graz. Britain and France declared the initiative to be with Italy; but Italy on Feb. 17 only welcomed the situation.

Herr Hitler's speech of Feb. 20 gave little hope of more than a respite, although Schuschnigg was strengthened by the Austrian workers (the old Social Democrat party), who on Feb. 17 and 22 promised to support a "free" Austria, whereupon Schuschnigg began negotiating with them for a restoration of their liberties. On the same day he imposed a general ban on all meetings, and warmly defended his policy before the federal diet.

By March 8 agreement had been reached with the workers' representatives, who were promised equal treatment with other groups within the Patriotic Front, some genuine representation in the Trade Union Federation, liberty of speech, and certain social legislation. Meanwhile, however, the Nazis, encouraged by Seyss-Inquart, were strengthening their hold in the provinces, especially of the south. On March 9 Dr. Schuschnigg, speaking in Innsbruck, announced that he would hold a plebiscite on the following Sunday, March 13, on the question:

"Are you in favour of a free and German, independent and social, Christian and united Austria, for peace and work, for the equality of all those who affirm themselves

on behalf of people and Fatherland?" The polling age would be fixed at 24

Germany issued instructions that the plebiscite must be sabotaged by every means and clashes provoked to provide the Reich with pretext for intervention On March 10 and 11, Germany delivered three ultimatums demanding cancellation of the plebiscite Austria mobilized partially (March 11), but in some provinces the Nazis were already in control

At 6 p.m the plebiscite was cancelled At 7 30 Schuschnigg resigned, declaring that he did so in face of Germany's threat to invade Austria; and that he had ordered the troops not to resist, in order that German blood should not be spilt At 8 p.m. he was arrested At 2 30 a.m. on March 12, after long resistance, President Miklas (who also resigned the next day) appointed Seyss-Inquart Chancellor at the head of a Nazi government. It was stated that he then asked for German troops to enter Austria, but exactly when the first entry took place, and whether before, on, or without invitation, is still uncertain. On March 12 Austria was occupied by German forces. On March 13 it was proclaimed a "Land" of the German Reich.

Herr Hitler reached Vienna on March 14. Dr. Seyss-Inquart was appointed "Reichsstadthalter", Herr Keppler, and subsequently Herr Bürckel, becoming Reich Commissioner. On April 10 the union was ratified by 4,443,208 affirmative votes out of 4,460,778 cast (Jews were not allowed to vote). The name of Austria was changed to Ostmark, and it was reorganized into seven *gaue*. The Burgenland was partitioned between Styria and Lower Austria, Vorarlberg absorbed in Swabia. For other developments, *see* GERMANY.

AVIATION, CIVIL. During 1938, the steady progress of civil aviation was hampered by the universal political uncertainty, which everywhere seemed to be forcing it along lines helpful for military purposes, but to its own disadvantage.

Otherwise, the autumn political crisis has proved the commercial aeroplane to be an effective means of peace, possibly without its help, the actual outbreak of a war could not have been prevented during the crisis Certainly, in future aerial transport will have still more influence upon the mutual relations of nations, and it may not be a futile hope that a commonwealth of all civilized nations will be shaped and strengthened by the increasing traffic through the air

Air attacks on scheduled air-liners in Spain and China have urged the necessity for an international law code dealing with the civil air traffic over territories in which warlike operations are being conducted.

Commercial Development. With regard to rentability, most long-distance air routes, especially those across the sea, are not yet self-supporting. A good example is the experience gained with the American Trans-Pacific route operated by Pan-American Airways since the end of 1935. On the route San Francisco–Hong Kong, losses of £99,655 during 1937 and of £78,389 during the first half of 1938 were experienced. A self-insurance at the rate of 10*d.* per machine-mile brought the monthly loss since that period to about £20,000, despite the good frequency and the fact that more than 500,000 machine-miles were flown before any accident occurred. Therefore, the present mailing rate on this route of 16*s.* 9*d.* per machine-mile is considered too low; rates of £1 9*s.* 7*d.* and £1 13*s.* 7*d.* have been suggested by

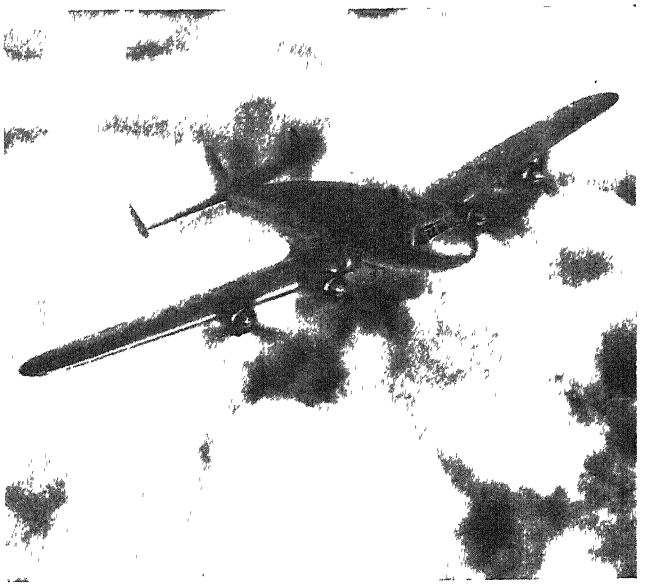
The Aeroplane]
DE HAVILLAND "FLAMINGO" AIR-LINER, FOR 20 PASSENGERS, WITH 200 M.P.H. CRUISING SPEED

P A A. for the standard 800-lb. load of mail With Imperial Airways the average expenditure on a ton-mileage basis was stated to be 3*s.* 10*d.* during 1938.

For the future the prospects for rentability appear hopeful, and this accounts for the growing interest large shipping companies are taking in transoceanic air routes

Imperial Airways and British Airways which are being merged into a national air-line company, will in future be more connected with the sphere of British shipping interests, since the new managing director can be considered an exponent of British shipping. P A A. has recently come to an agreement with American Export Air Lines, an association of American shipping companies, and the transatlantic services with Mediterranean countries will remain reserved for American Export Air Lines

The year's progress in transatlantic air services undoubtedly did not come up to expectations. Britain achieved only one flight of fifteen intended experimental crossings. Technical difficulties during tests with new equipment were the cause, besides delays due to the expansion of the air force The enlarged Short flying boats have only recently been delivered, and the De Havilland "Albatross" experimental air-liner suffered from the same fate One successful crossing was accomplished by the Short-Mayo "Mercury" four-engined floatplane, the upper component of the Short-Mayo composite aircraft.



The United States had intended 15–25 crossings by P A A. with a new flying boat model, the Boeing Clipper, which still appears to be under trials. Therefore, no experimental crossings have been realized.

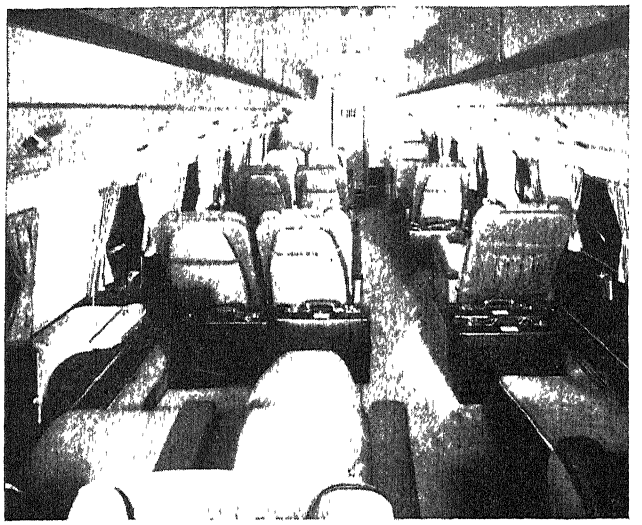
Germany can claim the major success of transatlantic flying in 1938. Not less than fourteen crossings have been accomplished (thirteen with Diesel-engined Hamburg floatplanes, and one with a four-engined Focke-Wulft Condor landplane).

France has made one successful northern crossing with the well-known "Lieutenant-de-Vaisseau Paris" flying boat, while another flight was prevented by the September crisis. An excellent record was achieved by Codos and a crew of five with a flight from Paris to Santiago-di-Chile in nearly 59 hours, with a Farman 2231 landplane.

While technically the problems of a scheduled transatlantic service could be mastered, the meteorological problems are still not so fully understood that a schedule could be maintained during all seasons. The major difficulties are presented by the northern Atlantic route, and since for Great Britain and for North America the northern route is the more essential one, the meteorological aspect of this route is intensely studied. It is obvious that an air traffic striving for rentability has to make use of the prevailing weather conditions. During the winter, gales are dominant within the normal flying altitudes, the main gale zone being located between 40° and 50° N. and 30° and 40° W. The route across the Azores is considered more favourable than via Ireland–Newfoundland, in spite of being 500 miles longer. Of meteorologically more stable appearance is the northern route via Iceland–Greenland–Labrador, but research has indicated that strong gales can be experienced up to 30,000 ft. in height, and that the icing-up danger is predominant. By intelligent navigation in vertical and horizontal directions, the flying times can be greatly influenced.

The promotion of air routes operating at great heights ("over-weather flying") has still to deal with major problems. Research has shown that at the altitudes proposed (20,000–30,000 ft.) strong gusts and clouds can be encountered influencing safety and comfort, and that electrostatic

MODEL OF FAIREY F C I AIR-LINER, FOR 30 PASSENGERS, WITH 225 M P H CRUISING SPEED



disturbances are generally of such a magnitude that wireless reception is seriously impaired. It has been assumed, therefore, in many circles that hopes for regular substratospheric air lines are exaggerated, and will not come true for a long time; but orders placed by the British Air Ministry quite recently seem to indicate that efforts in this direction are not to be discontinued. In France, Farman landplanes, with pressure cabins for sub-stratospheric flying are being prepared for experiments on the North Atlantic route during 1939

In spite of all efforts, a scheduled transatlantic service cannot yet be expected for the near future. The German Luft Hansa has recently announced a regular transatlantic passenger service, but as political difficulties are preventing a German air route to the U.S.A., the announcement can be considered of publicity value only. The problem of rentability and pay load still remains, and from the view-point of rentability, a passenger service appears to be the least prospective one.

On the route to South America via Africa, British Airways investigated the possibilities of a mail and passenger service from England to Argentina, Brazil, and Uruguay. The Portuguese government entered into agreements with Great Britain, France, Germany, and the U.S.A. for the use of the Azores in transatlantic air services.

New air routes proposed and studied recently include a northern Pacific route leading from Canada across Siberia to Russia. More ambitious is a route from Russia across the Polar regions to North America. Two successful Russian flights seem to have paved the way. Another proposal concerns a direct air route over the sea from Africa to Australia via the Cocos Islands, and will certainly be of value for safeguarding Great Britain's vital air connexion in the case of a major war.

The Imperial Air Mail Scheme which Great Britain inaugurated in 1937 has proved a complete success, of which the British Empire can be proud. The all-up air-mail service to Australia began to run during 1938. First-class mails to Australia and New Zealand are carried three times a week between England and Australia. The mail arriving by Imperial Airways flying boats at Darwin is transferred to Australian air routes. An air-mail service between Australia and New Zealand will be included in the near

K.L.M. Royal Dutch Air Lines]
INTERIOR OF ROYAL DUTCH DOUGLAS D C 3 AIR-LINER AS USED ON THE FAR EASTERN ROUTES

future. In order to speed up the air-mail service, Imperial Airways are preparing facilities for night flying on the routes to South Africa and to Australia.

Air-mail transport facilities at a flat rate for ordinary first-class mail are already working between England and 25 foreign countries, with the abolition of the air-mail surcharge hitherto in force.

In 1938 inquiries were brought into the working of civil aviation in England The Cadman committee report criticized the lack of British commercial aircraft, requested a change in organization, and advised against subsidizing air routes which are run in competition. The external air lines should be allocated between Imperial Airways and British Airways after administrative reorganization of these companies. The development policy of the Air Ministry was criticized as not sufficiently encouraging. As a result the government decided to amalgamate Imperial Airways and British Airways with an increase of the subsidy up to £3 millions.

Air services within the United Kingdom have now become subject to a licence granted by an Air Transport Licensing Authority established during the last year. An annual subsidy by the government of £100,000 is being granted for five years. All established air lines will share in it, with a top limit of £15,000 for each operator, to be calculated at a rate of 6*d* per capacity ton-mile for the first year. Eleven operating companies will benefit by this scheme.

In the United States, not less than 30,000 miles of internal air routes have been operated on regular commercial schedules during 1938. Twenty operating companies are running services to a time table; a greater number of additional air transport companies are operating taxi services.

The basis of the American airways system has been the mail service, the post office awarding mailing contracts for fixed routes and scheduled services. The mailing rates are subject to the approval of an Interstate Commerce Commission. Owing to the effects of the 1934 Air Mail Act, the subsidy of the operating companies for the transport of mail has been gradually decreased, so that at present passenger and freight receipts take the major share in the household of the United States air transport. Competition has reduced passenger fares to a large extent and, with regard to comfort, the American air traveller is treated better than the railway passenger. Free meals are served, air hostesses have proved of greater value than mere publicity, especially for nervous passengers, air conditioning and sound proofing are common, and other items have raised the convenience of travelling over long distances The freight business is centrally handled by a subsidiary company of the Railway Express Agency, under a recent pooling agreement, which also enables a joint rail-air service Incidentally, export freights by air have become a common feature, a special object being the increasing export of young chickens to South America (monthly more than 1,000,000 chickens).

The air routes operated are coast-to-coast lines (United Air Lines, Transcontinental and Western Air, American Airlines), north-to-south lines (Eastern Air Lines, Pan-American Airways), and feeder lines

The policy of the last years has been a continuous drive for speedier and bigger air-liners, with four instead of two engines It now appears that for reasons of rentability a change of this policy is taking place. Big air-liners require large aerodromes which are becoming too great a financial burden, and the investment in big and expensive aeroplanes has become a somewhat uncertain and risky business The export business for American transport aeroplanes has steadily grown up to a large extent.

The British Dominions and colonies are having their good share in the general progress of commercial aviation. Australia (Quantas Empire Airways) is operating Short Empire flying boats in connexion with Imperial Airways. The demand for air-mail carriage became so great during the end of 1938 that Imperial Airways decided not to book any more passengers on the Middle East and Far East routes for a period of several months

Canada has reorganized its air routes by the formation of a major operating company, Trans-Canada Air Lines Ltd. American equipment is being used. Canadian Airways Ltd is the only remaining independent company of significance.

South Africa is still depending mostly on German equipment, because of the lack of production in England, and a substantial order for four-engined Junkers air-liners has just been placed.

New Zealand, with a longest internal air route of 760 miles, no subsidies, and no payment for mail carried, has 1,700 route-miles of scheduled air services and an excellent safety record, no passenger being injured in more than 3,000,000 miles of scheduled flying.

In France, Germany, Holland, Switzerland, Italy, Belgium, etc , the progress in commercial aviation has been a steady one. In spite of a number of severe accidents, the record in safety and regularity has been surprisingly high. American air liners are being used to a large extent. A unification of air-line operators has taken place in Japan, where the subsidized Dainippon Air Line Company will operate all routes inside and outside Japan.

Private Flying. In England, the Civil Air Guard Scheme originated in July 1938. It is a preparation for an air force reserve in the case of an emergency. Everybody between eighteen and fifty years of age of either sex can join, provided he or she can pass the medical tests required for a private pilot's licence. The applicants usually join through a recognized flying club, which gets a government subsidy based on the amount of flying training. Light and normal class of training aeroplanes are admissible for the training, but are differently valued; for an "A" licence earned on a standard training aeroplane (above 1,200 lb. flying weight) a club will receive £50, and £30 for a pilot trained on a light aeroplane (below 1,200 lb. flying weight). Up to ten hours flying are subsidized for every C.A.G.

member per year. In an emergency, C A G members are bound for service of any kind with the R A F.

In spite of its military purpose, it is quite obvious that the C A G Scheme will stimulate the development of private and sporting flying Thousands of people who before could not afford to take up flying will be induced to take an active part in aviation, and a good number of them will certainly stick to it The private owner aeroplane and the gliding movement will profit by this increased interest

In the U S A, the Civil Aeronautics Authority has recently created a new unit responsible for the control and encouragement of private flying In 1937, private pilots with 10,000 aircraft flew not less than 103,000,000 miles, carrying 1,500,000 passengers (while 300 air-transport operating aeroplanes flew 66,000,000 miles, carrying 1,102,707 passengers). The new administrative authority simplifies the type certificate requirements for private aircraft, and brings about more uniformity between State and Federal regulations.

The year brought a steady progress in motorless flying (*see* GLIDING) Progress with rotating wing aircraft has not, however, been so marked as it was a few years ago. The use of gyroplanes remains restricted to military purposes All helicopter records are still held by the Focke-Achgelis helicopter Cross-country flights of several hours' endurance have been achieved, and the manœuvrability of this unique aircraft has been demonstrated by exhibition flights inside the Deutschlandhalle at Berlin, Miss Hanna Reitsch being at the controls.

With commercial airships, progress has nearly stagnated since the "Hindenburg" disaster. A new Zeppelin airship "L Z 131" has, however, been completed in Germany for the transatlantic service. The American government had to refuse an export licence for the helium filling gas required for this airship, as no guarantee could be obtained from the Zeppelin company that the gas would not be used for military purposes. As the new airship, the "Graf Zeppelin II" is designed for the use of helium gas, only trial flights have so far been accomplished with hydrogen filling.

Technical Development. The trend of technical progress for the improvement of transport efficiency has remained unchanged, safety in flying still being considered a secondary condition. But there are indications that the present trend will undergo a change, since the amount of severe and impressive accidents in scheduled air transport is obviously influencing and terrifying the man in the street as a prospective passenger. It does not matter much for the potential air traveller that reliable statistics prove a high safety in scheduled air traffic. The belief in statistics is nowadays not too deeply rooted, and as the newspapers are reporting an air accident nearly every day and perform this as impressively as possible, the time is approaching when an aerial traveller may again be regarded as a hero.

Otherwise, air transport has now become indispensable, and this seems to explain why the sale of tickets has not dropped to a much lower level Incidentally, statistics of Imperial Airways show that forty per cent of the passengers carried on Empire routes are men on business, thirty-five per cent government officials, twenty per cent pleasure travellers, and five per cent passengers on urgent private journeys.

High speeds and small-speed ranges will always be connected with danger. Flat gliding and climbing angles, long take-off runs, and high landing speeds tend to outgrow the dimensions of the existing aerodromes. Peculiarities connected with certain aerodynamical refinements require more skill in the control of modern air-liners. Crashes which otherwise might result in not too serious consequences are still being aggravated by fire. The strain on the pilots tends to become excessive, hence accidents even with pilots of outstanding experience The problems of bad-weather flying of fog landings, of electric discharges, and of icing-up are not yet fully mastered, while high cruising speeds and the endeavour to obtain 100 per cent regularity are increasing the risks connected with adverse climatic conditions

An analysis of accidents shows that 31 per cent personnel, six per cent power plant, and 22 per cent structural failures (nineteen per cent of the latter caused by undercarriage trouble) compare with 41 per cent failures due to bad weather and to deficiencies in the ground organization.

For all these reasons the trend for raised performances will change. Air-transport operators in the U.S A. have already hinted that transport speed will not increase. The interest in the compression ignition engine using heavy fuels is growing, but it must be realized that even engines of this kind, which are successfully favoured with German transport aircraft, cannot be considered completely fireproof. Incidentally, a Dornier D. 18 flying boat with two Junkers compression ignition engines flew a distance of 5,242 miles in 43 hours from a catapult ship off Start Point (Devon) to Caravellas in Brazil, and gave another proof of the low fuel consumption of this engine type.

The position of the British market for commercial aircraft has resulted in efforts to produce modern air-liners in England. The 5,600-h.p. Short G-class flying boats for transatlantic service (larger than the Empire class, which is performing so well), the De Havilland Albatross landplane, and the Armstrong-Whitworth Ensign landplane, all equipped with four engines, have only recently come into service, after considerable delay. In preparation are the twin-engined De Havilland Flamingo high-wing landplane for twenty passengers, a Fairey four-engined air-liner with pressure cabin, new Short landplanes and flying boats, etc. A mark of progress is the introduction of Bristol sleeve-valve engines, giving a higher take-off output and greater ranges. The Mayo composite launching system has proved its value, and the perfection of the principle is well under way.

A fair amount of progress has been achieved with high-flying commercial aircraft. Experimental flights have been carried out in the U.S.A. up to 32,000 ft. It seems that most of the technical requirements (pressure cabins for passengers, air conditioning, supercharging of engines, structural problems, etc.) can be fulfilled. Special transport aeroplanes equipped for high altitudes are under construction in America.

Schemes for refuelling during flight have given satisfaction during severe trials in co-operation with Imperial Airways, and it may be assumed that British commercial air routes will see the introduction of refuelling in flight fairly soon.

The British air traffic wireless system has recently undergone an organization into fifteen areas covering England, Scotland, and Northern Ireland. Four types of wireless service are provided. routine messages between ground stations; communication and direction finding between aircraft and the ground; weather information at fixed times; radio beacon service (homing devices) and landing approach help. The radio beacon system, extensively used on U.S.A. air routes, has recently been accused as being responsible for a number of severe accidents, and the introduction of the European system of wireless direction finding

is under consideration as an additional means of safeguarding air-liners in bad visibility.

Unfortunately, progress in blind-landing devices is slow A majority of all accidents is still due to low flying in conditions of bad visibility Even the problem of height-above-the-ground indicators cannot yet be considered as solved, but new radio altimeters, depending upon the reflection of ultra-short waves, seem promising Blind-approach systems are being perfected, and give much assistance in scheduled air traffic

De-icing equipment has become compulsory, but is still far from absolute reliability. New research work undertaken in England has opened somewhat better prospects than the mechanical devices hitherto in general use.

While the increase in size has come to a certain limit with landplanes, flying boats as air-liners of huge size are coming along. One of the largest at present under construction is a French six-engined flying boat of 65 tons all-up weight, 9,000 h.p, and 260 m p h. maximum speed

AZERBAIJAN S.S.R. On June 24 the elections to the Supreme Council of this Soviet Socialist Republic of the U.S S.R. took place, and 99·36 per cent of the electorate recorded their votes. In the capital, Baku, the percentage is said to have reached even 99·9. As a result, 231 communists and 79 non-party candidates were returned The territories attached to Azerbaijan, the Nakhichevan Autonomous S.S.R. and the Nagorno-Karabakh Autonomous Province, elected also in June their respective Supreme Councils, at which more than 99 per cent are said to have voted for the block of communists and non-party men, who were alone permitted to stand On Aug 24, ten former leading officials of the Republic were sentenced to death for high treason From April 5 to 15 a Festival of Azerbaijan art was held in Moscow and was a great success.

Area and Population :

Area 33,205 sq. miles

Population (1933) 2,891,000 (rural, 1,921,000, urban, 970,000, comprising some 20 nationalities, of which 63·3 per cent are Turks, 12·4 per cent Armenians, 9·7 per cent Russians)

Leading Cities (1936 populations): Baku (the capital) (702,000), Kirovabad (formerly Gandzha) (60,700), Nukha (30,900)

Economic Life :

Invested in agriculture (1934 37) 227·5 million roubles.

Collective farms (1937) 3,054

Large machine and tractor stations, 57; tractors, over 5,000.

Cotton yield (1937) . . . . . c. 200,000 tons

Oil output, daily . . . . 65,000 ,,

Power stations 80

Budget (1938) . . . . . 916 million roubles

Education :

Expenditure (1937) 268·3 million roubles, schools (1937), 3,304, with 620,400 pupils, of whom over 100,000 were girls, higher educational institutions, 16; workers' faculties, 26; technical colleges, 68, with 40,000 students. Illiterates, 10 per cent of population.

(S. YAK.)

AZORES. A group of nine islands (Flores, Corvo, Terceira, São Miguel, Santa Maria, São Jorge, Pico, Fayal, Graciosa) in the Atlantic, which constitute an administrative area of Portugal.

Total Area 922 sq. miles

Population (1930 Census) 253,935.

Chief Towns : Angra 10,642, Ponta Delgada 18,022.

B

BACKHOUSE, SIR ROGER ROLAND CHARLES, G.C.V.O., K.C.B., C.M.G. (1878–). British admiral and First Sea Lord, is of old Yorkshire family, being third (twin) son of the late Sir Jonathan Edmund Backhouse, first baronet, and brother to the present baronet. His life has been spent in the Royal Navy, of which he became lieutenant in 1899, commander 1909, captain 1914, rear-admiral 1924, vice-admiral 1929, and admiral 1934. He served throughout the World War, and in 1916 followed Lord Chatfield in the command of the "Lion", flagship of the 1st Battle Cruiser Squadron of the Grand Fleet. From 1920 to 1922 Sir Roger was Director of Naval Ordnance, and in 1924–25 Naval A.D.C. to the King; in 1926 he was put in command of the 3rd Battle Squadron Atlantic Fleet, and in 1928 appointed Third Sea Lord and Controller of the Navy, an office he relinquished in 1932 on being placed in command of the 1st Battle Squadron and second in command of the Mediterranean Fleet. From 1936 till his present appointment, which was made in Feb. 1938 to take effect in the following September, he was in command of the Home Fleet. Sir Roger is married and has two sons, the elder of whom is in the Royal Artillery, and four daughters.

Vandyk]
ADMIRAL SIR ROGER BACKHOUSE

BACON: *see* PIGS AND BACON.

BACTERIOLOGY.[1] Investigations into the interaction between bacteria and bacteriophage have revealed that, contrary to previous ideas, bacteriophage multiplication may occur without a simultaneous bacterial growth (although not in the absence of bacteria). This phenomenon was demonstrated in broth containing 0·25 molar sodium chloride, and in broth acidified to pH 6·0 and incubated at 28° C. Further, bacteriophages may carry with them substances stimulating bacterial growth, (1) whilst certain staphylococci contain a polysaccharide which inhibits bacteriophage action. The activity of lysozyme, the bacteriolysin of egg-white and tears, has almost certainly been traced to an enzyme, a nucleotidease, which hydrolyses the organic phosphorus-containing substances called nucleotides.

Cancer research has shown that virus-like substances can be obtained from chicken tumours. These caused tumours when inoculated into rabbits, especially if the skin bore tar-induced warts. The latter, in the absence of the virus, disappeared. Ether anæsthesia or alcohol intoxication completely destroyed the resistance of animals highly immunized against pneumococci. The loss of resistance, which was manifest only whilst the stupor was maintained, was due to the prevention of leucocytic migration to the site of infection so that instead of a localized lesion, a rapid invasion of the blood stream occurred. Evidence, based on serum reactions, has been secured, which indicates that poliomyelitis and dysentery, which resemble one another in symptoms and time of occurrence, may have the same causal agent. Undulant fever appears to have a lengthy incubation period—ten weeks to the earliest symptoms and thirteen weeks before severe symptoms arise.

Germicides for use on living tissues should combine high germicidal properties with low toxicity for tissues. In new methods of evaluating germicides, (2) a "toxicity index", a measure of both functions, is obtained. To satisfy the requirements, the index should be low. Many phenol derivatives are satisfactory, whilst iodine has the lowest index yet recorded. The mode of action of sulphanilamide, employed in antistreptococcal therapy, is still obscure. Apparently, *in vitro* sulphanilamide causes a slight reduction only in the growth rate of streptococci, and is unable to neutralize toxin or prevent its formation.

Delicate methods are required for the extraction of unstable bacterial antigens. Supersonic vibrations, which kill and disrupt bacteria, were used to liberate the antigen from group A streptococci. A soluble antigen obtained from type I pneumococci stimulated the production, in mice, of antibodies conferring protection against virulent type II and type III pneumococci, in addition to the homologous type. The multiplicity of serological types among streptococci renders serum therapy very uncertain. However, a vaccine, prepared from the repeatedly frozen and thawed cells of an avirulent rough variant of an erysipelas strain, afforded considerable protection to mice against virulent streptococci from a number of different sources. Convalescent scarlet fever patients are liable to reinfection by streptococci of another serological type. Reinfection occurs through contact with other patients, indicating the advisability of separate wards for scarlet fever cases, or small wards limited to cases caused by the same serological type. Usually three or four types are prevalent in one epidemic. The validity of the accepted serological grouping of the Flexner dysentery bacilli has been questioned. (3) The evidence suggests that the V, W, X, and Z races, hitherto regarded as each possessing its own type antigen plus minor amounts of the others' type antigens, really have a common group antigen and a distinct type antigen. Race Y is regarded as having lost the type antigen. Two new antigens of the *Salmonella* group, one somatic (XX), and the other flagellar (z6), were noted in a new species, *Salmonella kentucky*, whose formula is VIII, XX: i—z6:—. The "IV-variants" of *Salmonella typhi-murium*, namely, those lacking the antigen V, were shown to be almost invariably of pigeon origin.

New plant pathogens continue to be described. Leaf-spot diseases were caused by *Pseudomonas acernea* (*Acer trifidum*), *Bacterium cassavæ* (*cassava*), *Bact. lingustrum* (privet) and *Bacillus butyricus betæ* (sugar beet). *Erwinia cytolytica* caused a stem rot of dahlias, and *Ps. rimæfaciens* a canker of poplars. Tumours on chuckawallas (*Sauromalus varians*) were due to *Bact. sauromali*. A new type of

[1] Reference may be made to *The Principles of Bacteriology and Immunity*, by Topley and Wilson, 2nd edition, 1937, for an explanation of technical terms used in this article.

lactic-acid producing organism—a sporing rod—was described It produces lactic acid almost quantitatively from glucose, and a high-grade product can readily be isolated Potato starch preparation may be facilitated by an organism resembling *Bacillus felsineus*, which destroys cellulose and other cell-wall material, but not native starch *Chromobacterium prodigiosum* was the cause of an epidemic amongst desert locusts Past efforts to employ bacteria against insect pests met with difficulties, but a new method, in which an emulsion of the spores of bacteria pathogenic for insects is sprayed on to plants, has had considerable success against vine pests (S E J)

BADMINTON. This game is still growing in favour, there are now 1,300 clubs affiliated to the English Badminton Association, while during 1938 the U S.A. and the Malay Straits joined the International Federation, which now has fourteen members.

Entries for the All England Championships, held in London in March, were up by twenty per cent and attracted many Danes (one of whom, J. Bie, reached the final in the men's singles) and the Swedish men's champion. R. C. F. Nichols again secured the men's singles, and with his brother, L. Nichols, again won the doubles title. The ladies' singles fell to Miss D. C. M. Young, the ladies' doubles to the 1937 winners, Mrs. H. S. Uber and Miss D. Doveton, the mixed doubles to R. M. White and Mrs. Uber, and the veterans' doubles to R. G. Commin and C. Meades, the holders.

Cambridge won the inter-Varsity championship for the ninth successive year; the County championship went to Lancashire, with Sussex as runner-up, and a competition for County second teams, held for the first time in 1938, was won by Sussex Second.

No changes were made in the rules of play, but the International Federation sanctioned a slight alteration in the making of shuttles intended for use in countries in which climatic conditions render the standard make unsuitable

At the seventeenth annual Canadian championships, in Quebec, nineteen-year-old Johnny Sams of Vancouver beat Jack Storey of Toronto by 15–12, 15–10 In the women's singles, Mrs W R. Walton of Toronto beat Mrs Perodeau of Ottawa 11–4, 11–4 The American men's and women's singles were won by Walter Kramer of Detroit and Mrs Karkhull respectively.

R. C F. NICHOLS (RIGHT), BADMINTON SINGLES AND DOUBLES CHAMPION, AND HIS BROTHER, LESLIE, WITH WHOM HE WON THE DOUBLES

BAHAMAS. On Discovery Day, 1938 (Oct 12), the Bahamas Government Development Bureau was opened in London by the Under-Secretary of State for the Colonies

The year saw the first harvest of cultivated sponges At the end of 1938 a bed of 180,000 artificially cultivated sponges was destroyed, probably by subterranean seismic disturbance

There was considerable development of the Out Islands, especially Eleuthera, Grand Bahama, the Bimini, Gap Cay (where a permanent camp for big-game fishermen was established), and Andros (new roads, landing wharf, and sailing club) Two seaplanes were added, making four to link up the Out Islands.

A record tourist season was enjoyed The new Shoreham Hotel was opened in December, and negotiations were successfully concluded for the taking over of the British Colonial Hotel by a Canadian millionaire. The Emeral Beach Club was opened. (A. A)

Area and Population :

Expenditure, ordinary (1938)	£400,681
Public Debt (Dec. 31, 1937)	£144,275
Notes in Circulation (Dec. 31, 1937)	£74,400

Education :
Government schools: scholars—boys 4,402, girls 4,181
Private schools: scholars—boys 2,791, girls 4,807
Secondary schools: scholars—boys 202, girls 201.

BAHREIN ISLANDS. Trade continued good during the year and the pearl-diving industry showed some improvement, though prices still remained low owing to the effect of the European situation on the pearl market. Government revenue expanded somewhat as a result of the continued development of the Bahrein Petroleum Company's oilfield. But as over one-third is absorbed by the civil list and the oil royalties due to the ruling family, it was not possible to put into effect any new schemes beyond the construction of a large hospital which will have an English doctor and woman doctor on its staff. (A. Mn.)

Area and Population :
Area 213 sq. miles.
Population (Dec 31, 1936 estimate) 120,000.
Ruler : H.H. Shaikh Sir Hamad bin Isa al Khalifah.

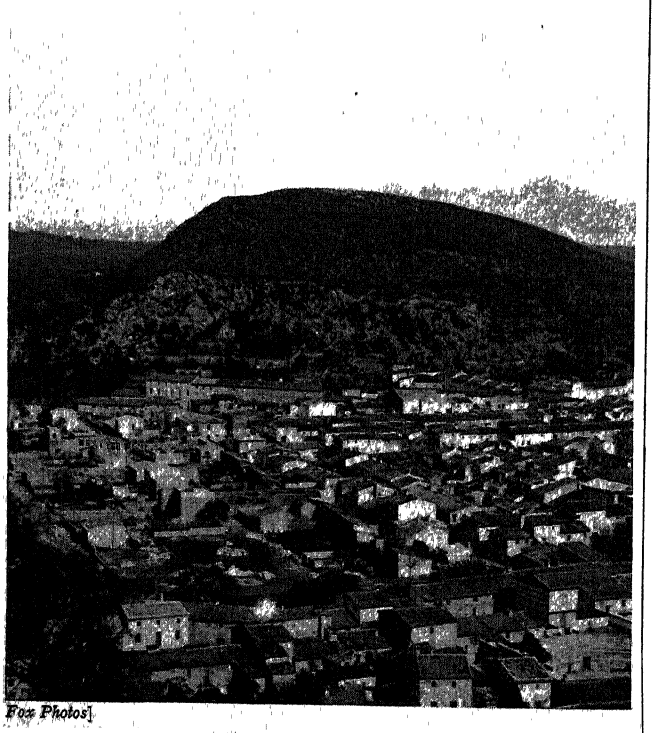
BALANCE OF TRADE. In the course of 1938 some of the factors that had affected national balances of trade in 1937 were reversed, or rather the tendencies that began to show themselves in the latter part of 1937 were continued and intensified. Those tendencies included a substantial fall in the prices of primary commodities, associated with very much reduced purchases by the United States, a corresponding fall in shipping freights, with consequent effects on invisible balances of payments, and a tendency for primary producing countries to incur deficits on their external balances as a result of continued high imports while their exports fell in value. The distortions of world balances of trade, produced by the wars in Spain and the Far East, were protracted. There was no significant change in the small international flow of long-term capital, but there were two outstanding movements of short-term capital: a return of "hot money" to France after the formation of M. Daladier's government and the new depreciation of the franc; and a refugee movement of European capital to the United States during the period of war emergency in September and subsequently.

United Kingdom. In spite of lower prices ruling for primary products, imports into the United Kingdom continued to run at a high level, the average monthly figure being £72·3 millions in the first half of 1938, against an average of £79·5 millions in 1937. The export market, however, was depressed. The *Economist* index of the volume of exported manufactures (1935 = 100) fell from 113½ in July 1937 to 93½ in July 1938. The total adverse balance of commodity trade in 1937 had been £432 millions, in the first half—usually the more favourable half—of 1938, it totalled £401 millions. The proportion of United Kingdom exports going to Europe was actually rising slightly, despite the disturbed political conditions; the depression came in exports to foreign countries outside Europe, notably Japan, China, Mexico, Brazil, and certain other South American countries, and the United States. The bilateral balance of trade with the last-named country showed a striking change. In the second quarter of 1937 there had been a debit balance of £13·1 millions against the United Kingdom on a total trade of £33·7 millions; in the second quarter of 1938 the total trade had fallen to £31·7 millions, but the adverse balance had risen to £20·5 millions.



United States. An enlargement of export balances was indeed characteristic of the United States' international trade in 1938. In the twelve months ended June 1937, she had actually had an aggregate inward balance of $103 millions, exports totalling $2,838 millions and imports $2,941 millions. In the following twelve months her exports rose to $3,402 millions, but her imports were sharply curtailed in value as a result of the industrial recession, falling to $2,360 millions. The result was the enormous credit balance of trade of $1,042 millions. The strain caused by this distortion was felt virtually throughout the world, and helped to cause the depreciation of sterling and other currencies against the dollar in the latter half of 1938. The visible credit balance was not offset by a net debit on invisible account, but on the contrary was augmented by a net credit due to debt service and an import of capital.

Europe. The further and definitive depreciation of the French franc in May 1938 appeared to have its effect on France's balance of foreign trade. Although imports kept up to a high level—an average of 3,879 million francs a month in the first half of 1938 against an average of 3,525 millions in 1937—exports also expanded, to an average of 2,323 million francs against 1,995 millions. The net debit balance was thus little changed. The other former members of the gold bloc, as a group, also had a more favourable experience in regard to their trade balances. Switzerland's adverse balance of commodity trade fell from 351 million Swiss francs in the first six months of 1937 to 163 millions in the similar period of 1938. The Netherlands reduced an average adverse balance of 33 million gulden a month in 1937 to an average of 23 million gulden in the first six months of 1938. Belgium's trade balance was little changed. All these three countries suffered a decline in the value of their exports, but were able to offset it by paying less for imports. The experience of the Scandinavian countries was generally favourable. Denmark, who had incurred a total debit balance of 91 million kronor in 1937, almost exactly balanced exports against imports, on a slightly lower total of trade, in the first six months of 1938. Norway's monthly adverse balance, which had averaged 38·5 million kroner in 1937, fell slightly to 37·8 millions in the first six months of 1938, while Sweden's also fell from 17 million krone a month in 1937 to 15·2 million krone a month in the first half of 1938. Germany, on the other hand, had a less favourable experience in this matter. A credit balance of RM 445 millions in the whole of 1937 became a debit balance of RM 108 millions in the first half of 1938. The problem of the balance of trade was not eased for Germany by the absorption of Austria. In 1937, the latter incurred a net debit of 136 million schgs. on commodity trade account, and imports continued to exceed exports at roughly this rate (omitting trade with Germany) after the *Anschluss*. At the time of writing it was impossible to tell what effect the further absorption of the Sudeten German areas would have on the trade balance of the Greater Reich. Czechoslovakia herself, with an average credit balance of 83 million crowns per month in 1937, more than doubled this figure in the first half of 1938. A remarkable by-product of Germany's trade methods was a change in Yugoslavia's net balance of commodity trade from a credit of 400 million dinars in the first half of 1937 to a debit of 258 millions in the corresponding period of 1938; for Yugoslavia, doing a large proportion of her trade with Germany, attempted to liquidate the balances she had previously built up in her clearing account with that country. Italy's trade balance became more favourable. Having had an average monthly debit balance of about 300 million lire in 1937, she contrived to maintain her exports at practically the same level in the first six months of 1938, while reducing imports by nearly 200 million lire a month.

Other Countries. While some industrial creditor countries like the United Kingdom were incurring increased inward balances of trade, the experience of typical primary producing countries was also one of strain in 1938. The position of Argentina was specially striking. In the first six months of 1937 she had had a credit balance of 740 million pesos, as between exports and imports; in the first six months of 1938 this became a debit balance of 35 millions. Argentina needed a net credit of about 500 million pesos a year in order to pay for debt service and other invisible imports. Australia had a not dissimilar experience. On merchandise only she achieved a credit balance of £646,000 in the year ended June 1938, compared with a balance of £33,511,000 in 1936–37. Her gold exports, however, had increased from £14,580,000 to £16,544,000. There was no need to look farther for the explanation of

her loss of credit balance of trade than her trade with the United States, with which she had a credit balance of £2,033,000 in 1936–37 and a debit balance of £9,037,000 in 1937–38. New Zealand likewise could not make her exports keep pace with rising imports. Her credit balance of trade fell from £12,614,000 in 1936–37 (year ended March) to £6,943,000 in 1937–38. In the Far East, China's debit balance of trade fell from 30 million standard dollars a month in 1937 to little more than 20 millions a month in the first half of 1938. Japan's position was peculiar. In 1937 she had imported very large quantities of raw materials for the prosecution of the war in China and in anticipation of restrictive measures, whereas in 1938 her lack of means to pay obliged her to curtail her imports abnormally. Hence a debit balance of 618 million yen in the first half of 1937 fell to only 193 million yen in the same period of 1938. (H. V. H.)

BALEARIC ISLANDS. Minorca remained Republican; the other islands were still Nationalist. Majorca is still an important Nationalist-Italian air-base, and figured in all accounts of the heavy raids made on Barcelona and the Mediterranean coast generally, especially in January, February and August. When, on June 25, the Republicans decided to revoke their pledge to refrain from bombing Nationalist cities, Palma was mentioned as a chief objective; no such attacks, however, materialized. In a semi-official dispatch dated from Palma in August, and describing the Italian aerial attacks on Mediterranean towns, reference was made, apparently for the first time, to the "Legionary Aviation of the Balearics" (*The Times*, Aug. 15). Notable articles on the Balearics and the Civil War, by Professor J. Holland Rose, were published in the *Manchester Guardian* (March 19, Oct. 20). G. Bernanos, in *Les Grands Cimetières sous la lune* (Paris, 1938; translated as *A Diary of my times*, London, 1938), describes in detail, from the Republican standpoint, events alleged to have occurred in Majorca during the early part of the Civil War. (E. A. P.)

POLLENZA, MAJORCA

This administrative province of Spain, consists of four large islands, Majorca (1,312 sq. m.), Minorca (278 sq. m.), Iviza (230 sq. m.), Formentera (35 sq. m.), and eleven smaller islands.

Area and Population:
Total Area 1,935 sq. miles
Population (est. Dec. 31, 1934) 376,735
Chief Towns: Palma (Majorca), Port Mahon (Minorca).
Language. Spanish (Catalan)
Religion. Roman Catholic

BALKAN ENTENTE. The Council of the Balkan Entente met at Ankara on Feb. 5–8. It agreed to adopt an attitude towards Italy on the Abyssinian question which accorded with the friendly feelings of the signatories towards Italy. It was hoped that Italy would accede to the Montreux Convention. The principle of non-intervention in Spain was upheld, although *de facto* contact with General Franco, to safeguard commercial interests, might be established.

The Entente subsequently officially welcomed the Anglo-Italian Agreement. A second, routine meeting was held at Geneva during the League Assembly; economic conferences in Istanbul (April), Athens (May), and Split (Sept.), a Press Conference in Istanbul (April); a meeting of Naval Staffs in Athens (July) and of General Staffs in Athens (Nov.).

The Greco-Turkish Treaty of April strengthened the Entente. More important still was the Salonica Agreement of July 31 with Bulgaria (*q.v.*), which did much to remove the anti-Bulgarian character of the Entente and to make it a genuine instrument of Balkan solidarity. (C. A. M.)

BALKAN LITERATURE. The 1938 literature of various countries of South-Eastern Europe is reviewed below.

Rumania. The most important event was the publication of the new "Carol II" Bible. Prominent among the poets were G. Gregorian; Aron Cotruș, whose *Horia*, *Țara* (the Land), and *Minerii* (the miners) deal with social and historical problems in a manner at once nationalist and revolutionary, the lyrical and mystic V. Voicilescu, and Emil Bota. The Rumanian novel favours large canvases and striking themes; thus C. Petrescu's *Mene, Tekel, Fares* begins a trilogy on the peasant revolution of 1907. D. Teodorescu's *Robul* (the Slave) is a satire on contemporary society.

Bulgaria. The leading poetess is E. Bagriana. A native of the Dobruja, she expresses in purely lyrical form the sufferings of her countrymen. Her latest works are *Reveillon*, *Human Heart*, and *The Express through the Desert*. Another important lyric poet is N. Liliev, while the veteran Cyril Christov represents an older generation. Narrative literature suffered a severe loss through the death in 1937 of J. Jovkov, Bulgaria's leading novelist. His latest work, *If they could Speak*, was a collection of short stories dealing with provincial life. His most prominent successors in the short story are Eline-Pelline, G. Raichev, G. P. Stamatov, and Svetoslav Minkov (*Alchemy of Love* and *A Canine Story*).

Albania. Literature is still sparse. The 25th anniversary of the national independence (Nov. 1937) was celebrated by the issue of Gjergj Fishta's definitive edition of the great national epic *Lahuta e Malcis* (The Lute of the Mountains), which celebrates the heroic struggle of the Albanians against the Turks. On the same occasion, the publication was begun of a series of volumes of folk-lore entitled *Visari Kombëtar* (National Treasure). In 1938 L. Paradeci, the leading Albanian poet of the younger generation, published a second volume of lyrics under the title *Yhhi i Zemers* (The Star of the Heart).

Lipnitzki

"ORIANE OU LE PRINCE D'AMOUR", PRODUCED BY SERGE LIFAR AT THE OPERA, PARIS

Greece. The unpublished poems of the famous national poet A. Valaoritis were posthumously collected and issued. S. Myrivilis' *To Tragoudi tis Gis* is a long prose-poem of philosophical and pacifist tone Other interesting works are Z. Papantoniou's *I Tmysia*, short stories by a master of psychology and style, A. Tertzakis' *I Memexedenia Politeia*, a novel on modern social life; N. Kazantzakis', *Taxidevontas*, impressions from both sides of the Spanish Civil War; A. Tarsouki's *Ta Aspra Nisia*, travel-impressions of the Aegean Islands; K. Politis' *Eroica*; K. Parasomos' *Deka Ellines Lyrikoi*, critical appreciations of modern writers; and P. Vlasto's *Paravlastara* (1937), in which the author traces the influence of Nietzschean philosophy on the ideology of the "demotike" in Greece.

Yugoslavia. Tin Ujović still carries on the tradition of the "Bohèmes". The most promising of the younger lyric poets is Rade Drajneć. Miroslav Krneža, whose principal theme is the transition between the old and the new generations of Yugoslavia, is the most important novelist and playwright; but Borivoj Yevtić, of the Sarajevo theatre, caused a sensation with his national-revolutionary drama centring upon the figure of Princip, the assassin of the Archduke. Three interesting writers of short stories and sketches are D. Vasić, who describes war, and V. Petrović and D. Drangić, who deal with provincial life in the Voivodina and Bosnia respectively.

(N. MA.)

BALLET. [The abbreviation *c.* signifies "choreography by."] Ballet retained its appeal in 1938, except in Italy, where various events combined temporarily to stifle it. The principal event of the year was Massine's secession from the De Basil company. This resulted in the formation of a new company, the Ballet Russe de Monte Carlo, with Massine as artistic director and *maître de ballet*, and including Danilova, Toumanova, Tarakanova, Guerard, Panaieff, and Youskevich, with the addition of Markova, N. Theilade, and F. Franklin. The De Basil Ballet acquired a new board of directors, with Fokine and Lichine as choreographers; its principal dancers were Baronova, Riabouchinska, Lichine, and Shabelevsky, with Nemtchinova as guest artist.

During the London season the Ballet Russe de Monte Carlo produced: *Gaîté Parisienne* (Offenbach), *Seventh Symphony* (Beethoven), *Nobilissima Visione* (Hindemith), all *c.* Massine. The first was a lively but inferior work in the style of *Beau Danube*; the second, a further essay, partially successful, in symphonic ballet, its second movement being the best; the last, based on the life of St Francis of Assisi, was notable for the religious fervour conveyed by Massine's dancing and for Theilade's rendering of Poverty. This company's revivals were *Giselle* with Lifar (guest artist) and, alternatively, Markova or Toumanova, Markova being particularly brilliant in the second act; *Beau Danube*, with new and indifferent costumes; and *Coppélia*, including the generally omitted third act. A minor sensation was provided by the first London production of Lifar's *Icare*, for which he composed both the choreography and the rhythms, the latter being arranged for percussion orchestra.

The De Basil company presented: *Protée* (Debussy), *c.* Lichine, a slight but attractive work, and *Cendrillon*, based on the story of Cinderella, *c.* Fokine, which lacked the distinction of *L'Épreuve d'Amour*.

The Vic-Wells Ballet produced four ballets only, owing to extensive rehearsals connected with a contemplated production of Tchaikovsky's masterpiece, *La Belle au Bois Dormant*. These were *Horoscope* (Lambert), *The Judgment of Paris* (Berkeley), and *Harlequin in the Street* (Couperin)—a revised version of the ballet prologue to

Lipnitzki

SERGE LIFAR IN "ORIANE"

Molière's *Le Misanthrope*, given in 1937 at the Arts Theatre, Cambridge, all *c.* F. Ashton; and *Le Roi Nu* (Francaix), *c.* N. de Valois. *Horoscope*, in the manner of a symphonic ballet, was the most interesting and revealed a dancer of promise in Michael Somes. *Le Roi Nu* (*Emperor's New Clothes*) marked a decline from the standard of *The Rake's Progress* and *Checkmate*. The Ballet Rambert produced several short ballets: *Valse Finale* (Ravel), *c.* W. Gore; *Croquis de Mercure* (Satie), *c.* A. Howard; *The Tartans* (Boyce), *La Péri* (Dukas), both *c.* F. Staff; also a new version of *Cross-gartered* (Frescobaldi), *c.* W. Toye. In the provinces, The Merion Welsh Ballet Society (Bala) showed a definite advance with *Birthday of the Infanta*, *c.* N. Brooking, and *Bramwen* and *Our Village*, both *c.* H. Johnson.

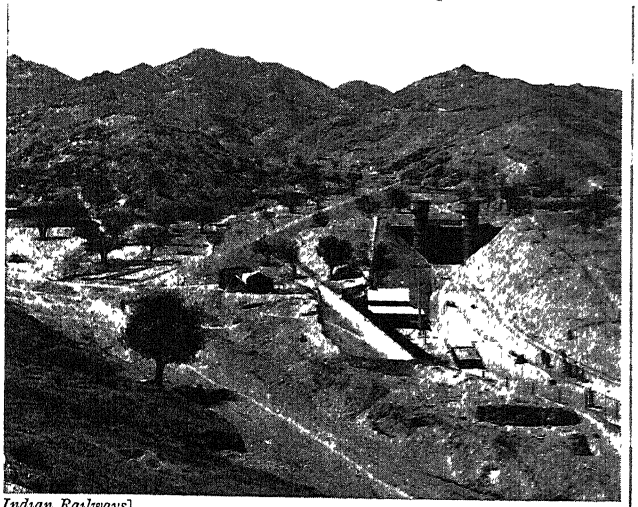
Companies visiting London were the Ballets Jooss—which produced nothing new, except that *The Seven Heroes* was given a new first act—and the Palestine Singing Ballet, which had a certain interest from the use of folk music and national costumes, though the dancing of six Yemenite girls forming the troupe was primitive in the extreme.

In Paris, Lifar produced at the Opera: *Oriane ou le Prince d'Amour* (F. Schmitt), *Le Cantique des Cantiques* (Honegger), and *Aeneas* (Roussel); the first being the most successful. At the Opéra Comique, C. Tcherkass presented *Suite Provençale* (Milhaud), an interesting ballet based on peasant life in the South of France. Another new company which attracted attention at the Ambassadeurs was the Ballets de la Jeunesse, with Egorova and Bartholin as choreographers, which gave *Visions Juveniles*, *Les Bronzées*, *Trois Images*, and *L'Amoureux et la Bien Aimée*. At Brussels, ballet at the Théâtre de la Monnaie continued to develop under L. Katchourovsky.

New productions of Soviet Ballet were *The Night before Christmas* (Assafiev), after Gogol, *c.* Varkovitsky, at Leningrad, and *The Caucasian Prisoner* (Assafiev), after Pushkin, given at Leningrad with *c.* Lavrovsky, and at Moscow with *c.* Zakharov. At Leningrad, Petipa's *Les Saisons* was revived by Ponomarev.

The Royal Hungarian Ballet (Budapest) presented *Iphigénie* (Gluck), *Salade* (Milhaud), and *Pozsonyi Majalis* (Rajter), all *c.* G. Harangozó, the Lithuanian Ballet (Kaunas) revived *Le Roman d'un Momie* (Tcherepnin); the Danish Ballet (Copenhagen) produced *The Circle* (Tchaikovsky), *c.* N. Therlade, the Yugoslavian Ballet (Belgrade) achieved considerable success with *The Devil in the Village* (Fran Lhotka). The Latvian Ballet (Riga) showed considerable activity under the leadership of dancer-choreographer, O. Lēmanis, who also produced *Autumn* (Kalniņš) and *The Nightingale and the Rose* (Kalniņš), the first was unusual in that it began and ended with choral singing, while ingenious costumes suggested trees with branches and leaves. (C. W. Be.)

BIBLIOGRAPHY. Brants, Georgs, *The Latvian Ballet* (Tāle, Rigā); *Magyar Balletek* (M. Kir. Operaház, Budapest), Lifar, Serge, *Ballet: Traditional to Modern*, Beaumont, C. W., *Complete Book of Ballets*.



The United States continued in 1938 to develop the national ballet. Ballet Caravan, a company of twenty young dancers trained in the School of American Ballet, started on its first transcontinental tour in October, presenting new compositions on native themes, *Billy the Kid*, *Filling Station*, *Yankee Clipper*, and *Pocahontas*, and calling on American musicians and artists for scores and décors.

Catherine Littlefield's Philadelphia Ballet visited Chicago, Boris Romanoff, of Rome and the Royal Opera, stepped into the stewardship of New York's Metropolitan Opera Ballet, which George Balanchine, as head of the young American Ballet Company, had vacated in the spring. Bohm, Mordkin, Kosloff, among famous European artists, carried on resident and touring companies in the United States.

Ballet on ice and screen became increasingly popular. The Norwegian skater, Sonja Henie, starred in both media, and her compatriot, Vera Zorina, starred in a Technicolor sequence in *The Goldwyn Follies*, supported by an American ballet, under Balanchine.

Uday Shan-Kar, with his Hindu dancers and musicians, after performances in England and America, retired at the height of his success to establish a school of the dance and related arts in India.

BALUCHISTAN. About the size of Italy, Baluchistan lies on the Arabian Sea, wedged in between Persia, Afghanistan, and India. Part is a minor province of British India; the rest a congeries of States under the superintendence of an Agent to the Governor-General, who is also chief commissioner of the province. Sir Walter Parsons is the present official. The residents of British Baluchistan (area 54,228 sq. miles; pop. 463,508) are mostly Moslems, speaking Pushtu, but the Brahui tribes retain a language closely allied to the Dravidian tongues. The capital, Quetta, 5,500 ft. above sea-level, contains an important frontier cantonment, with the Indian Staff College; both city and cantonment are being rapidly reconstructed after the calamitous 1935 earthquake. The Agency includes Kalat, whose chief enjoys a subsidy of £19,000 a year (area 73,278

sq. miles , pop. 342,101). The only other important State is Las Bela (7,132 sq miles ; pop. 63,008). (ME.)

BANK FOR INTERNATIONAL SETTLEMENTS. The activities of the bank have naturally been affected by the tension through which Europe has passed during the latter half of 1938. Thus the total of the balance sheet of the bank which, to a great extent, reflects the amount of currencies held by central banks, was reduced from 626·5 million gold Swiss francs at the end of August, to 576·6 millions at the end of September. Being a depository for central bank balances included in monetary reserves, the Bank for International Settlements maintains the highest form of liquidity ; moreover, in the various markets no difficulties of moving funds were experienced by the bank even at the height of the crisis. By December, the total of the balance sheet had risen again to over 600 millions, so that more than one-half of the decrease had by then been recovered.

When central banks hold gold in preference to currencies, they are necessarily compelled to exchange gold against currencies, and vice-versa, at frequent intervals. As a result, the Bank for International Settlements has seen a considerable increase in the volume of its current transactions, which have been maintained at a high level for a longer period than for several years past. Furthermore, the bank has continued to extend, via central banks, certain credit facilities for commercial purposes, and this particular kind of business has proved specially welcome in markets in which the possibilities of forward covering of exchange risks are not normally available.

The result of the business operations for the financial year ending March 31, 1938, differs little from that for the preceding year, net profits being 9,012,000 gold Swiss francs. A six per cent dividend in gold has again been distributed, and the usual allocation has been made to reserves, which on March 31, 1938, were 24·3 million gold Swiss francs as compared with a capital of 125 million gold Swiss francs.

At a time when the world's exchange markets are in a disturbed condition, the leaders of central banks have found it more than ever necessary to keep in close contact with each other ; the Bank for International Settlements has continued to serve as a centre of monetary contact and collaboration. The monthly meetings of its board have been most regularly attended by the members, the majority of whom are governors of central banks ; and in various ways relations have been maintained with central banks not represented on the Board.

BANKING. During 1938, the British banking system had to cope with two new developments : the first was the trade recession and fall in prices which, although arrested in May, 1938, has left both trade and prices at a lower level than they were in early 1937 ; the second was the outflow of funds from London, due first to the French repatriation of May, 1938, and second to the autumn international crisis and the aftermath of uncertainty which it left behind it.

When trade is expanding and prices are rising, the demand for bank advances automatically grows. In the absence of any enlargement of the credit base and augmentation of bank cash, growth ultimately reaches the point where the banks have to compensate for it by realizing their investments. These realizations in turn affect the security markets, causing the price of government securities to fall, and equally bringing about a rise in the long-term rate of interest. This actually happened in 1937. Between Nov. 1936 and Nov. 1937, the following movements took place.

(1) Clearing bank cash rose only from £233 to £235 millions.

(2) Clearing bank advances rose from £890 to £986 millions.

(3) Their investments fell from £656 to £634 millions.

(4) The price of 2½ per cent Consols fell from 85 to 75, and their yield rose from 2·94 to 3·33 per cent.

It is arguable that this increase in the long-term interest rate was one of the many causes of the 1937–38 recession. The trade recession reversed this trend. As the accompanying table shows, the demand for credit has eased and advances have fallen from £984 to £967 millions. Cash has remained unchanged at £234 millions, and so the banks have been able to increase their investments from £639 to £645 millions. Here, however, the contrast ceases, for there has been no improvement in security prices nor fall in the long-term interest rate.

The explanation of this must be sought in the second chief development of the year, namely, the outflow of funds, first to France, and later during the crisis to the United States and other foreign centres. The table shows that deposits have dropped from £2,312 to £2,256 millions, and then reflects the outflow of foreign funds. The immediate reaction of their outflow is easy to trace. To cover their outflow across the exchanges, the British Exchange Equalization Account (*see* EXCHANGE EQUALIZATION FUNDS AND GOLD MOVEMENTS) sold gold. The sterling received for this gold was re-invested in British Treasury bills, so that more bills came to be held by the Exchange Account and less by the banking system. Hence the counterpart to the reduction in the banks' deposits was not a loss of cash, but a contraction in their own bill portfolios and also in their loans against bills. The table shows how discounts have fallen from £296 to £268 millions, and their call and short loans from £165 to £148 millions.

In Oct. 1937, 10·1 per cent of the banks' deposits were covered by cash, and 70·2 per cent offset by investments and advances. A year later the corresponding ratios were 10·4 and 71·6 per cent. The latter ratio is probably now as high as bankers like it to get, for neither investments nor advances are so liquid an asset as bills of exchange or call and short loans. Thus, while the banks are now well enough supplied with cash, they cannot increase either their investments or advances by very much unless they can also

obtain more bills. In this respect the outflow of foreign funds and the consequent reduction in the quantity of bills available to the banks has weakened their ability to lend or invest. Also the outflow of funds and still more the nervousness which caused it weakened security prices. That is why the limited increase in the banks' investments did not lead to a recovery in the stock markets.

Canada. Until the middle of 1938, conditions were affected by the recession in the United States. The Bank of Canada continued its cheap money policy. As a result of this, the chartered banks' balances at the Bank of Canada rose during the year ended Nov. 9, 1938, from $209 millions to $222 millions. The Bank of Canada maintained its gold reserve at $180 millions. Possibly because of the autumn, 1938, recovery, the note circulation rose during these twelve months from $160 millions to $176 millions. The chartered banks did not fare too badly. Deposits in Canada rose from $2,430 to $2,484 millions during the twelve months to June 1938, while investments increased from $1,442 to $1,462 millions, and advances from $728 to $786 millions. There was also an improvement in profits, but these are still much lower than during the decade following the war. New industries in Canada, such as mining, need less bank credit than agriculture, while the chartered banks have lost some income from the gradual transfer of their note issues to the Bank of Canada. They have, however, during recent years been able to economize through the closing of unremunerative branches.

Early in 1938 the Dominion government acquired all the private share holdings in the Bank of Canada, which is now entirely a government-owned central bank.

India. Banking in India was also influenced by the recession, the most important symptom being the deterioration in India's external trade balance. This forced the Indian Reserve Bank to draw heavily on the sterling balances, which fell from Rs. 96 millions to a mere Rs. 29 millions during the year to Oct. 29, 1938. In April 1938, the deterioration in the trade balance affected the exchange. The Reserve Bank had to abandon its minimum buying rate of 1*s.* 6$\frac{1}{8}$*d.* for sterling, and let the rate down to 1*s.* 5$\frac{25}{32}$*d.* The autumn saw a slight recovery to 1*s.* 5$\frac{15}{16}$*d.* The internal banking position on the whole remained satisfactory. The banks had sufficient cash available for the financing of seasonal requirements, while the advances and discount of the scheduled banks were well maintained. Banking profits also kept up well, in spite of the low level of money rates. The chief banking problem of assimilating the mass of indigenous bankers and making credit cheap throughout the country instead of only in the larger centres, still awaits solution, and many indigenous bankers are slow to avail themselves of the Reserve Bank's facilities.

Australia. The leading banks were faced during 1938 with problems arising out of the contraction in Australia's export surplus and the drought over many parts of the country. The falling-off in exports made inroads into the banks' London funds which form part of their cash. So far these inroads have not been serious, but there is a likelihood of a further erosion next year. Meanwhile, the drought has added to the demands for credit. The net result has been some decline in the trading banks' aggregate cash ratio and an increase in these rates of advances to deposits. By the June quarter of 1938 the former had fallen to 10·5 per cent (against 12·7 per cent a year before) while the latter had risen to 88·98 per cent (against 83·3 per cent). The opinion has been expressed that the banks are already having to exercise greater discrimination in their advances, and that next year it will, in the absence of an enlargement

Associated Press]

DR. SCHACHT AND MR. MONTAGU NORMAN, DEC. 15, 1938

of the credit base, become even more difficult to meet legitimate credit needs.

South Africa. In spite of the recession the commercial banks well maintained their strength. Advances contracted slightly during 1938, but deposits and investments increased. There was no sign of any stringency and no need to restrict credit in any way. By the end of the year imports were beginning to decline, which decreases the risk of the general recession affecting the banks' reserves to any serious extent.

Europe. Banking has been affected both by the trade recession and also by the heavy international movements of funds due to the political apprehensions of the year. There was some expansion in French bank deposits, particularly at the time of the May repatriation movement. The Bank of France has maintained its gold reserves almost intact, and indeed their revaluation in November raised them from Frs. 55,808 to Frs. 87,264 millions. Sufficient information is not yet available to see how the French banking system was affected by the autumn movements of funds due to the crisis, but the crisis itself caused a sharp increase in the note circulation due both to government emergency expenditure and borrowing, and the rediscounting at the Bank of France. As expansion in the note circulation was indeed an experience common to most European countries during the crisis, Holland was one of the countries to experience an influx of funds, the Netherlands Bank's reserve rising by about Fl. 60 millions during the year. The Belgian National Bank transformed part of its foreign exchange holdings into gold, but lost slightly on balance. Conditions in Belgium varied considerably during the year, being influenced by occasional reports that the belga would have to be devalued. The Scandinavian central banks all became stronger during the year. In Denmark the trade balance improved sufficiently to enable the authorities to augment their foreign exchange holdings. In Central Europe the alteration of frontiers created numerous banking problems. In Germany the attempt was made to get rid of concealed borrowing by means of the issue of bills rediscountable at the Reichsbank. Instead "delivery bills" were issued to contractors and others, and these were not freely rediscountable. One of the motives, doubtless, was to force the commercial banks to pay greater heed to their own cash reserves, but the main consequence was a partial immobilization of the working capital of many industrial firms. This was one cause of the August slump on the Berlin Bourse. Nevertheless, both the note circulation and the Reichsbank's bill portfolio increased substantially during the year. The increased needs of rearmament apparently were too much for the desire to rely solely upon taxation and disclosed borrowing. The new attempts to develop trade between Germany and South-east Europe, in some respects equivalent to the creation of a "Reichsmark area", have also called for numerous banking moves. (N. E. C.)

United States. The number of banks was only slightly reduced by failures, liquidations, or consolidations from 15,393 on Dec. 31, 1937, to 15,287 on the latest date for which figures were available at the end of 1938. Of this number, 563 represent mutual savings banks, which showed no change in total number during the period. The number of the above banks which are members of the Federal Deposit Insurance Corporation decreased from 13,795 to 13,723 and their total assets increased from $54,221,369,000 to $54,364,953,000 in the same period.

To counterbalance the contraction in excess reserve balances extending from 1937 into the early part of 1938, the U.S. Treasury released inactive gold on April 14 to the extent of $1,392,000,000 and the Federal Reserve Board reduced reserve requirements so as to increase excess reserves by $750,000,000. After reaching a maximum of about $3,500,000,000, excess reserves stood at $3,070,000,000 on Dec. 28, 1938. (*See* also FEDERAL RESERVE SYSTEM.) As a consequence of these measures, of large imports of gold, and of the expenditure of Treasury balances with the Reserve banks, there was an increase in excess of $2,000,000,000 in bank deposits which was, however, accompanied by a further decline in the turnover of deposits. The volume of both demand and time deposits neared the all-time peak while the ratio of the amount of cheques drawn against deposits over a period to the average volume of deposits during the same period reached the lowest point on record, reflecting the lower level of security market and general business activity as well as the large volume of idle funds awaiting profitable use.

While loans and investments declined during the first half of the year and increased thereafter, there was little net change for the year as a whole. Commercial loans declined about 20 per cent and loans to brokers and dealers in securities declined about 40 per cent. On the other hand, holdings of government direct and guaranteed obligations increased by about 7 per cent and other securities about 10 per cent. An unprecedented volume of cash resources in excess of $10,000,000,000 remained in the hands of reporting member banks.

Bank earnings suffered from the replacement of commercial loans by government securities, lower interest rates, and the large amount of funds uninvested yet subject to the $\frac{1}{12}$ per cent contribution to the Federal Deposit Insurance Corporation. Earnings from current operations were 10 to 15 per cent less, while profits derived from the sale of securities were larger. Current expenses showed a decline, reflecting efforts to economize to meet reduced income. Banks continued to increase receipts from service charges on deposit accounts, and more attention was given to the earning possibilities of other services, including trust and agency departments. Personal loans, and the financing of automobile and other purchases grew in volume, particularly on the Pacific coast.

In June there was an announcement of liberalized rules governing bond purchases by member banks of the Federal Reserve System. In addition to such securities as had been previously authorized, member banks may henceforth purchase investment securities of sound value issued by established businesses that can demonstrate the ability to service such securities, without requiring that the securities be offered for public distribution or be readily marketable, provided that they mature not later than ten years and 75 per cent of the principal be amortized by maturity through substantial periodic payments. Other changes will encourage banks to place more emphasis on intrinsic value than on liquidity or early maturity. Uniform bank examination practices were for the first time agreed upon by the three Federal examining agencies, the Federal Reserve Board, the Comptroller of the Currency, and the Federal Deposit Insurance Corporation, and co-operation is expected from the National Association of Supervisors of State Banks.

Branch banking *v.* unit banking was again to the fore in the annual convention of the American Bankers Association. The election of a vice-president, who will be president in 1940 by traditional rotation, was made the battle-

ground between the group supporting in some degree branch banking and other developments to meet changing economic conditions, and the group of militant individualists typical of the early history of American banking. The former group elected their candidate, indicating to some extent a recognition of new forces in the field of banking.

Suggestions were current for various plans to discourage interbank deposits, the most recent being a proposal to require the member banks to maintain with the Federal Reserve Banks a 100 per cent reserve against deposits of other banks. Such action would tend to add to Federal control of the banking system and would raise serious problems affecting both the large city banks where such deposits are now held in large volume, and the country banks which maintain balances with correspondents in the large cities for convenience in making transfers and in return for other valuable services of a less tangible nature. (*See* also BUSINESS CYCLES; EXCHANGE RATES; FINANCIAL REVIEW; SAVINGS BANKS.) (E. B. L.)

BANK OF ENGLAND. During 1938, the Bank of England had to manage on behalf of the government the monetary affairs of the nation under conditions of trade recession and intermittent crisis. More precisely it had to maintain the official policy of cheap and plentiful credit, and at the same time cope with the special problems which from time to time arose. To appreciate its task, it must be remembered that the effective determinant of the supply of credit is the volume of bankers' deposits in the banking department—*i.e.* the cash held by the commercial banks on deposit at the Bank of England. The size of bankers' deposits is in practice governed by the total resources of the banking department less those deposits held by various government departments and known as public deposits.

The first task of the Bank was to keep its "total resources" constant. As the table shows, it did so, at a level of just under £180 millions. The procedure was to counteract any variation in the Reserve (due in turn to variations in the note circulation) by expanding or contracting the banking department's holdings of government securities. Public deposits were less susceptible to control, and were liable to undergo sudden expansions at a time when the Exchange Equalization Account (*see* EXCHANGE EQUALIZATION FUNDS AND GOLD MOVEMENTS) was selling gold heavily and receiving sterling in exchange. On these occasions the Bank had to re-invest the Accounts cash in Treasury bills, many of which were bought in the open market. But this process often required a few weeks' time, and in the interim public deposits ran high, while bankers' deposits ran low.

This happened in May, as the result of the sudden repatriation of funds from England to France. The table shows how public deposits jumped up from £10·7 to £36·6 millions in a single week. Purchase of bills eased the position, but the *status quo* was not finally restored until the depletion of public deposits in early June as the result of the War Loan dividend payment.

The September crisis provided a prolonged period of strain. First there was the Exchange Accounts heavy gold cover, which as in May inflated public deposits. The peak here was reached on Sept. 7, for from then onwards official purchases of bills began to catch up with the gold sales. But a new problem arose at the end of the month with the crisis expansion in the note circulation. This was due to a variety of causes, including emergency spending by the government and the public and also the desire of the commercial banks to reinforce their local currency reserves.

* In banking department only

To meet their expansion and the consequent drop in the Reserve, the Bank of England bought bills on its own account, and so maintained its "total resources" at their customary level.

October and November witnessed further intermittent flights of funds to New York and gold sales by the Exchange Accounts. Public deposits, therefore, were again inclined to run high, while bankers' deposits were on the low side. The process of rectification by means of bill acquisitions on behalf of the Exchange Account had to be continued. At this time, too, the Bank had to carry out the duty of granting the £10 millions credit to the Czech government, it being understood that the Bank was to be reimbursed out of public funds so soon as the necessary legislation was passed. In consequence the Bank return of Nov. 5 showed an increase of £6 millions in discounts and advances, representing drawings against that credit.

Bank rate remained unchanged at 2 per cent during the year, and except during the crisis week of September, short money and discount rates remained very low. This shows that, in spite of the year's anxieties and disturbances, the Bank of England successfully maintained the government's policy of cheap and plentiful credit.

Early in 1939 the Bank sold £200 millions of gold to the Exchange Equalization Account, in order to reinforce the latter's resources. In consequence the fiduciary note issue was raised to £400 millions. (N. E. C.)

BANK OF FRANCE. During 1938 the Bank of France was charged with two familiar duties. The first was that of meeting the needs of a depleted Treasury, under conditions which, with one or two exceptions, precluded any borrowing in the Paris markets. The second was that of maintaining some degree of stability for France's internal and external monetary affairs. Up to April 14, when M. Daladier assumed office, both these duties weighed particularly heavily upon the Bank. The limit of permissible government borrowing had to be extended, and the total of "provisional" loans rose from Frs. 31·9 to Frs. 40·1 milliards. Meanwhile, the French Exchange Fund was losing gold in defence of the franc, and in February it had to take back from the Bank of France the Frs. 3,000 millions of gold it had transferred to it only the previous November. These and other movements are shown in the table.

The creation of the "Daladier" franc (at Frs. 179 to £1) in early May caused a sudden repatriation of capital to France. This replenished the Exchange Fund's gold, while the improvement in the atmosphere permitted of the flotation of a Defence Loan of Frs. 5,000 millions. Thus the

Bank of France Returns

Bank of France had a relatively easy time until the September crisis The nervousness of that month, however, had two consequences to the Bank, apart from the fresh efflux of capital and gold which affected the Exchange Fund. First there was a general desire to hoard currency, and also some increase in the public's expenditure as the result of the emergency. This led to the expansion from Frs. 101·8 to Frs. 124·4 milliards in the note circulation, and also to heavy rediscounting at the Bank. Next the Treasury had to borrow afresh in order to cover its emergency expenditure, and so provisional loans rose to Frs. 50·1 milliards

After the crisis there was some amelioration, as is shown by the drop in discounts, provisional loans, and the note circulation. Meanwhile the creation of the Daladier franc in May had not so far been accompanied by a revaluation of the Bank of France's gold. This was effected in November, as part of M. Reynaud's financial programme. Briefly the Bank's gold was revalued from a basis of 43 milligrammes to one of 27·5 milligrammes of gold, nine-tenths fine, per franc. This wrote it up from Frs. 55·8 to Frs. 87·3 milliards. The profit from this revaluation was allocated to the redemption of the Bank's provisional loans to the Treasury, the Treasury simultaneously borrowing up to the remaining margin of its powers. The Bank's permanent loan to the Treasury was also raised to Frs. 10 milliards. This gave the Treasury about Frs. 11 milliards of new money, to carry it over the next few months and part of this money was lodged in the Treasury's own account (public deposits in the table) and the remainder in various government funds, which rank as private deposits. The recovery in confidence and the repatriation of capital which followed the new financial and economic programme gave the Bank a far easier passage during the closing weeks of the year. (N. E. C.)

BANKRUPTCY. The year 1938 witnessed a considerable recession in both the export and internal trades of Great Britain as compared with 1937.

In consequence of this set-back in the volume of industrial activity, taken in conjunction with foreign political unrest, an increase in the number of failures during the year might have been expected, more particularly as statistics of total failures for each year from 1913 to 1937 tend to show an increase during periods of reduced activity, good examples being the years 1923, 1924, and 1931, when in each case the total failures for the year rose to over 8,000.

The total number of bankruptcies for 1938 fortunately does not reflect such an increase, though certain areas, notably connected with export trade, do, however, register a set-back. Currency and other trade restrictions have no doubt influenced the volume of trade in these areas, and thereby accentuated the number of failures. Examples of these are Yorkshire and the woollen district, where the number of failures in the wholesale section increased from 21 in 1937 to 32 in 1938, and the hardware districts of Birmingham and Sheffield, where there was an increase of nine over 1937 to a total of 31.

The total failures in the United Kingdom and Ireland during 1938 amounted to 5,550 as compared with 5,579 for 1937, an improvement of 0·52 per cent. Of this total 2,113 were under deeds of arrangement.

The largest number of failures occurred in the following occupations:

1. Builders 511
2. Grocers and Provision Dealers . . 442
3. Farmers 325
4. Drapers and Hosiers 228
5. Private Persons 228
6. Wireless Dealers 170
7. Plumbers, Painters, and Gas Fitters . 168

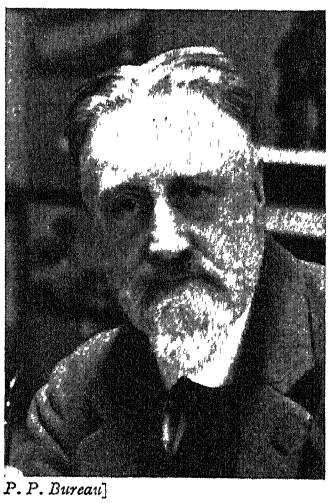
whilst the distribution of failures according to trade or profession was as follows:

	Bankruptcies	Deeds of Arrangement	Total	Per cent
Wholesale .	216	225	441	7·9
Professional .	434	74	508	9·2
Retail . .	2,787	1,814	4,601	82·9
	3,437	2,113	5,550	100·0

In view of the large concentration of population in the area, the failures in the wholesale trades were predominantly in the London district. This area accounted for 44·7 per cent of the total failures in this category as compared with 47·5 per cent in 1937.

Amongst the businesses in which there were no failures during 1938 may be noted in particular Bankers, Brewers, Cement Manufacturers, Corn Millers, and Sugar Refiners. (C. P.)

United States. The year 1938 was made eventful by the first comprehensive revision of the Bankruptcy Act since its passage in 1898. This was accomplished in the enactment by the 75th Congress of the so-called Chandler Bill (H.R. 8046), approved by the President on June 22.



Quantitatively the larger part of the amendatory Act is addressed to refinements in arrangement and phraseology, clarification and increase in definitions, and the resolution of statutory and decisional inconsistencies. Of a more substantive nature are the new sections relating to partnership and stockbroker bankruptcies, priorities, and preferences. The Act now encompasses limited partnerships, and joint petitions are permissible by or against a partnership and one or more of the partners. In stockbroker bankruptcies greater equality in the distribution of assets is approximated by legislative restriction upon priorities hitherto permissible under *Richardson* v. *Shaw*, 209 U.S. 365.

In its procedural aspects the amendatory Act enlarges the summary jurisdiction of courts; relaxes the conditions upon which receivers may be appointed and removed, and increases their powers; and makes clear the subordinate role of ancillary proceedings. The administration of estates

is otherwise improved by provisions for pre-trial examination of bankrupts and for discovery, interrogatories, and production of documents. References may now be made before as well as after adjudication to referees, who may exercise, with rare exceptions, all the powers given to the "court", and are newly endowed with powers to grant, deny, or revoke discharges, and to confirm or set aside arrangements and wage-earner plans. A further noteworthy change in bankruptcy procedure is to be found in the newly-simplified provisions establishing appeals as of right where $500 or more is involved.

Perhaps the major contribution of the new Act is its thorough-going revision, in Chapter X, of the former Section 77B dealing with corporate reorganizations. The new chapter provides a number of fundamental improvements directed in the main to increased protection of public investors in re-organization cases.

BANTOCK, SIR GRANVILLE (1868–), British musical composer, was born in London and after training for the Indian civil service, later for chemical engineering, finally took up music at the age of twenty and entered the Royal Academy of Music. His voyage round the world six years later as conductor of George Edwardes' Gaiety company helped to stimulate that interest in Oriental and pagan music which has influenced a great deal of his work, though English, Scottish, and Irish folk-songs formed the groundwork of many of his later compositions. His belief that music should express some phase of human feeling prevented him from being drawn into any of the extreme modernist schools that merely experiment in acoustics for their own sake, and he developed instead an original, somewhat cosmopolitan style of his own, excelling chiefly in orchestral colouring, which has earned him a place in the front rank of British composers. Knighted in 1930, he left Birmingham University in 1934 as emeritus professor and is now chairman of the Trinity College of Music. His best orchestral work appears in *Omar Khayyám*, the *Hebridean Symphony* and *The Great God Pan*. Among his more recent works are *Prometheus Unbound*, *Pagan Symphony*, and *King Solomon* (commemorating the coronation of George VI); and in July 1938 was heard for the first time, in Liverpool, his music for a children's play, *Fairy Gold*, dealing with the Druids of Wales. Further details of his early career, and an appreciation, may be found in the *Ency. Brit.*, vol. 3, p. 79.

P. P. Bureau]
SIR GRANVILLE BANTOCK

BAPTIST CHURCH, THE. In the British Isles the aggregate membership of the Baptist Churches in 1938 was returned as 392,538, with 3,224 churches and a total seating accommodation of 1,439,687. This shows a decrease of 3,996 members, but an increase of 22 churches. Sunday Schools have 401,906 scholars. Scotland, Wales, and Ireland all have their own national Unions which work in close and friendly relations with the largest body, the Baptist Union of Great Britain and Ireland (president, the Rev. F. J. H. Humphrey, D.S.O.; general secretary, the Rev. M. E. Aubrey, C.H.). The annual assembly was held in London in April 1937, when the Rev. P. T. Thomson was elected president for 1939–40.

The Forward Movement inaugurated by the Union is successfully achieving its purpose of raising a million pounds to be spent in ten years on new buildings in recently developed residential areas to which one-quarter of the population has migrated since the War. Notable in the work of the Union is its increasing organization of women through the Baptist Women's League with its more than 700 branches, and of young people who maintain close contacts with Baptist youth on the Continent of Europe and in America.

British Baptists, in common with other Churches, are affected by the general unsettlement of life and thought, but are steadily and confidently adjusting themselves to the new conditions. They are linked to their fellow Baptists throughout the world, a steadily growing community, through the Baptist World Alliance which serves some twelve million communicant members and from thirty to forty million adherents in 72 countries.

In the Empire Baptists have made gratifying progress, and their membership, outside the British Isles, has reached 343,833. In 1938 in Jamaica they celebrated the centenary of the liberation of the slaves, in which Baptist missionaries played a large part, and in South Australia that of the beginnings of Baptist work in that land. In the East an All-India and Ceylon Baptist Union (including Burma) was formed, and it will be inaugurated formally early in 1939.

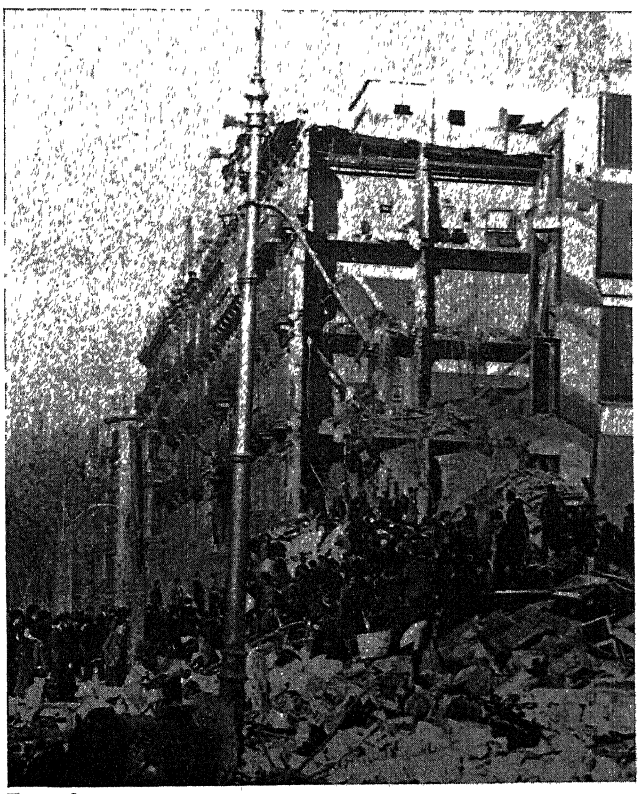
Foreign Missions. The Baptist Missionary Society (founded by William Carey, 1792) has 425 European missionaries working in India, Ceylon, China, Africa, and Jamaica. Its highest record of baptisms last year was in Congo, where the mission has extended rapidly. Its educational work at Serampore, Bengal, and at Tsinanfu, North China, is of university standard, and it does a large medical work. Two new hospitals are now being built. It maintains its early tradition through its linguists, translators, and writers of vernacular literature in all its fields. The expenditure last year was £169,700, with a deficiency of £17,778. (M. E. A.)

United States. The Baptists of America, totalling 10,370,980 members, are divided into two main bodies: the first, three groups with 9,860,290 members; the second, fifteen miscellaneous groups with 510,690 members. In the first division the Southern Convention has 24,844 churches and 4,595,602 members; the National (coloured) 24,000 churches and 3,796,645 members; the Northern 7,603 churches and 1,468,043 members.

Each Convention took action respecting certain social problems, both affirming their belief in democracy. Through its Social Service Commission the Southern condemned "all violence on the part of labour or capital", commended the action of various states to regulate child labour, but criticized the proposed Child Labour amendment to the Constitution.

The Northern Convention supported all pacific means for settling international disputes and opposed competition in armaments. Both Conventions urged the complete separation of church and state.

Both Conventions also appointed representatives for the Utrecht Provisional Conference of 1938.



BARBADOS. Sir Mark Young left in March 1938 and was succeeded as Governor by Mr. E. J. Waddington in August. The new Colonial Secretary, Major Flinn, arrived in September. A record area of 15,097 acres of cane was reaped. An expedition to Brazil was authorized to collect the Amazon Fly as a parasite to control the cane moth borer.

To supplement the staple crops of sugar and cotton, the Department of Agriculture gave much attention during the year to the development of minor crops, including fruits and arrowroot. Exceptional rainfall in November culminated in destructive landslides in the hilly parishes.

The Royal Dutch Airline made successful reconnaissance flights for a new mail service connecting the Colony with Trinidad, Aruba, and Curaçao. The annually increasing population, with present density of 1,114 per square mile, led to an emigration scheme, 700 labourers being settled in St. Lucia. Provision was made for erecting 28 elementary schools and improving the Lodge School. Following the Disturbances Commission's Report, a Labour Officer was appointed and a Minimum Wages Act was passed. (A. A.)

Area and Population :
Area 166 sq. miles.
Population (Dec. 31, 1936) 188,294.
Chief Town, Bridgetown (pop. 54,234).
Governor. E. J. Waddington, C.M.G.
Production. Sugar (1936), 129,256 tons.
Overseas Trade 1937 :
Imports, £2,220,650.
Exports, £1,646,709 (domestic £1,498,341).

BARCELONA. The city remained during 1938 the headquarters of the Spanish republican government, though preparations were made for removing the administrative centre to Valencia in the event of the insurgent forces' appearing likely to capture Barcelona. It has been subjected to constant bombing raids by Gen. Franco's air forces, particularly in January, March, October, and November. It was officially announced in February that, as the result of a year of aerial attacks, 925 persons had been killed in the city and 2,349 injured, while 900 houses had been damaged or destroyed ; on March 16–18, a series of raids carried out on the centre of the city caused over 800 deaths and 2,200 serious injuries The city's defences were thereafter considerably improved, and by November it was estimated that 2,000 bomb-proof shelters were available, giving protection to about 600,000 persons—about one-third of its population, which by then had swollen to nearly two millions On April 7 the insurgent forces captured the hydro-electric station at Tremp, which supplied most of the electric power for Barcelona's lighting, transport, and industry. The tube railway was much utilized as an air-raid shelter, some families attempting to camp permanently therein. As a preventive measure against typhus, dogs were prohibited from appearing in the streets, even if muzzled.

SEARCHERS WORKING TO RECOVER BODIES FROM THE DEBRIS AFTER THE AIR-RAIDS OF MARCH 16, 17, AND 18 OVER BARCELONA

BARLEY : *see* GRAIN CROPS.

BARODA is a Mahratta State in Western India, its territory of 8,164 sq. miles being much intermingled with British districts. M. R. Sir Sayaji Rao Gaekwar rules over it and its dependencies, the total population being 2,443,007. Baroda has always claimed to be one of the most progressive of the Indian States, especially in education. Its capital, Baroda (population 112,860), is well laid out, with imposing buildings—college, museum, and market-place. The British Resident (Col. E. J. D. Colvin) is also agent to the Governor-General for a group of adjoining Gujerat States (7,541 sq. miles, pop. 1,272,168), of which Cambay and Rajpipla are probably best known. (ME.)

BASEBALL. The early part of the year 1938 saw the formation of the International Baseball Federation, of which England and some twenty other nations are members.

After several months of earnest preparation the season in Britain opened on May 1 with a great fillip, and the enthusiasm in all parts of the country was unprecedented. In all some 750 teams took to the Diamond with real interest and enthusiasm.

With the great increase of teams new leagues were formed and existing leagues formed additional divisions, while the attendances at games were greatly increased, and several clubs were obliged to find larger grounds to accommodate their supporters.

The outstanding event in Britain was the promotion of a series of test games, England *v.* America, by the International Federation. During August an American Amateur Team selected from thirty-four states of America visited the country for the purpose, and five test games were played at Liverpool, Hull, Halifax, Rochdale, and Leeds, which resulted in a win for England, by four games to one. Earlier in the season a representative team of the U.S. navy toured the country, playing games as far afield as Yorkshire and Liverpool, and again much interest was aroused by this visit.

An exciting challenge game, Lancashire *v.* Yorkshire, was the subject of a running commentary by the B.B.C. on August Bank Holiday, when after playing twelve innings (the maximum in Britain) the result was a draw.

The Royal Air Force played no mean part in extending the popularity of the game, and several stations in all parts of the country adopted baseball, in addition to the many stations who had been playing during 1936 and 1937.

Sports, social, and factory clubs took to the game in real earnest, and it is reported from all areas that the season concluded very successfully. In addition to the league competitions, numerous entries were received for the

National Challenge Cup Competition, and the various District Challenge Cup Competitions

Popularity of the game with scout troops, schools, and boys' clubs rapidly increased, and some 200 applications for entry to the National Juvenile Trophy Competition were received. This was a new competition promoted for junior teams whose players were seventeen years of age and under. Several junior leagues were formed to accommodate these teams.

A league for women, with a membership of eight teams, was very successfully promoted in Hull, and numerous other women's teams were to be found dotted about Britain.

Indoor schools were promoted and held in most areas for the training of players and umpires.

Thus British baseball, under the control of the National Baseball Association, concluded in September its most successful season.

In the United States the world's championship was won by New York Yankees (winners of the American League), who beat Chicago Cubs (winners of the National League) by 4—0. Kansas City won the Little World Series, and the Eastern Inter-collegiate League finished with Dartmouth at its head. (G. K. E.)

BASUTOLAND. The territory, which is legally a British Colony, is administered by a resident Commissioner under the High Commissioner for South Africa Since 1903, a National Council replaced the traditional "pitso", or tribal gathering, for the purposes of discussing domestic affairs. The chief problem is the improvement of agriculture and animal husbandry. Anti-erosion measures are financed from a loan of £160,233 from the Colonial Development Fund, and a detailed geological survey is financed from the same source. Nearly 50,000 natives leave the territory annually to work in the Union, and as many as fifty per cent of adult males are away from the territory at one time. In the political field the question of transfer to the Union arouses keen interest both within the territory and elsewhere. In March 1938, Mr. MacDonald announced that an agreement had been reached between the Imperial Government and the Union to constitute a joint advisory conference to study openings for co-operation. The Union has also agreed to prepare memoranda setting forth the terms on which transfer might take place. (J. L. K.)

Area and Population :
Area 11,716 sq. miles.
Population (1936 Census): Whites, 1,434; Coloured, 560,877.

Finance 1936–37 :

Revenue, ordinary	£332,553
Expenditure, ordinary	£300,342

BAUER, OTTO, Austrian politician, was born in Vienna in 1881, and died in Paris on July 4, 1938. A biographical notice of him may be found in the *Ency. Brit.*, vol. 3, p 226. He kept his position of power among the Austrian Socialists until 1934, when he had to take refuge in Czechoslovakia as a consequence of the clash between the Socialists and Dr. Dollfuss. After leaving Austria he wrote *Between Two World Wars*. In the spring of 1938 he found it necessary to leave Czechoslovakia for Paris.

BECHUANALAND PROTECTORATE. The country is sandy and waterless, inhabited by pastoral tribes, the principal being the Bamangwato, under Chief Tshekedi Cattle raising is the chief industry, but some forty per cent of the adult males are absent from the territory at work in the Rand mines. Proclamations of 1934 introduced a system of native administration involving a limited form of indirect rule: the policy of both maintaining the customary rule of the Chiefs unimpaired and at the same time introducing more progressive administration involves considerable difficulty The right to regulate the appointment and dismissal of Chiefs was unsuccessfully contested in the Courts by Tshekedi. Gold mining is carried on in the Tati district. (J. L. K.)

Area and Population :
Area (estimated) 275,000 sq miles
Population (1936 Census): Europeans, 1,899, Coloured, 263,857
Production 1937 :

Railways, 396 miles.
Finance 1937–38 :

Revenue, ordinary	£179,124
Expenditure, ordinary	£182,052

BECK, JÓZEF (1894–), Polish soldier and statesman, foreign minister since Nov. 2, 1932, was born in Warsaw and brought up to the ideal of Polish independence. His father, a lawyer and under-secretary of State, was forced by Russian persecution to settle in Austrian Poland, hence the son was educated in Cracow, Lwów, and Vienna.

Vandyk
COLONEL JÓZEF BECK

In 1914, Józef Beck joined Piłsudski's Polish Legion, on the disbandment of which he escaped to the Ukraine and in 1918 took an active part, under Śmigły-Rydz, commander-in-chief of the secret military organization, in the struggle for independence. In the Polish-Soviet war, 1919, he commanded a battery of field-artillery, served on the General Staff, and headed a military mission to Rumania, becoming, after the war (1922–23), military attaché in Paris.

After the *coup d'état* of May 1926, Beck was appointed Piłsudski's chief of the secretariat, and when the latter became prime minister (1930), was nominated vice-premier, later in the year becoming under-secretary for foreign affairs. His history, since becoming minister in 1932, is that of Poland (*q.v.*), and is marked by his success in avoiding entanglements and in keeping his country free from aggression either from the east or the west, and by his satisfactory settlement in Aug. 1938, of the eighteen-year-old Polish-Lithuanian dispute.

Colonel Beck married the divorced wife of General Burckhardt-Bukacki; there are no children.

BÉDIER, JOSEPH, French scholar, was born in Paris on Jan. 28, 1864, and died on Aug. 29, 1938. He spent his early years in Réunion, and after his return to France became known as a leading authority on French mediæval literature. In 1920 he was elected a member of the French

Academy, and from 1929 to 1936 was administrator of the Collège de France. Bédier's best-known work was his adaptation of *Le Roman de Tristan et Iseult*, published in 1900; and among his other publications were *Les Chansons de Croisade* (1909), *Commentaire de la Chanson de Roland* (1924), and also *Les crimes allemands d'après les témoignages allemands* and *L'effort français*, both engendered by the World War.

BEE-KEEPING. There are, unfortunately, no official statistics as to the number of bee-keepers, the number of stocks they own, or the amount of honey produced in Great Britain, so all estimates are a matter of conjecture, based on what information may be obtained from various sources. The number of bee-keepers in England and Wales is probably about 35,000, the number of stocks of bees 140,000, and the amount of honey produced in a normal season is on an average about 50 lb. per hive. In 1938 the honey harvest was very poor, averaging from 25 to 30 lb. per hive, only about half the normal yield. But although the quantity was small the quality was on the whole excellent, much better than that of 1937. Two other features were noted in 1938; swarming was more prevalent than usual, and bees were generally more inclined to use their stings.

In Scotland it is estimated there are about 30,000 stocks of bees. As in England, the season in 1938 was not good, the average for the whole country being about 25 lb. per hive. (J. H-H.)

Colonies of bees in the United States in 1938 numbered 4,500,000 (Department of Agriculture estimate). Annual production of honey is about 160,000,000 lb., with the 1938 crop estimated as about 15 per cent larger. Average production per colony is less than 40 lb., but in North Dakota the average, from sweet clover, runs close to 100 lb Bee-keeping is the most widely distributed agricultural enterprise in the United States and is a $10,000,000 industry. Industrially, honey enters into the manufacture of cosmetics, cigarettes, tobacco, golf balls, shaving cream, wax candles, polishes, and insulation.

In Canada, honey exports for the eight months ending March 31, 1938, were 2,541,400 lb., compared with 2,296,200 lb. for the same period in 1937, in which year total production was 21,733,200 lb., the 1938 crop being slightly larger. Canadian imports of package bees from the U.S. rose steadily from $52,000 in 1932 to $193,300 in 1937.

BELGIAN COLONIAL EMPIRE. Total area, 960,000 sq. m.; Total population (est. Dec. 31, 1936), 21,898,000.

The following table gives essential statistics relative to Belgium and the colonial and mandated territories administered by her:

BELGIAN CONGO, THE. A progressive native policy is combined with an economic policy involving the close association of the government with large industrial and agricultural undertakings, which in their turn undertake extensive social work among their native employees The government educational programme is carried out by the "Missions Nationales", mostly Roman Catholic, and health work is also in the hands of private organizations A system of compulsory cultivation of marketable crops is in force to encourage native agriculture. Native administration has many characteristics of the British system of "indirect rule" (*see* COLONIAL POLICIES), and special attention is paid to native local government in urban areas The administration of the country has been described as showing the greatest possible contrast to that of the Congo Free State.

The budget bears heavy debt charges, and subventions are made by Belgium to balance accounts; in 1938 this subvention will amount to about fifty million francs.

In addition to the important copper mines, the Chinkolobwe mine in the Katanga is one of the chief sources of the world's supply of uranium. Communications are being rapidly improved by the extension of a network of motor roads, and the Benguella railway provides an additional outlet to the west coast. Air transport, linking the territory with Europe, plays an increasingly important part. Measures are being taken to increase the number of native troops and to create a colonial air force. (J. L. K.)

BELGIUM. Events in central Europe aggravated a financial situation already foreshadowed as serious in 1937, and then ascribed to economic causes, such as customs barriers. In March, Dutch, Swedish, and Swiss banks granted a loan. Eastern frontier fortifications were strengthened and (in September) manned. In March, M. Spaak (then foreign minister) noted the failure of the League of Nations and Locarno, saying : " I cannot base the policy of my country on an ideology in complete decline ". In April, he announced that there could be no question of admitting wholesale political refugees, especially Jews from Austria and Germany ; Belgium favoured the American proposal for a conference on the subject in Switzerland. In view of an emergency budget with a deficit put, in April, at £12,000,000, estimates, except for defence and social services, were curtailed, but additional taxation appeared inevitable. Later, depreciation of the French franc caused grave concern. Over ways and means there was a critical debate early in May. The subsequent vote of confidence did not avert a cabinet crisis. On May 12 the Catholic Conservative members withdrew their support, the cabinet fell, and King Leopold, returning by air from the Hague, charged M. Spaak to form a ministry. This he did (May 13), becoming Belgium's first Socialist premier. The new cabinet (eleven as against fifteen) included three Catholic, four Socialist, and two Liberal members. Simultaneously, the bank rate was raised from two to four per cent. In July the net deficit was quoted as £3,500,000, and in September this was reduced by special powers laid before parliament. In March, the question of diplomatic recognition of the Italian empire over Abyssinia having shaken the cabinet, the appointment of an ambassador was announced. Similar recognition of Spain's Burgos regime (December) provoked Barcelona, and M. Spaak's Socialist supporters grew restive. But he stood firm, reconstructed the cabinet on a broader basis (already M. Albert Janssen had succeeded M. L. Gérard as finance minister), and, at the end of the year, could leave for a short informal visit to Paris. A credit of £4,400,000 for Air Raid Precautions was asked for. As a result of King Leopold's visit to the Netherlands (November) the old Hanseatic ideals revived. Meanwhile, M. van Zeeland had completed his economic investigations in European capitals and America, undertaken at the invitation of the British and French governments, his report recommending measures for removing international trade barriers. In October he left for a further two months' tour, travelling to America *via* England. A sign of the times at home was the foundation (March) of the Royal Flemish Academy of Sciences, Letters, and Fine Arts. King Leopold laid a foundation-stone (March) at Liége for the 1939 Water Exhibition ; unveiled (May) a rose-window in Ypres cathedral to the memory of King Albert, presented by the British Army and Royal Air Force ; and attended in Paris, with other members of the royal family (October), the unveiling of a statue of King Albert. Another memorial to the late king, given by ex-Service men, had been unveiled at Nieuport in July. In the October municipal elections the Rexists failed. (H. Fw.)

BENEŠ, EDUARD (1884–), former President of Czechoslovakia. Accounts of Dr. Beneš will be found in the *Ency. Brit.*, vol. 3, pp. 402–3, and in *The Book of the Year*, 1938, p. 98. A lifelong Socialist, a brilliant linguist and conversationalist, and a great traveller, he was president from Dec. 18, 1935, until Oct. 5, 1938, when, owing to the new conditions arising from the signing of the Munich Agreement and to the concentrated German attacks upon him, he resigned his office, realizing that his continuance in it would be a hindrance to his country's reaching an understanding with Germany and Italy. In his broadcast

farewell he said: "As a convinced democrat I think it better to go. We remain democrats, and we shall try to continue to work with our friends, but my resignation is imperative in order to accommodate our State to the new circumstances. . . . I do not leave the ship because it is stormy, but because it is a political necessity".

His history during 1938 belongs to the story of Czechoslovakia (*q.v.*), but it may be mentioned here that an important interview with him appeared in the London *Sunday Times* a week before the *Anschluss*, in which he refused to admit the interference of a foreign nation in the affairs of his country, spoke of the possible inclusion of Henlein (*q.v.*) in the cabinet, and stressed his desire for a good understanding with Germany. Further, in April, in token of his conciliatory attitude, he signed an amnesty freeing nearly 2,900 of his 4,200 political prisoners awaiting trial or serving sentences. His reception of Lord Runciman (Aug. 29), his long meeting with the Sudeten leaders, Kundt and Sebekowsky (Sept. 2), his conciliatory broadcast from Prague (Sept. 10), and his later broadcast (Sept. 22) on the resignation of the cabinet were also notable events.

Dr. Beneš, who had formerly been a professor at Prague, now received invitations from many foreign universities, including one to stand for the rectorship of Glasgow, and eventually accepted one from Chicago, where he will lecture on democratic institutions. On Oct. 22, accompanied by his wife and a small secretarial staff, and in broken health, he left his country by air, to rest in England for some weeks before proceeding to America.

BENGAL PRESIDENCY. This province has had a busy year. The Governor, Lord Brabourne, acted as Governor-General when Lord Linlithgow was on leave in the summer, being replaced by Sir Robert Reid, from Assam. The coalition non-Congress ministry of Mr. Fazl-ul-haq met continuous opposition from the Congress minority, but although one minister fell out and there were fierce popular demonstrations, it held its own, receiving substantial support from the European *bloc*. The chief piece of controversial legislation was a Tenancy Bill, which evoked angry but ineffective protests from the landlords; and a comprehensive inquiry, under the chairmanship of Sir Francis Floud, is to be held into the whole thorny question of the Permanent Settlement, which has been a characteristic of, and, many feel, a handicap to, the Bengal administration since the days of Lord Cornwallis. The government introduced Prohibition in one district experimentally, and have been active with plans for social service. Jute, the province's chief industry, has continued in difficulties, due mainly to the lack of world demand. In May 1938 the industry decided to order no more mill machinery, and to adjust the working hours to the market demand. Certain elements refusing to participate in joint action, the government took power to regulate conditions of work by ordinance. On the issue of an edict restricting production, 50,000 mill hands went on strike in December. Following an operation, Lord Brabourne died on Feb. 23, 1939, at the early age of 43 years. (ME.)

BERLIN. Private life in Berlin in 1938 was primarily an attempt to cope with the restrictions of the Four Year Plan (which extended even to philately and fashions), while group-life was a mirror of the international crisis. The events leading to the postponement of Hitler's "fifth anniversary" speech on Jan. 30 created much apprehension, and the celebrations were limited to a torchlight procession past the Chancellory. On March 18, Hitler spoke in the Kroll Opera House, and announced a plebiscite on the Austrian question. Berlin was singularly unaffected by the electoral campaign, and the polling-day itself, April 10, was very quiet. Even Göring's speech on April 8 fell flat, for the Berliners applied one phrase of it to themselves, "we have had blows enough". In September, however, the apathy was replaced by despair. There was less public jubilation in Berlin over the Sudetenland than over Austria, because the people realized how close war was. The partial mobilization, and especially the passage of the troops through the city on Tuesday, Sept. 27, depressed the public. Yet there was not the same emphasis on evacuation, gas masks, and open-air trenches as in London or Paris.

The year was a bad one for the Jews, if only because the minister for propaganda is also *Gauleiter* for Berlin. Sporadic outbreaks occurred in June, but the worst excesses took place on the night of Nov. 9, when huge crowds watched the wrecking of shops and the looting of Jewish property. The damage in Berlin was estimated at £11 millions. The riots increased the displacement of Jews from desirable suburbs. They had already been expelled from many residential areas to make way for the building of *Prachtstrassen* or "prestige-streets", and now they were compelled to move to the poorer districts in the north and the centre. Early in December, they were banned entirely from certain areas in the Wilhelmstrasse, the Unter den

THE LAYING OF THE FOUNDATION-STONE OF THE HOUSE OF TOURIST TRAFFIC BY HITLER IN THE RUNDEN PLATZ, BERLIN, JUNE 14, 1938, TO START HIS RECONSTRUCTION PLAN

Linden, the Kurfurstendamm, and the Vossetrasse. The aim is to remove them from all the main streets.

A general restriction of business activity occurred during the year There were numerous shortages of food—at times meat and certain vegetables, and nearly always fatty materials. After Sept. 15, the sale of cream was forbidden for the rest of the year. In October, the butter-ration was cut by a further fifth to 200 grams per head weekly; eggs were hard to find; and the Berliner was ruefully asking why so much emphasis was placed on the new "People's Radio" at 35 marks and so little on the food-shortage. This was typical of the attitude of most Berliners, other than young Nazis, during the year. They had become more querulous. (S. H. R.)

BERMUDA. The principal trade of Bermuda is the tourist traffic, and in 1938 tourist arrivals numbered 82,062, almost a record figure. Of these 52,289 arrived direct by ships in regular service from the United States, 1,133 from Great Britain, 1,098 from the West Indies, and 933 from Canada In addition, over 25,000 arrived by cruise ships. The sporting amenities were further increased during 1938 and the golf courses now number twelve. The joint air service provided by Imperial Airways and the Pan-American Line carried an increased number of passengers, who totalled 5,515 during the year. The greatest number came in August. In January a record time was set up, the journey from Baltimore to Bermuda being made in 4 hours 4 minutes.

The bulk of Bermuda's water supply is rain collected from the roofs of houses Owing to a shortage in the spring the House of Assembly voted £500 towards defraying the cost of importing drinking water from New York, 666 miles away. This was sold at $1 per ton.

A controversy arose over the question of ships being used as hotels while in the Colony's harbours, and the House of Assembly voted in favour of this practice being barred. (A. A.)

Area and Population:
Area 19¼ sq. miles.
Population (est. Dec. 31, 1937) 30,951 (White 12,143).
Governor: Lt.-Gen. Sir R. J. J. Hildyard, K C B.
Production (total value 1937). £220,475.
Tourist Trade (estimated average annual expenditure): £1,500,000.
Overseas Trade 1937:
Imports £2,183,152.
Exports, domestic, £32,321; Re-exports, £147,414.
Communications:
Roads, 105 miles; Railway, 22 miles.
Finance 1938:
Revenue £427,017; Expenditure £478,676.
Public Debt (Dec. 31, 1936), £75,000.
Education 1937. Aided private schools, 30, scholars, 4,745. Six of these schools give a secondary education.

BHUTAN is a small independent State lying on the outer Himalaya, N. of Bengal and E. of Nepal. Its capital is Panakha, its area about 18,000 sq. miles, and its population (mainly Buddhists) estimated at 300,000. In return for a subsidy of a lakh of rupees, the ruler accepts the advice of the British in his external relations.

BIHAR. This province of British India as now constituted, and including Chhota Nagpur, has an area of 69,348 sq. miles and a population of 31,371,434. The Governor is Sir Maurice Hallett, and the Cabinet is led by Mr. Shri Krishna Singh as prime minister; there is a bi-cameral legislature. In Bihar proper the population density is about the highest in India. Rice, sugar, tobacco, and all the cereal crops are grown; irrigation abounds, S Bihar being admirably served by the Son Canal system. Coal is extensively mined in the Barakar and Damodar valleys, and the Tata iron and steel works at Jamshedpur are acquiring a world-wide reputation. Under a powerful tariff, the sugar industry is threatened by over-production and inefficiency; and the local government has passed some hasty legislation to control the output, license factories, and fix a minimum price for cane. In Feb. 1938 the government of the province, which owes political allegiance to the Congress, resigned in protest against the Governor's action regarding certain political prisoners; but the crisis was surmounted, *see* under INDIA. The chief city and seat of the High Court, Patna, is also a railway centre of considerable importance; population 159,690 Adjoining it and only partially excavated, is the site of Pataliputra, known to the Greeks as the capital of some of India's greatest monarchs, including Asoka, three centuries B.C. (ME.)

BILLIARDS AND SNOOKER. During 1938, the professionals' competitive activities were confined to the Snooker Tournament promoted by a national newspaper, the World's Professional Snooker Championship, and the United Kingdom Professional Billiards Championship.

Most important of the amateur events was the Empire Billiards Championship played in Melbourne, Australia, and won, as was expected, by Australia's representative, Robert Marshall of Perth. England's representative was the national champion, Kingsley Kennerley of Birmingham, who had the satisfaction of making a new Empire record with a break of 472. Other countries represented in this Empire event were South Africa, India, and New Zealand.

The English Billiards Championship was again won by Kennerley, who, however, yielded his national snooker title to a London jeweller, P H. Matthews.

The year was remarkable for snooker achievements by the world champion, Joe Davis. He first broke his own world record of 135 with a run of 137 at Leicester, and three weeks later set up a new record with a break of 138.

The results of the more important billiards championships and competitions played during the year were as follows: United Kingdom Professional Billiards Championship: Joe Davis 20,933, Tom Newman 19,542; Women's Professional Championship: Joyce Gardner 2,313, Thelma Carpenter 1,824; English Amateur Championship. K. Kennerley 4,714, Joe Thompson 3,925; Women's Amateur

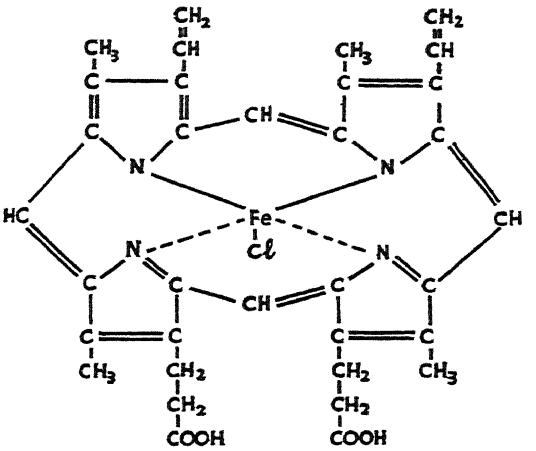
Championship · Mrs McDougall 674, Miss G M. Saunder 563 ; Scottish Amateur Championship. James McGhie 2,636, J. S. Patterson 1,989, Welsh Amateur Championship: Joe Tregoning 1,500, Bryn Gravenor 1,002 ; Northern Ireland Amateur Championship: W. Lowe 1,000, W. R Mills 846 ; Eire Amateur Championship · S. Fenning 1,000, T. O'Brien 873 ; Boys' Championship · Richie Smith 400, Alan Walker 307 ; Boys' International Championship: Scotland 5, England 1 ; Inter-varsity. Oxford 2, Cambridge 1.

The Snooker Championships and competitions resulted as follows : World's Professional Championship : Joe Davis 37 frames, Sidney Smith 24 ; Women's Professional Championship : Ruth Harrison 11 frames, Thelma Carpenter 2 ; English Amateur Championship: P. H. Matthews 6 frames, K. Kennerley 1 ; Women's Amateur Championship: Miss Ella Morris 4 frames, Miss Molly Hill 1 ; Welsh Amateur Championship : Bryn Gravenor 4 frames, Tom Jones 0. (W. G. C.)

BIOCHEMISTRY. The rate of many chemical processes is increased by the presence of traces of substances known as catalysts, which, although they may have exerted the accelerating effect by themselves undergoing a cycle of changes, reappear chemically unchanged at the end. Almost without exception the chemical changes brought about by living matter can take place outside the body only at extremely slow rates or under conditions of temperature, acidity, etc., that would be incompatible with life. In the living creature the rate of these changes is greatly increased by special catalysts called enzymes. Enzymes therefore occupy an essential and central position in that part of biochemistry which deals with the chemical changes that take place in living creatures. The year 1938 has seen important advances in our knowledge of the chemical nature and mode of action of the enzymes themselves.

Enzymes. There has been increasing agreement among workers that many oxidation enzymes are composed of a prosthetic group bound to a specific protein. The prosthetic group is of relatively small molecular weight, and is the " business end " of the enzyme molecule as far as the cycle of changes by which the enzyme exerts its catalytic effect is concerned. The protein moiety is, however, equally essential, for neither protein nor prosthetic group are alone catalytically active. The protein moiety confers catalytic activity on the prosthetic group and governs the high specificity of the enzyme for its substrate. The prosthetic group may be more or less easily separated from the protein. Thus in the case of some of the dehydrogenase enzymes (a group of enzymes which bring about oxidation by activating their substrates to donate two hydrogen atoms to a suitable acceptor) the separation may be effected by dialysis—these are the dehydrogenases that have long been known to require a coenzyme. The coenzyme is now regarded by many as the prosthetic group of the enzyme protein, recombination taking place on mixing the two components. The cycle of oxidation and reduction undergone by coenzymes I and II (mentioned in *Ency. Brit. Book of the Year*, 1938) is regarded as the mechanism by which the dehydrogenase enzyme as a whole is catalytically active. It will be noted that although a prosthetic group, *e.g.* coenzyme I, may be common to a number of dehydrogenase enzymes, the different proteins to which it is combined confer a high specificity as to the substrate attacked. The amino-acid oxidase enzymes which catalyse the reaction—



$$R.CH_2CHNH_2COOH + O \longrightarrow R.CH_2CO.COOH + NH_3,$$

are less easily split into prosthetic group and protein. The separation may be effected by precipitation with ammonium sulphate followed by dialysis. The two fractions recombine on mixing, giving full catalytic activity. The prosthetic group is a dinucleotide similar in structure to coenzymes I and II, except that flavin (dimethyl *iso*-alloxazine) replaces nicotinic acid amide (see report for 1937) as the reversibly oxidizable and reducible part of the molecule.

Catalase is an enzyme promoting the reaction—

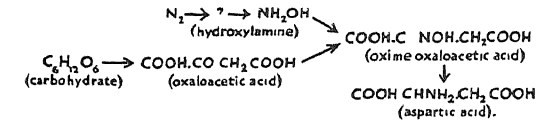
$$2H_2O_2 \longrightarrow 2H_2O + O_2.$$

By high purification of the enzyme, Keilin and Hartree have shown that the prosthetic group is an iron-porphyrin compound protohæmin :

and that the catalytic activity of the enzyme is due to the reversible oxidation and reduction of the Fe atom of the prosthetic group :

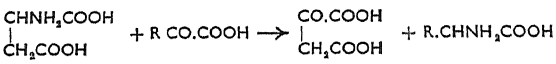
$$4Fe^{+++} + 2H_2O_2 \longrightarrow 4Fe^{++} + 4H^+ + 2O_2$$

$$4Fe^{++} + 4H^+ + O_2 \longrightarrow 4Fe^{+++} + 2H_2O.$$



A similar prosthetic group is present in hæmoglobin (the essential part of the O_2 transport system of the blood in mammals), cytochrome (intracellular H carrier), and peroxidase (which catalyses oxidation of some compounds by H_2O_2). The different protein moieties confer quite different catalytic powers on the iron atom of the hæmin.

The presence of —SH groups on the succinic dehydrogenase molecule has been shown to be essential for the activity of this enzyme (Hopkins).



The production or disappearance of bacterial enzymes in response to chemical changes in their environment has continued to receive attention, and may eventually throw light on the mechanism of enzyme formation.

Nitrogen Fixation. The economic importance of the enrichment of soil through the fixation of atmospheric nitrogen by various groups of bacteria has long been realized. The micro-organisms responsible may be divided into two groups: (*a*) free living, *e.g. Azotobacter, Cl. pastorianum*, (*b*) organisms living in symbiosis with leguminous plants (pea, bean, clover, etc.), *e.g. Rhizobium trifolium*. Largely through the work of Virtanen, great advances have recently been made in our knowledge of the chemistry of the fixation process in the case of the symbiotic nitrogen fixers. The nitrogen-fixing power of the leguminous plants is known to be associated with the presence of root nodules. No fixation occurs in the absence of nodules and no nodules are formed in the absence of bacteria. Both plant and bacterial cells are, however, equally essential for the complete fixation process. Virtanen has shown that young seedling leguminous plants fix more nitrogen than is used in the synthesis of new plant material

and the excess is excreted into the soil. By analysis of the excreted nitrogen strong evidence for the following scheme for the chemical course of nitrogen fixation has been obtained :

Nitrogen fixation by crushed nodules can take place providing that oxaloacetic acid is supplied, but there is no fixation by the bacteria alone in the absence of plant material. In the presence of plant tissue the amino group of aspartic acid can exchange with the keto group of a number of ketonic acids :

The synthesis of amino-acids other than aspartic acid can therefore take place via aspartic acid as intermediary.

Photosynthesis. Plants are able to utilize carbon dioxide as the sole source of carbon. The carbon dioxide is converted to carbohydrate and oxygen is evolved ; the energy for this synthesis is obtained from light via the pigment chlorophyll. The chemical mechanism of this photosynthesis is still obscure, but the situation has become more hopeful by the demonstration of the occurrence in the plant of complexes of chlorophyll and protein. These protein-chlorophyll compounds are stable to light, whereas solutions of pure chlorophyll deteriorate rapidly. Furthermore, the absorption spectrum of the complex closely resembles that of chlorophyll in the leaf, whilst the spectrum of pure chlorophyll extracted from the leaf is somewhat different. The possibility that such protein-chlorophyll complexes may prove to be catalytically active will be realized from the paragraph on enzymes.

Oxygen evolution by isolated chloroplasts in the presence of a chemically defined substrate (ferric oxalate) has recently been demonstrated.

Proteins. An important contribution has been made to the problem of the synthesis of protein. Such synthesis is essential to the growth and multiplication of cells, but, although a good deal is known of the enzymic breakdown of proteins, until recently nothing was known of the synthetic process. Bergman has now demonstrated that the enzymes papain and chymotrypsin, formerly regarded as being proteolytic only, can also catalyse the synthesis of the peptide linkage between some amino acids. It is necessary to " protect " the $-NH_2$ and $-COOH$ groups not involved in the peptide formation. This is done by benzoylation of the $-NH_2$ group and anilide formation with the $-COOH$ group. Thus in the presence of papain benzoyl-*l*-leucine reacts with *l*-leucine anilide forming the dipeptide derivative benzoyl-*l*-leucyl-*l*-leucine anilide.

$$\underset{\text{(benzoyl-}l\text{-leucine)}}{C_6H_5CO{-}NH.CH(C_4H_9)COOH} + \underset{\text{(}l\text{-leucine anilide)}}{NH_2CH(C_4H_9)CO{-}NH.C_6H_5}$$
$$= C_6H_5.CO.NH.CH(C_4H_9)CO{-}NH.CH(C_4H_9)CO.NH.C_6H_5 + H_2O$$

A similar reaction between benzoyl-*l*-tyrosine and glycine anilide has been demonstrated with crystalline chymotrypsin. There now seems a strong possibility that the intracellular proteinases such as papain and kathepsin may be primarily concerned with the synthesis rather than the breakdown of proteins.

Nutrition. The disease pellagra (symptoms—dermatitis, diarrhœa, and finally mental trouble) is due to the absence from the diet of a part of the vitamin B_2 complex known as the P-P (pellagra-preventing) factor. This factor has now been identified as nicotinic acid (or amide), and dramatic and immediate cures of human pellagra and similar diseases in dogs, pigs, and monkeys have been obtained by the administration of minute doses of pure nicotinic acid.

Three sheep diseases of economic importance (" coast disease " of Southern Australia, " pine disease " of Great Britain, and " bush sickness " of New Zealand) have been shown to be associated with a deficiency of cobalt in the pasturage. Prevention or cure can be obtained by the administration of about 1 mg. cobalt per day.

General. The use of isotopes of several elements for " marking " compounds has provided a new technique in metabolic investigations. Work has already been carried out with compounds in which atoms of hydrogen, nitrogen, and phosphorus have been replaced by heavy hydrogen, heavy nitrogen, and radioactive phosphorus respectively. As these isotopes are readily identified, it may be possible to follow the course of metabolism of the " marked " compound.

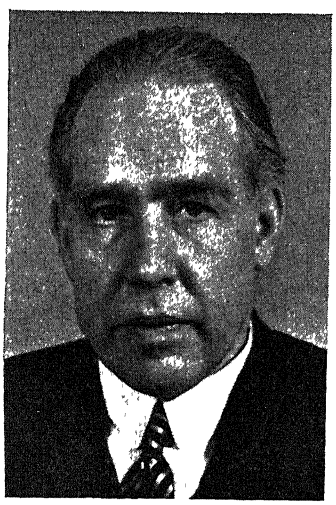
B. H., Leipzig) contains articles in English or German by experts on various aspects of enzyme biochemistry. (D. D. W.)

BIRD REFUGES : *see* WILD LIFE, CONSERVATION OF.

BIRMINGHAM, city and bishopric, Warwickshire, England ; pop. (est.) 1,048,000 ; approx. rat. val. £7,093,000 ; rates (1937–38) 15*s.*, (1938–39) 15*s.* 6*d.* ; debt £60,046,453 ; area 51,147 acres.

The second largest town in England and sixth in the British Empire, " The Metropolis of the Midlands " runs its own gas, electricity, and transport undertakings, its baths, museum, art gallery, and school of art, etc., also its municipal bank ; its manufactures are estimated to embrace 1,500 trades, and include small-arms, bedsteads, jewellery, machinery, tools, bakelite goods, and practically everything connected with railway-stock, cycles, motor-cycles and cars, and wireless sets, as well as chemicals, chocolate, etc.

The Hospital Centre which, during construction, was visited by the Duke of Kent in 1937, was completed in 1938, and was opened by the Duke and Duchess of Gloucester, on behalf of the King and Queen, in July. The opening coincided with the charter centenary celebrations of the Corporation, which included the staging of a great historical pageant, in which 8,000 performers took part and which the Duke and Duchess attended. During the year the foundation-stone was laid of the first building in the Civic Centre, and rapid progress is being made towards its completion. The Birmingham Airport scheme has shown considerable development, and the airport, which by then will have cost about £350,000, will be ready for use early in 1939 : the scheme will eventually cost over £500,000. Other municipal developments include the provision of a new market, with which is combined a large air-raid shelter, extensive additions to the electricity undertaking, and further housing developments which bring the total of houses erected by the municipality to 50,000.



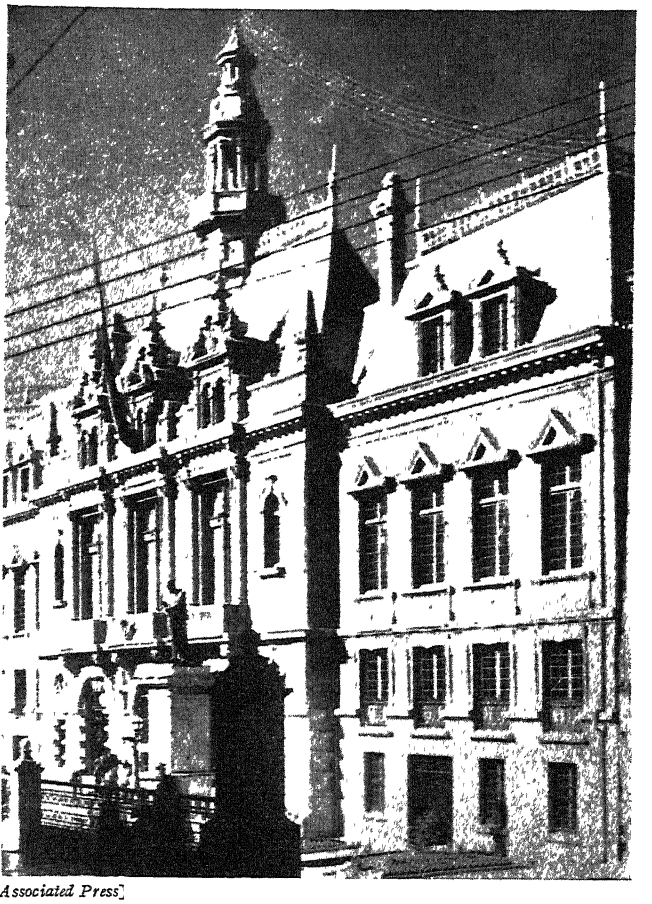
Industrial developments of very considerable magnitude have taken place, many of them connected with the air expansion programme ; the largest undertaking for the manufacture of aeroplanes is that of Lord Nuffield, to cost £3,000,000, and several " shadow " factories are now in production. Transport facilities, vital to the country's most inland city, have been improved by schemes of road

reconstruction and the provision of further canal warehousing facilities by the Grand Union undertaking, which in recent years has put in hand extensive improvement schemes upon its London–Birmingham route. During the year was celebrated the centenary of the opening of the London–Birmingham railway, which was the first provincial link with the capital.

While employment conditions in the autumn were less favourable than a year before, Birmingham remains among the most prosperous of the country's industrial centres: the increase in unemployment is partly due to the immigration of workpeople from depressed areas. (L. H. D.)

BIRTH STATISTICS: *see* VITAL STATISTICS.

BOHR, NIELS (1885–), Danish physicist, of whom a biographical account will be found in the *Ency. Brit.*, vol. 3, p. 788. After taking his doctor's degree at Copenhagen, he worked first at Cambridge, under Sir J. J. Thomson, and later in Sir Ernest Rutherford's laboratory, Manchester. In 1913, the year after his marriage, he became a lecturer at Copenhagen, and published his first papers on the quantum theory; in 1916, he was appointed professor of theoretical physics at Copenhagen, where he helped to found the institute of which he has been director since 1920. He achieved world-wide fame for his experiments in atomic structure, and his demonstration in 1921 of the applicability of the quantum theory to the physical and chemical properties of the elements led to the discovery of the element hafnium by Coster and von Hevesy. He was awarded the Nobel prize for physics in 1922, and four years later was elected a fellow of the Royal Society. In 1938, at the annual meeting of the British Association, he referred to the recent discovery of a new type of particle (which he proposed calling the "yukon" after its discoverer, Yukowa), which is believed to play a role in the phenomena of nuclear disintegration. In November he was awarded the Copley Medal by the Royal Society.



PROFESSOR NIELS BOHR

Based partly on J. W. Nicholson's discoveries in connexion with the atom, the work of Professor Bohr, who has been named "the Newton of Spectroscopy", can be regarded as the most important of all contributions to the modern theory of spectra and atomic structure.

BOLIVIA, a South American inland republic on the Southern Andean plateau; language, Spanish; capital, La Paz; president, Colonel German Busch. The area as adjusted by the Chaco arbitral award of 1938 is unofficially computed at 419,470 square miles. Population (official estimate, 1937), 3,226,295, with 50·9 per cent Indian, 26·8 per cent Indian and white admixture, 12·7 per cent white, 9·6 per cent "unspecified". Chief cities, with officially estimated populations (1936): La Paz, 202,000; Oruro, 44,826; Cochabama, 36,874; Potosí, 28,492; Sucre, 27,508.

There were several abortive revolutionary attempts during 1938. Termination of the Chaco controversy with Paraguay, settled by the treaty of July 21 and arbitral award of Oct. 10 (*see* CHACO), however, promised greater stability for the future. On Feb. 25 a treaty was signed with Brazil providing for establishment of railway communication between the two countries, and the exploration and exploitation of Bolivian petroleum to supply the Brazilian market.

Associated Press

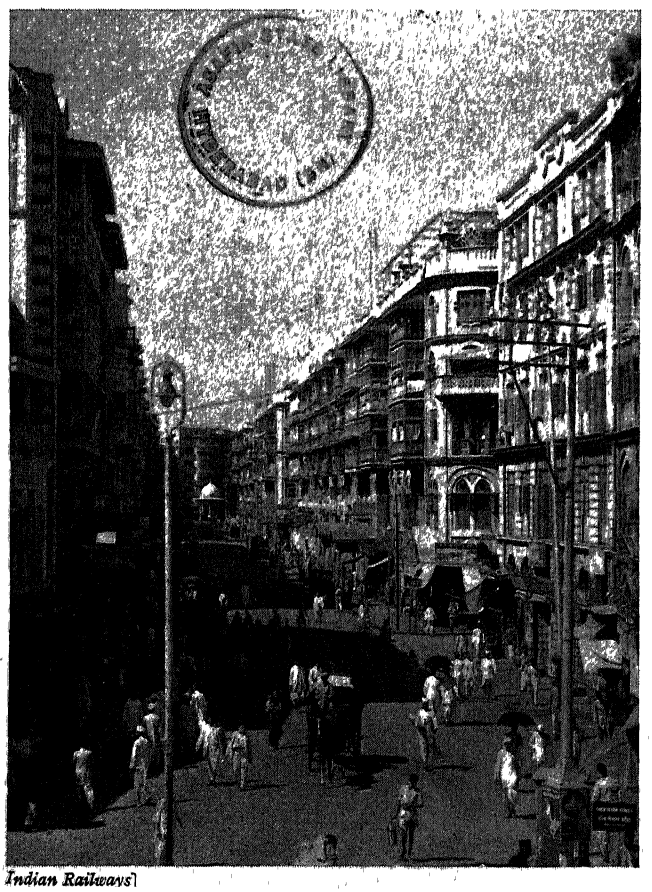
THE MUNICIPAL PALACE, LA PAZ, BOLIVIA

Inducements to immigrants included free land grants in eastern Bolivia and aid while getting settled, but since Government policy is one of slow infiltration of agricultural workers, it gave little encouragement to efforts to obtain a haven for refugee Jews.

Education. There are 1,600 primary and secondary schools, and three universities.

Finance. The monetary unit, the boliviano, is tied to the pound sterling at the ratio of 141·4 to 1, and trade statistics are reported in sterling.

Trade and Communication. Under the Chaco peace treaty of July 21, 1938, special rights of transit through Puerto Casado on the Paraguay river were obtained. Bolivia has 1,403 miles of railway, with 50 miles under construction, and 500 miles surveyed and projected. A further 454 miles, including a projected line to the Brazilian border, is under study. Main highways aggregate 1,900 miles in length, and secondary (open only in the dry season) 3,275 miles. A further 816 miles is under construction, but the highway system is generally inadequate, and air service is the only means of transport to parts of eastern Bolivia. Over 12,000 miles of navigable rivers provide a further undeveloped communication.



Exports are 97 per cent mineral (70 per cent tin), and totalled £9,011,724 sterling in 1937, 29·2 per cent more than in 1936, and £3,674,439 in the first half of 1938. Imports (manufactured goods and foodstuffs) were £4,009,818 in 1936 (United States, 30 per cent; Great Britain, 13·1 per cent; Germany, 11 per cent), and £1,964,997

in the first half of 1937 (United States, 25·6 per cent; Peru, 16·3 per cent). A 35 per cent increase was reported for the first half of 1938.

Agriculture and Minerals. Bolivia ranks third in world tin production, with 49,844 metric tons in 1937. Silver, gold, lead, wolfram, zinc, antimony, and copper are also produced in quantity. Bolivia has extensive petroleum resources, but produced only 91,000 barrels (est.) in 1938. Agriculture, with 4,940,000 acres under cultivation, falls short of domestic needs. (L. W. Be.)

BOMBAY, the "gate of India", lies on a group of islands connected by causeways and is one of the great industrial centres of the East. Its population is 1,161,383, including a small fraction of Parsees who play an important part in its financial and commercial life. The municipal corporation has just decided to democratize its constitution by introducing adult suffrage and having no nominated members—an attack upon the landlord interests, which were regarded as retarding development. The city's industries, in which cotton predominates, are recovering slowly from the recent depression; but a local scandal caused the stock exchange to close for six weeks early in 1938. (Me.)

BOMBAY PRESIDENCY. Politically the year 1938 has been one of great activity. Sir Roger Lumley continued Governor and Mr. B. G. Kher's Congress cabinet retained office. It had to face industrial difficulties on the one hand and rural problems in Gujerat and elsewhere on the other. A Trade Disputes Act, to regulate trade unions and prevent lightning strikes and lock-outs, provoked a strike of 40,000 Bombay mill-hands; they attacked the police, who had to fire. Another measure which evoked fierce opposition, though from another quarter, was a Tenancy law designed to give the peasantry greater security of tenure. A third measure of importance was the Forfeited Lands Restoration Act which restores to the former owners, on very modera compensation, lands forfeited and sold for non-payment rent during the civil disobedience campaign organized b Mr. Gandhi in 1930–31. The province was hard hit by slump in cotton, but while the manufacturers in Bomba were calling out for an export subsidy, a textile delegatic from Manchester was arguing at Simla for better treatmer in the Indian markets. This mission broke down; an when the central government's commerce minister, S M. Zafrullah Khan, came to England in September to di cuss matters with the Board of Trade, the result was equall unsatisfactory. (Me)

Indian Railways

STREET SCENE, BOMBAY

Area and Population:
Area 72,221 sq. miles.
Population (estimate 1937) 18,192,475.
Governor: Sir Lawrence Roger Lumley, G.C.I.E.
Languages. Gujerati, Marathi, Kanarese.
Religion. Mainly Hindu.
Production 1936:
Factories, 1,611; Average no. of workers employed 391,771.
Cotton industry, spindles 6,386,21
,, ,, looms 148,20
Finance:
Revenue (1937–38 estimate) . . Rs. 11,99,55,00
Expenditure ,, ,, . . Rs. 12,18,08,00
Education: recognized institutions (including Sind) 1936 Primary schools, 14,952; Secondary schools, 787 Scholars: 1,090,057 males, 340,408 females.
Motor vehicles licensed (March 31, 1937): cars and taxis 27,300; commercial vehicles, 1,750; motor-cycles, 1,550

BONNET, GEORGES (1889–), French politician born in Bassilac (Dordogne), son of an appeal judge, he studied law and became a Privy Council probationer in 1912; sergeant, later lieutenant, during the War (Croix de Guerre, Légion d'Honneur), he helped to form the League of Nations and represented France at the Barcelona and Geneva Conferences of 1922 and 1923. Elected deputy for Dordogne in 1924, under-secretary in the Painlevé cabinet in 1925, he lost his seat in 1928, but won a by-election the following year. Minister of finance and president of the French delegation to the London Economic Conference in 1933, he became minister of commerce in 1935, signed a commercial treaty with the U.S.A., was appointed ambassador to Washington in 1937, and returned a few months later to become minister of finance in the Chautemps cabinet. Since April 1938 he has been minister of foreign affairs. He was created G.C.M.G. during the Paris visit of the British Sovereigns in July, and in September accompanied the French prime minister to London in connexion with the German-Czech crisis. His action at that time in bringing pressure to bear on Prague in order to secure the acceptance of the Franco-British proposals resulted in several ministers indignantly tendering their resignations to M. Daladier as a protest. In November, partly owing to M. Bonnet's initiative, a French ambassador was appointed to Rome, and later in the same month he, with M. Daladier, received the British prime minister and secretary for foreign affairs on their official visit to Paris.

BOOKS: *see* Publishing.

BOOK SALES. No previous year has shown so clearly as 1938 that London is the centre of the world's trade in rare books. Both buyers and sellers from the Continent and the U.S.A. have been prominent in the London auction rooms. As usual, the majority of important book sales have been held by Messrs. Sotheby. The year began with the fourth part of the Clumber sale (Feb. 14–16), consisting mainly of manuscripts, including a large collection on

heraldry and genealogy. The total was £7,144. On Feb. 22 a fine copy of the Kilmarnock edition of Burns sold for £800. On March 23 began the dispersal of the finest collection of French books ever sold in England, the library of the late Mortimer Schiff, an American banker, which was significantly sent to England for sale. It was noteworthy for its fine decorative bindings. Record prices for bindings were probably the £900 paid for an eighteenth-century binding by Padeloup, covering a French edition of the *Imitation of Christ* (lot 253), and £1,110 for a copy of *Theophrastus* bound for Henri II and Diane de Poitiers. Among the many French editions of French classics was Molière's *Les Précieuses Ridicules*, which sold for £880. The first portion of the famous library at Ham House sold on May 31 for £11,117. It was rich in books from the presses of Caxton and Wynkyn de Worde, but the prices on the whole were disappointing. Lot 210, Le Fèvre's *History of Jason*, Caxton 1477, probably the first book printed in England, sold for £2,400. The second portion of this library was auctioned on June 21 for £16,250. It included a copy of the third folio edition of Shakespeare bound in contemporary red morocco, which possibly had belonged to Pepys. This realized £3,200. In the same sale was a large-paper copy of the first edition of Swift's *Gulliver's Travels*, which fetched the enormous price of £2,500. On July 5–7 the second part of the Schiff collection, containing similar material to the first, realized £15,700. A copy of the *Chansons de Laborde*, formerly the property of the Earl of Caernarvon, which is the most famous example of French eighteenth-century illustration, fetched £850. On July 26 the autograph manuscript of the eighth codicil to Napoleon's will, perhaps the last words the Emperor ever wrote, was brought for £820. Since the summer the only important book sale was that in December of the last portion of the Schiff library, which realized £12,840, and a book sale in December, where two remarkable bookbindings by the great Victorian craftsman Bedford sold for the high prices of £128 and £155.

During 1938 Messrs. Hodgson's regularly held book sales of less sensational interest. The two most important sales were medical books from Sion College held in April, including a first edition of Harvey's work describing the discovery of the circulation of the blood, Frankfurt 1628, which sold for £238; and books from the library of Thomas Hardy sold in May, where a presentation copy of Barrie's *Little Minister* brought £255. The total of each of these sales was £2,600. (J. I. D.)

United States. The principal dispersals in the United States were the Cortlandt Field Bishop and the William Randolph Hearst collections. The Bishop library was a remarkably catholic assemblage of incunabula, finely printed and superbly illustrated books, manuscripts, horæ, armorial and fine bindings, and English and French literature. Included was the Blickling homilies, properly described as "the earliest and greatest literary monument available, embodying the elements of the future greatness of English poetic prose", and dating from the tenth century, which brought $38,000 as against $55,000 in the sale of the marquis of Lothian's library in 1932. The Hearst collection, embracing many fields, was especially rich in choice Americana, particularly books connected with Washington and Lincoln.

The end of the year witnessed in New York the sale of a hitherto unreported copy of Poe's *Tamerlane and Other Poems*, issued anonymously (or rather as "by a Bostonian") in Boston in 1827. (The anonymity may be regarded as double, in that Poe himself was then a soldier in the United States Army under the name of Edgar Perry.) Twelve "Tamerlanes" are now on record, yet "Tamerlane" has so long served as the touchstone of rarity among the crown jewels of American literature that the world of bibliophily eagerly awaited the sale of the latest copy, which brought $4,300—a satisfactory price considering its condition.

BOOTLEGGING. The problem of the illicit liquor trade remains acute in the U.S.A. The latest figures (1938) give 11,407 stills seized with over 7,553,848 gals. mash and 344,668 gals. spirits confiscated, together with other property with appraised value of $2,599,999. Arrests for Federal liquor law violations were 25,867 (*Ann. Rep. Com. Int Rev. U.S.*), and the latest annual report of the Attorney-General for 1937 gave 26,784 individual defendants in cases filed, 20,162 of whom were defendants in liquor tax cases, and 21,550 convictions.

Coal. In 1936–37 bootleggers mined and sold illegally 2,400,000 tons of anthracite coal, about 5 per cent of total legal output, for which consumers paid $16 millions. Some 13,000 men were employed in the trade.

BORNEO. This large island in the East Indies is divided politically into Dutch Borneo, the (British) State of North Borneo, and the British protectorate of Brunei (*q.v.*) and Sarawak (*q.v.*).

The State of North Borneo is governed and administered, under British protection, by the British North Borneo Company: the State finances are under the exclusive control of the Company. Both natives and Chinese have benefited by the comparatively high prices of copra and rubber during 1937. In 1934 a concession was granted to the Anglo-Saxon Petroleum Company, Ltd., and operations are proceeding. There has been a marked revival in the seed pearl industry.

Area and Population:
Area *c.* 29,500 sq. miles.
Population (est. Dec. 31, 1937) 299,311 (*c.* 50,000 Chinese).
Governor and Commander-in-Chief. Mr. C. R. Smith.
Production 1937 (Export figures):
Rubber, 29,596,820 lb. ($8,786,711); Copra, $763,217; Tobacco, 407,081 lb.; Sago, 2,686,866 lb.; Edible birds' nests, $41,065; Cutch, $319,475; Timber. $2,842,189; Tinned, dried, and salt fish, $722,023.
Overseas Trade 1937:
Imports, net, $6,357,047; Exports, $14,766,536.
Communications:
Roads: 236 miles open to motor traffic.
Railways, 125 miles.

Wide World Photos]
A JUNGLE IN BRITISH NORTH BORNEO

Finance and Banking 1937:
Revenue, $3,556,144; Expenditure, $1,797,510.
Note circulation (Dec. 31, 1937), $1,824,586.
Currency, Straits $ = 2*s.* 4*d.*

Education 1937: Schools, 49; scholars, 4,736.

Details of the area and population of **Dutch Borneo** are:

Area and Population:
Area. Western District, 56,664 sq. miles; Southern and Eastern District, 151,621 sq. miles.
Population: total (census 1930) 2,194,533.

Government: under the Governor-General of the Netherlands Indies (*q.v.*).

BOSTON, seaport at the head of Massachusetts bay; capital of the State of Massachusetts, U S. Population (1935 State census) 817,713. The mayor Maurice J. Tobin (four-year term) and city council (two-year) took office in January.

Boston and the metropolitan area lost thousands of valuable trees in the New England hurricane of Sept. 21, 1938, but the greatest loss came from the paralysis of public services and transport facilities.

WPA projects (1938) included the Huntington avenue subway extension, a Huntington avenue underpass, the re-laying of sixteen miles of sewers and water mains, and the construction or reconstruction of forty miles of streets. The Massachusetts avenue underpass, the new Suffolk county court house and the South Boston housing project were opened. The U.S. Housing Authority allotted $29 millions for new projects.

Boston is the chief U.S. wool market and an important fishing port. Wool receipts (1937): 321,251,000 lb. Fish landed (1937): 321,226,753 lb., value $8,324,859; (Jan.–Oct. 1937): 306,660,264 lb., value $7,211,399, a 4·9 per cent increase by weight and a 4·8 per cent decrease by value. Total commerce of the Port of Boston: (1937) 18,390,390 tons (of 2,000 lb.), value $955,281,525; imports, 2,678,094 tons; exports, 473,073 tons; (Jan.–Oct. 1938): imports declined 55·4 per cent in value; exports declined 28.6 per cent. Passenger traffic to foreign ports (1937): arrivals 57,284, departures 16,395.

BOTANICAL GARDENS. At Kew, industrial developments causing serious pollution of the air affected some of the delicate plants and trees in the Royal Botanical Gardens. The arboretum at Tunbridge Wells is being prepared to receive plants which must have a cleaner atmosphere. The rock gardens were enlarged. Staff changes included the retirement of Mr. H. C. Sampson, economic botanist, who was succeeded by Sir Geoffrey Evans, lately of the Imperial College of Tropical Agriculture, Trinidad. Mr. J. Coutts, curator, retired and was succeeded by Mr. W. M. Campbell; Mr. J. H. Preston became assistant curator in the herbaceous and alpine department. Mr. C. A. Gardiner is working at Kew on a flora of Western Australia. The Dublin Botanic Gardens acquired the forestry herbarium of the late Professor A. H. Henry.

British Empire. In January 1938, the Royal Botanical Gardens at Calcutta celebrated its 150th anniversary. Delegates to the jubilee meeting of the Indian Science Congress visited it and the superintendent, Mr. Kalipada Biswas, received a D.Sc. degree for the thesis, *Studies on the systematic botany of India.* At Montreal, Canada, the development of the Jardin Botanique proceeded actively, and a large building is being constructed to house administrative offices, laboratories, a library, herbarium, and botanical museum. In the Straits Settlements, monkeys were trained to collect rare plants. Mr. J. W. Ewart was appointed as assistant curator of the Singapore Botanical Gardens, and Mr. A. J. M. Middlement as assistant curator of the National Botanic Gardens at Kirstenbosch, South Africa.

Netherlands Information Bureau]
BOTANICAL GARDENS, BUITENZORG, JAVA

United States. At the New York Botanical Gardens, Dr. William J. Robbins, University of Missouri, was appointed director and Dr. H. A. Gleason presented a report closing his term as acting director. Dr. John K. Small, director of research and curator, known for his work on the flora of the United States, died in January. Mr. N. Taylor, of the Brooklyn Botanic Garden, was appointed director of the Cinchona Products Institute, New York. The Brooklyn Botanic Garden exchanged plants and seeds with about 160 other gardens and supplied specimens to educational institutions. At Huntingdon, Indiana, a botanical garden of 3½ acres, containing over 300 species of plants and an arboretum, both devoted to the study of the wild native plants of northern Indiana, were dedicated in June.

Europe. In Holland, Leyden University celebrated the 350th anniversary of the founding of its botanical garden. Of the seven oldest gardens, only those at Leyden and at Padua, founded 1545, are still maintained on their original sites. The other old gardens are the Vatican (1447), Leipzig (1542), Pisa (1543), Florence (1546), and Bologna (1567). The Brussels Botanic Garden acquired collections of plants from the Congo. In Poland, Dr. R. Kobendza is in charge of the planting, now in progress, of the new botanical garden of Warsaw University. The garden, which covers 42 hectares, is situated in the Pilsudski Memorial Park. Dr. L. Faucheron was appointed honorary director of the Jardin Botanique de la Ville, Lyons, France,

in place of M. Robert Douin. The director of the new botanical gardens at Moscow, Mr. M. S. Navaskin, has retired. Victor Buchholz, gardens inspector of the Hamburg Botanic Gardens, died. Linnæus' house in the old botanic gardens at Uppsala has been restored as nearly as possible to its state when Linnæus lived there.

Asia. The physiologist appointed to the Treub laboratory botanic garden, Buitenzorg, Java, is Mr. T. H. van der Honest, of Pasoeroean. Mr. J. J. Smith, formerly of the Buitenzorg gardens, has retired, and is now an honorary collaborator at the State herbarium of Leyden. The Buitenzorg gardens are being reorganized in order to revise the Institute programme of work. The mulberry plantation of the Sun Yat Sen University, China, was seriously damaged by bombs.

South America. A new national botanical garden was founded in Cali, Colombia, with funds raised by a large horticultural show held in 1937. (V. R.)

BOTANY. Botanical literature was enriched in 1938 by several historical works. *Sixty Years of Botany in England* by Prof. F. O. Bower gives vivid sketches of his many outstanding contemporaries and an "eye-witness account" of a period in which the foundations of plant morphology were firmly laid and in which modern botany emerged as an experimental science. Fresh light on Linnæus and the species concept is shed by the published address of Dr. J. Ramsbottom delivered on the 150th anniversary of the Linnean Society. Prof. W. Stiles summarizes the development and present status of knowledge of the general physiology of plant cells. The latter deals with more controversial issues. Though he speaks with some authority in this field many will not always agree with Stiles's interpretations, especially of the evident trend of recent years toward the recognition that plant cells invoke vital processes to accumulate their salts.

Morphology. Sir Arthur W. Hill[1] has made a notable contribution by an account of the seedlings of certain apparently monocotyledonous genera of dicotyledons. In these (Cyclamen, Corydalis, Pinguicula, Peperomia) the single cotyledon has been regarded as two fused cotyledons. This view is now disproved. The seedling "monocotyledonous" Peperomias really have a second cotyledon which never leaves the testa and is only an absorbing organ. Very striking is the case of various genera of the Gesneriaceæ in which one of the two cotyledons continues to grow at its base while the other aborts at an early stage. In some species the enlarged cotyledon is the only leaf on the plant and it is shown that it consists of the enlarged, hairy base of the petiole with the glabrous cotyledon still recognizable at its tip.

An examination (by Kausik[2]) of the floral morphology of *Grevillea robusta*, one out of 160 species in a genus of the large family Proteaceæ, describes a unique development of the endosperm. This consists of a coenocytic "vermiform" appendage and it attains a length of 3mm. as it coils and ramifies throughout the chalaza and on its way digests the nucellar tissue. This surprising structure constitutes an absorbing organ for the nutrition of the developing embryo sac.

Fossil Plants. Barghoorn and Bailey[3] have examined specimens from the auriferous gravels (miocene) of California. In this formation logs have been preserved for millions of years although they are not mineralized or carbonized and the cell walls still contain cellulose and lignin. The anatomy of the wood has been described and illustrated by elegant figures and it is concluded on anatomical grounds that the material is Cedar, not Sequoia as believed hitherto, although it differs from all living species of Cedrus in the absence of ray tracheids.

Anatomy. Tippo[4] has contributed a comprehensive study of the comparative anatomy of the Moraceæ and their presumed allies which is based on an examination of 465 species from 165 genera and 22 families. The comparisons are based on histological features, *e.g.* the type of vessel ending, vessel diameter, type of thickening and pitting, and the general facts of wood and ray structure. The many contributions to histology and wood anatomy and excellent figures will be appreciated even by those who have no enthusiasm for the phyllogenetic approach to anatomy.

Modern views on the structure of the plant cell wall combine the results of microscopical observation and of the physical methods (X-ray diffraction and the use of the polarizing microscope) used in crystallography. Clarke[5] gives a popular account of the results in this field which, though admittedly for the general reader, should hardly ignore the recent work of Preston[6] on the gymnosperm tracheid and of Preston and Astbury[7] on the wall of *Valonia*.

Ecology. In 1930 and 1933 *Zostera marina*, a valuable marine flowering plant which supplies food to birds, shelter to fish, acts as a binder for sand and mud and produces foliage used as an insulating material, almost disappeared from the North American coast. A similar epidemic disease affected British coasts in 1931–32. After an examination of the autecology of the plant Tutin[8] concludes that the causes of the disease are neither pathogens nor pollution but are to be sought in climatic conditions.

Cytology. The spiral structure of chromosomes still arouses controversy. Darlington,[2] who has criticized Gate's assertion that the metaphase chromosomes of *Trillium* contain four strands coiled about each other in pairs because the fixation used acetic fluids, also describes the differential reactivity of definite portions of the chromosomes of *Paris polyphylla* to nitric acid vapour. When these chromosomes react definite portions become more tightly coiled than the rest. Abrupt changes in the spiral direction of chromonemata, which in Trillium may reach 45 per cell, are to be correlated with the frequency of chiasmata at meiosis.

Physiology of Development and Reproduction. Gregory and Purvis[2] have proved that the effect of controlled low (+1° C.) temperatures which will convert a "winter" rye to a "spring rye"—the effect known as vernalization—is upon the embryo itself. Excised embryos can be vernalized in presence of sugar and a minimal oxygen concentration. The effect is specifically due to temperature. Work on photoperiodism (Borthwick and Parker[4]) shows that in Biloxi soya beans the stimulus is "perceived" in the leaves and it is claimed that responses can be discerned in the growing point to as few as two short photo periods. In the cocklebur the effect due to short day stimulus can traverse a diffusion contact between severed portions of the plant (Hamner and Bonner), and a new specific "flower initiating substance" is anticipated. Meanwhile, Gustafson[3,4], by applications of hetero-auxin (indole-acetic acid), has produced parthenocarpic development of certain fruits (*e.g.* tomato).

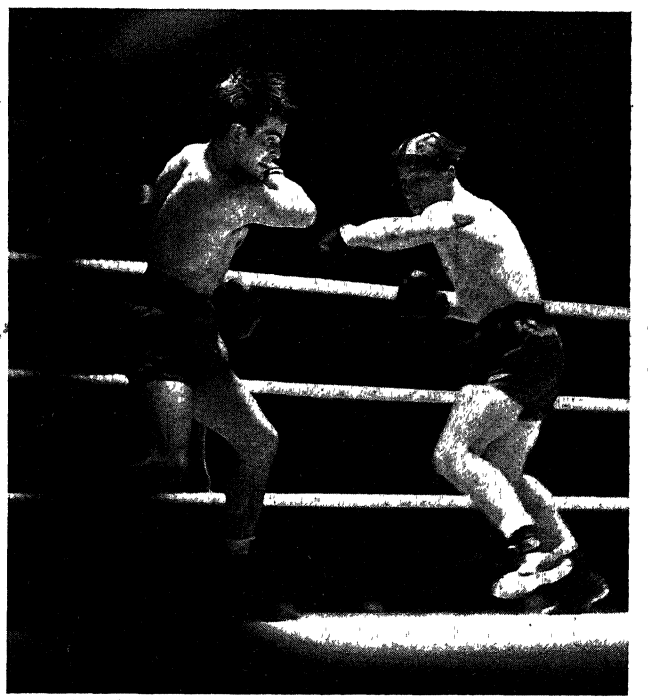
A large number of publications deal with the substances now termed "auxins". Two papers by Thimann[3] and Went[2,3] may be consulted. The auxines constitute a special group of plant hormones by which it is supposed that the shoot apex exerts its effect on the enlargement of older cells below, suppresses the growth of lateral buds, promotes the regeneration of roots on shoots, controls the differential

swelling of isolated strips of stem (in Pisum, etc.) and, except in almost unbelievably low concentrations (1 gm. in 10^6 litres!), depresses the growth of roots. The molecular configurations compatible with auxine activity are now well known, *e.g.* indole-acetic acid is very active, whereas dihydro indole-acetic acid is inactive. Auxin does not act independently but the tissue also requires sugar for its response, and oxidation is believed to be an integral part of the mechanism. The spate of growth substances continues. A wound hormone, traumatin—which induces intumescences in the tissue of legumes, has been postulated and active preparations made. Went now postulates that effects of auxin, other than on cell elongation, are secondary and due to the role of auxin in activating other specific growth substances, termed calines. Hypothetical calines regulate stem elongation (" caulo-caline " from roots), root growth (" rhizo-caline " from cotyledons), and growth of leaves (" phyllo-caline "). The sceptic notes that these are as yet mere words—but in this field the sceptics of to-day may be confounded by the accepted facts of to-morrow. Went interprets on his caline hypothesis the results of transplanting etiolated shoot apices of pea on to other " stocks ". The results are reminiscent of the interacting effects of scion and stock in fruit trees which are now well known but unexplained.

Nutrition. The investigation of the special organic nutrients which stimulate growth and development in minute amounts and which explain the beneficial effects of applications of yeast extracts in plant cultures has received a great stimulus by the availability of crystalline vitamin B1 and the substances used in its synthesis. Numerous works deal with the role of these substances in the nutrition of fungi and of roots cultured aseptically. The importance of these and other organic stimulants is established, though their role is unexplained.

The popular imagination, especially in the United States, has been seized by so-called " Soil-less growths of plants ". Sand and water cultures have long been familiar as research methods. Modern work on the nutrients only required in great dilution (so-called " micro-elements " or " micro-nutrients ") has familiarized many with larger scale cultures than hitherto The methods of water culture adopted for the cruder technique of general practice now appear in the guise of a new system of horticulture to which the name " Aquiculture " or " Hydroponics " is given (Gericke[5]). Though impressive results have been obtained extravagant claims are to be deprecated. It is significant that from the very home * of " hydroponics " a manual informs the general public that " growth of plants without soil " is not to be lightly undertaken, whether for pleasure or profit, without adequate knowledge of plant nutrition.

Space prohibits reference to the many advances made in the investigation of plant metabolism.



Details of the work referred to above appeared in 1938 in the following journals: [1] *British Assn. Reports*; [2] *Ann. Bot., N.S.*; [3] *Amer. J. Bot.*; [4] *Bot. Gaz.*; [5] *Nature*; [6] *Phil. Trans. Roy. Soc.*; [7] *Proc. Royal Soc.*; [8] *New Phytol*; and [9] *Plant Phys.* * *Univ. of Cal. Agr. Exp. Sta.* (Circular No. 34). (F. C. S.)

BOURNE, ROBERT CROFT, British oarsman and politician, was born on July 15, 1888, and died on Aug. 7, 1938. He was educated at Eton and New College, Oxford. A very great stroke oar, his many fine rowing achievements were overshadowed by his unique record of stroking the Oxford crew to victory against Cambridge in four consecutive years, from 1909 to 1912. He served in the World War in the Herefordshire Regiment, being wounded at Suvla Bay, and was promoted Captain in 1917, in which year he also served on the Claims Commission. Bourne had been called to the Bar in 1913, and after the war he devoted himself to local and national politics. He was elected Conservative M.P. for Oxford City at a by-election in 1923, and since 1931 had been Deputy Chairman of Committees. He was sworn a member of the Privy Council in 1935.

BOWLS. Better weather during most of 1938 and the rise to popularity of the indoor game are the principal reasons for the increase of interest taken in bowls in Great Britain, as evidenced by the increase in entrants for the principal events. In the preliminary rounds—the county championships—of the national championships of the English Bowling Association there were 4,957 entries, in the pairs, 4,584 and in the rinks 2,143, considerable increases in each case. The singles was won by K. C. Cross, of Cosham B.C., Hants; the pairs by the two A W. Knowlings (father and son), of Worthing B.C., for the second time in succession; and the rinks by Paddington B.C. In the inter-county championship for the Middleton Cup Dorset beat Durham, neither having before figured in the finals; and in the internationals the *News of the World* Cup again went to Wales—Ireland, Scotland, and England following in that order. Wales has now won eight times, England seven times, Scotland sixteen times, and Ireland once.

There have been a few slight alterations in the laws during the year, but, in the opinion of many players, they are still far from perfect and in some particulars are in need of clarification.

BOXING. In Great Britain the year 1938 cannot be looked upon as a " boom " year, but when reviewed it will be found that the number of important contests was up to the average, even although a number of Press articles declared the sport to be " dead " and set-backs were experienced from leading boxers failing to make their contracted weight. The greatest shock of the boxing world in this respect was on June 29 when Benny Lynch scaled 6½ lb. over the flyweight limit, thus forfeiting the only

Sport & General]
ERIC BOON (RIGHT) DEFEATING DAVE CROWLEY, DEC. 15, 1938

world's title to be held in Britain. Peter Kane, the Lancashire lad, however, defeated Jurich, the American champion, and thus brought back the title once again. In June also, Johnny King retained his British title against Len Hampston. In August, Johnny McGrory failed to pass the scale, thus forfeiting the British featherweight title. This title, however, was contested and won by Spider Kelly against Benny Caplan in November—Kelly being the first Northern Ireland boxer to win this title and the Lonsdale belt. Activity in the lightweight division brought about two title contests. In June Dave Crowley won the title from Jimmy Walsh, and in December Eric Boon, 18 years of age, created the year's sensation by defeating Dave Crowley. The welterweight division showed the rise of Ernie Roderick, but he was prevented from boxing for the title owing to the repeated illnesses and accidents to the champion, Jake Kilrain. Jock McAvoy started the year holding two titles. He still retains the middleweight title, but lost the light-heavyweight title to Len Harvey in April. Len Harvey again came to the front by defeating Eddie Phillips in December for the heavyweight title, thus, in the same year, becoming the holder of two titles.

The year did not see any outstanding boxer rise from the continent. In April a World's Boxing Conference was held in Rome and plans were again laid down for a working agreement between the continental control body and the British Boxing Board of Control (1929). The newly formed National Sporting Club, Ltd., continued their weekly programmes with further successes, adding greatly to the interest in the sport. The number of professional boxers in Britain increased by 429, making a total of 2,767 actively engaged in the sport, which, together with all other sections, makes an approximate total of 5,000 obtaining their livelihood from boxing. (C. F. Do.)

United States. Negro boxers dominated the ring more in 1938 than any other year in modern times. This, and the return of the million-dollar gate, were the outstanding developments of 1938 in the United States.

Joe Louis reigned as world heavyweight champion and defended his title three times. John Henry Lewis prevailed as leader of the light-heavyweight ranks and retained his title against the few challengers available. Henry Armstrong, who late in 1937 won the world featherweight championship, hammered his way to the world welterweight title and followed this by winning the world lightweight championship, becoming the first boxer in all ring history ever to hold three titles at one time. He found it impossible to make nine stone to defend his featherweight crown, and surrendered his claim to this championship. He finished the year holding the lightweight and welterweight championships, after having defended the welterweight championship twice.

Louis defended his heavyweight title no less than three times within the space of six months. He knocked out Nathan Mann of New Haven in 1 min., 56 sec. of the third round in Madison Square Garden in February. He followed this with a knockout of Harry Thomas of Eagle Bend, Minn., in 2 min., 50 sec. of the fifth round in a bout in Chicago in April; and knocked out Max Schmeling in 2 min., 4 sec. of the first round in their bout held in the Yankee Stadium in June. This last fight drew actual gate receipts of $1,015,096, a figure which included $75,000 realized on the sale of motion-picture and radio rights to the battle. Louis received $349,288 for his brief night's work, and Schmeling collected $174,644.

Armstrong won the world welterweight championship on May 31, when he pounded his way to a decision over Barney Ross of Chicago. On August 17, Armstrong defeated Lou Ambers of Herkimer, N.Y., to gain the lightweight title. Both bouts were held in New York city. Armstrong retained the welterweight championship against Ceferino Garcia, Filipino challenger who was regarded as the most dangerous contender for the 10 st. 7 lb. title, and ten days after this bout, again defended the welterweight title, his last victim being Al Manfredo, in a bout held in Cleveland.

John Henry Lewis made one defence of his light-heavyweight championship. He held the title against Al Gainer, only to have the New York commission withdraw its championship recognition when he failed to take up a challenge issued by Tiger Jack Fox of Seattle. The year ended with this title in dispute. Freddie Steele lost his world middleweight championship to Al Hostak, and the latter in turn lost the championship in his first defence of it when Solly Krieger, of Brooklyn, gained a decision over him. Krieger, however, ignored a challenge from Fred Apostoli of California, and the middleweight championship likewise went into dispute. When Armstrong surrendered his featherweight championship, the title was immediately placed in competition in a tournament sponsored by the New York State Athletic Commission. This was won by Joey Archibald of Providence, R.I., but his claims were ignored by the National Boxing Association which, through its separate membership bodies, controls boxing in forty-seven States. The N.B.A. recognized Al Rodak of Chicago. Sixto Escobar regained the bantamweight championship when he won a decision over Harry Jeffra of Baltimore in February. Greatest confusion, however, involved the flyweight division, in which the British Boxing Board of Control recognized Peter Kane of England, and the California State Athletic Commission, Little Dado, a Filipino; New York State Athletic Commission recognized no holder of the title at all.

BOYS' CLUBS: *see* COMMUNITY CENTRES AND CLUBS.

BOY SCOUTS. The Boy Scout movement continued during the year to develop and increase its scope in most countries, though in Austria and Czechoslovakia its activities were curtailed by the institution of the Nazi regime. The membership throughout the world at the end of 1938 amounted to 2,829,545, according to the latest figures available.

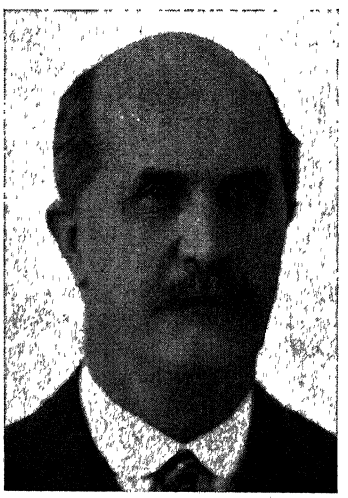
In the parent movement in Great Britain, an appeal for a permanent development fund brought in over £250,000, which included a gift of £50,000 from Lord Nuffield.

During the summer the Chief Scout of the World inspected Scouts in Iceland, Norway, Denmark, and Belgium, during a "cruise of friendship" to these countries on board the S.S. "Orduna". Representatives from 21 different countries attended the First International Conference of Leaders of the Wolf Cub (junior) branch of the movement, which was held at Gilwell Park in July. At Windsor Castle in April the King inspected a St. George's Day Parade of "King's Scouts" from all parts of Great Britain.

Scout contingents from many parts of the world visited Australia to take part in a Jamboree at Sydney, organized by the Scouts of New South Wales.

A large amount of international camping was carried out by Scouts visiting foreign countries for the purpose of their annual camp. National camps on a large scale, attended by contingents from other countries, were held in France, Iceland, Latvia, Lithuania, Luxemburg, Sweden, and

Switzerland. In this way, and through the interchange of correspondence, the movement continued to pursue its policy of international friendship and goodwill.



Scouting throughout the world suffered a great loss through the death of Mr. H. S. Martin, C.V.O., who had been International Commissioner of the British movement since its very early days, and Director of the International Bureau since its formation in 1920. The year 1938 saw the completion of the thirtieth year of the Scout movement, founded in 1908 by Lord Baden-Powell. (E. K. W.)

United States. During 1938 the increase in membership of the Boy Scouts of America was 142,059, bringing the grand total membership up to 1,271,900 (Dec. 31, 1938). About 500,000 boys went to camp at some time during the year.

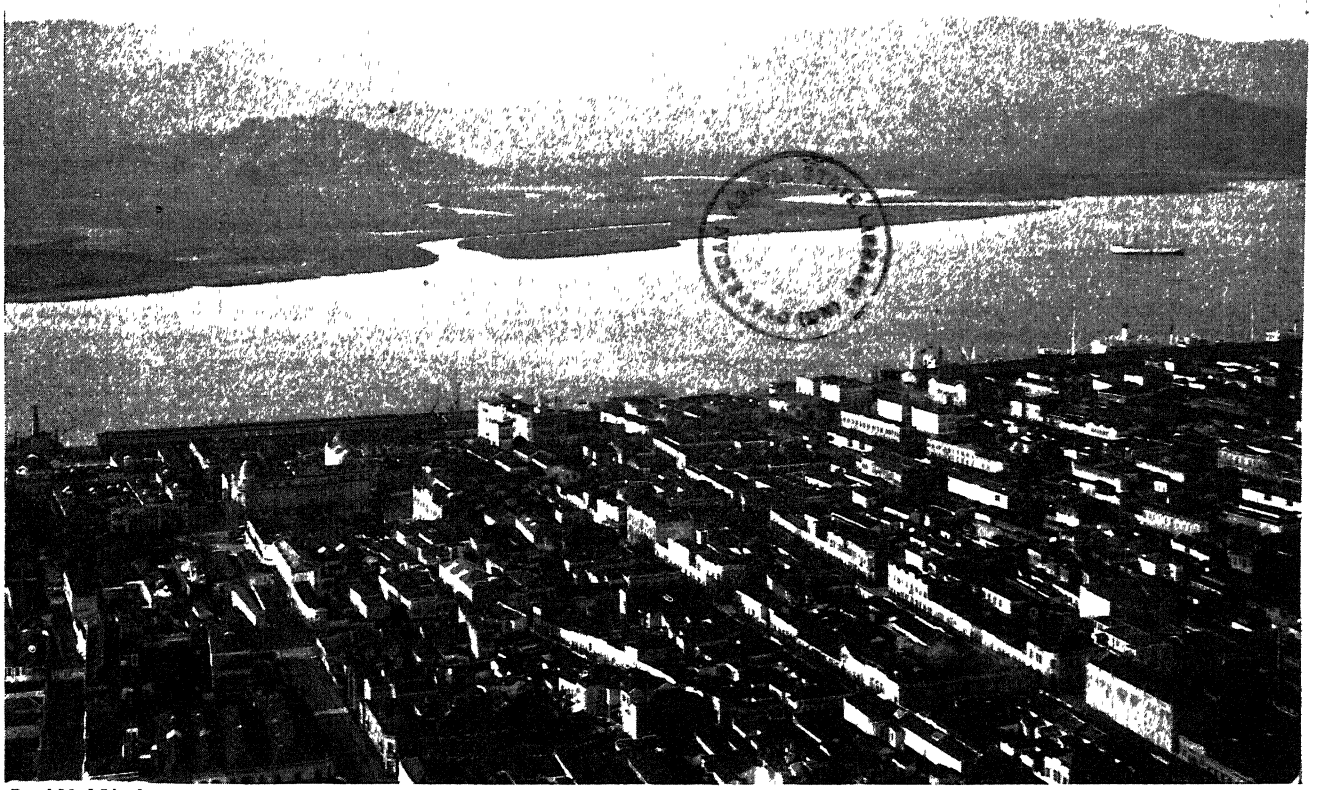
Camping received a great impetus from a magnificent bequest by Mr. and Mrs. Waite Phillips of a reservation in the Rocky Mountain Continental Divide, consisting of 35,857 acres of superb mountain wilderness. More boys than ever went to camp as members of patrols and troops. A new handbook on Rural Scouting was developed which, it is expected, will greatly stimulate Scouting in rural areas. The 28th meeting of the National Council was held in Cleveland, Ohio, and the delegates pledged themselves again to extend Scouting to all boys.

The Schiff Scout Reservation at Mendham, N.J., was widely used for training courses and has a laboratory for troop camping.

BRAGG, SIR WILLIAM, K.B.E., O.M., P.R.S. (1862–), British physicist, a record of whose achievements—especially as a pioneer research-worker in the fields of radioactivity and crystallography—will be found in the *Ency. Brit.*, vol. 3, p. 1011, after holding various professorships became, in 1915, Quain professor of Physics at London, and in the same year, with his son William Lawrence Bragg (*b.* 1890), was awarded the Nobel Prize for Physics and the Barnard Gold Medal of Columbia University. Among the many honours that have been bestowed on him since (beside the K.B.E. in 1920 and the O.M. in 1931) are the Rumford Medal of the Royal Society, the Società Italiana della Scienza's Gold Medal, the Franklin Gold Medal (Philadelphia), the Faraday Medal of the Institution of Electrical Engineers, the medal of the Institute of Metals, and honorary doctorates of the universities of Manchester; Brown (Rhode Island, U.S.A.); Leeds; Trinity College, Dublin; Durham; Pennsylvania; St. Andrews; Oxford; Bristol; Glasgow; Sheffield; Cambridge; and Wales.

P.P. Bureau]
SIR WILLIAM BRAGG

Sir William was president of the British Association, 1928-29, has been Fullerian Professor of Chemistry at the Royal Institution and director of the Davy-Faraday Research Laboratory since 1923, and since 1936 president of the Royal Society. In June 1938, he opened the Meyerstein Institute of Radio-Therapy at the Middlesex Hospital, London. His wife (*d.* 1929) was a daughter of Sir Charles Todd, F.R.S. (*d.* 1910), the English-Australian astronomer and postal administrator. Among his many publications are works on radioactivity and crystallography: *Concerning the Nature of Things* (1925) and *The Universe of Light* (1933).



BRAUCHITSCH, WALTHER VON (1881–), German general, was born in Berlin on Oct. 4, 1881, the son of a general of cavalry; he was educated in Berlin, entered a military academy, and became a lieutenant in 1900. Since 1912 and during the World War, Brauchitsch has been a General Staff officer, and his decorations include the Iron Cross (first and second grades) and the House Order of the Hohenzollerns. He was appointed Inspector of Artillery in 1932, and in 1933 replaced Marshal von Blomberg as Commander of the East Prussian Army District, which in 1935 was transformed into the 1st Army Corps. In 1937 he became Commander of the 4th Army Group, and in Feb. 1938 succeeded General von Fritsch as Commander-in-Chief of the German Army, being promoted at the same time Colonel-General. Apart from his military work he is a keen student of economics and foreign policy. He married Elizabeth von Karstedt in 1910 and has two sons and a daughter.

BRAZIL, a republic in eastern South America; language, Portuguese; president, Getulio Vargas. Area, 3,291,416 sq. miles; population (30,635,605 by the census of 1920), officially estimated in 1937 as 43,246,931. Chief cities: Rio de Janeiro, the capital, 1,801,784; São Paulo, 1,217,330; Recife (Pernambuco), 510,102; São Salvador (Bahia), 375,756; Porto Alegre, 352,068; Belém (Pará), 303,740; Bello Horizonte, 193,706.

The Vargas programme, with nationalism and nationalization as its keynotes, resulted in complicated domestic and foreign situations in 1938. Led by Plinio Salgado, the frustrated Integralists continued to operate, and the climax came in Rio de Janeiro at one o'clock in the morning of May 11, when the "Green Shirts" staged a well-planned but poorly executed revolt. Within a few hours the entire movement, which had affected the capital alone, was quashed, with 12 persons dead and 22 wounded. Salgado fled the country. Over a thousand arrests were made and several hundreds were sentenced to gaol, but there were no executions. President Vargas placed the blame for the rebellion on "exotic doctrines". Several employees of a German banking institution in Rio de Janeiro were among those arrested.

Development of the important inland state of Minas Geraes was aided when, in March, it was granted use of the port of Angra dos Reis in order to avoid payment of heavy duties and transhipment tolls through the port of Rio de Janeiro. A direct railway to connect Minas Geraes with Angra dos Reis is contemplated. A further step towards elimination of trade barriers was taken with a decree for gradual reduction of interstate export taxes, with complete abolition by 1943. Vargas decreed the nationalization of Brazil's petroleum industry in April.

The rapid increase of refugees illegally in the country, largely from Germany and Austria, focused attention on the need for new immigration regulations. Equally influential was the susceptibility of Brazil's large and isolated colonies to outside propaganda. A new immigration law (May 4), replacing that of 1934, permitted the annual entry of two per cent of the total of any nationality coming into the country over the fifty-year period 1884–1933, with the requirement, however, that at least eighty per cent of the allotment be agricultural workers. In February, Nazi and

Royal Mail Lines]

SANTOS, BRAZIL

Fascist organizations were closed in Rio Grande do Sul state, which, along with Santa Catharina, has the largest percentage of German and Italian blood in Brazil. By April privately owned foreign schools in both states had been taken over. In that month Vargas promulgated a decree against foreign propaganda in the country. In non-Brazilian communities instruction in Portuguese was made compulsory, teaching of a foreign language to children under fourteen forbidden, and instructors required to be of Brazilian birth. Settlements composed entirely of one nationality are also now forbidden.

Mutual recriminations between Brazil and Germany were violent after the May 11 revolt, and on Oct. 15 Brazil informed Germany that its ambassador, Dr. Karl Ritter, was no longer *persona grata*. Germany countered by requesting the withdrawal of the Brazilian ambassador. Good will between the two countries was likewise affected by their economic relations. Germany insisted upon the barter system of exchange, whereby Brazil was forced to accept "aski marks", good only for the purchase of German goods. Germany was accused of re-selling the Brazilian products thus acquired in competition with Brazil herself.

A pact with Venezuela (Dec. 10) called for pacific settlement of any controversies which might develop. Brazil's ties with the U.S.A. were strengthened in March, when Dr. Oswaldo Aranha, popular ambassador to the United States and long a confidant of President Vargas, was recalled to assume the post of foreign minister.

At the Eighth Pan-American Conference (*q.v.*), the Brazilian delegation, headed by the former Foreign Minister Afranio Mello Franco, desired the exclusion of all "isms" from the Western Hemisphere, and sought unified action of the Americas in the face of possible political encroachments from without, but was unwilling to go to the point of supporting any move for formal military alliance or an American League of Nations.

Education. In 1935 there were 36,661 schools with a total enrolment of 2,862,666. Except in a few cities there is no compulsory education.

Defence. Plans have been made to enlarge and modernize the nation's defences. The army is estimated at 93,892 with a reserve of 206,959. Military service is compulsory. In 1938 three submarines were delivered from Italy; six destroyers were under construction in Great Britain; three more, in addition to minor craft, were being built in Brazilian shipyards. Domestic manufacture of planes paralleled heavy importations of aircraft and munitions.

Finance. The monetary unit is the milreis (value: approximately 3d.), ordinarily expressed in contos of 1,000 milreis each for large transactions. The budget for 1939 as approved by President Vargas estimated receipts at 4,070,969 contos and expenditures at 4,065,599. Payment has been suspended on the Brazilian debt.

Trade and Communications. In October, a fast steamer service was inaugurated from New York to Rio de Janeiro (and thence to Montevideo and Buenos Aires) by the newly organized American Republics Line, operated by the United States Maritime Commission. On February 25, a treaty was concluded under whose terms a Bolivian-Brazilian railway would be constructed to link Bolivia with another projected line between Porto Esperança and Corumbá. (*See* BOLIVIA.)

In 1936 there were only 21,313 miles of railway, chiefly along the coastal plain, but internal communication is

being improved. Electrification has been prominent in railway development. Air service has expanded rapidly, with important lines running into the otherwise isolated Amazonian interior. Brazil has about 17,000 miles of good motor roads. Communications were allotted the second highest percentage of appropriations in the 1939 budget.

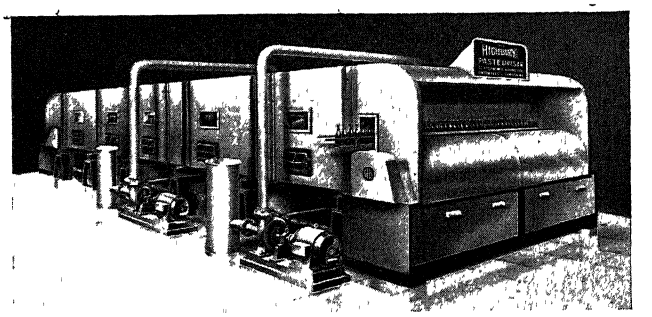
In 1937 imports totalled £40,608,000, an increase of more than a third over 1936. In the first nine months of 1938, however, their value declined £2,092,908 compared with the same period in 1937. Oversupply led Brazil to refuse to accept "aski" marks in June, but German suspension of Brazilian purchases and a reduction of the excess supply of marks resulted in trade resumption in November. For the first nine months of 1937, Germany contributed 24·08 per cent of Brazil's imports, the United States, 21·65, Argentina, 15·47, and Great Britain, 12·12. Foodstuffs (especially wheat), manufactured goods, and raw materials constitute the main imports

Exports in 1937 totalled £42,530,000, an increase of 8 per cent over 1936. The United States took 35·71 per cent of exports, followed by Germany (16·16), and Great Britain (9·48). Coffee represented 42·41 of all exports, and cotton slightly over 20. Although bumper crops of both were reported in 1938, their market value decreased, and export values fell accordingly. Owing to the rise of imports in relation to exports, government control of exchange was continued in the first half of 1938, with hampered foreign trade resulting.

Production. Brazil is primarily an agricultural country, although there has been a steady increase in industrialization since 1926. Three-fourths of the world's coffee supply is produced, but other crops have risen in relative importance, pushing coffee, which comprised almost 75 per cent of Brazilian exports in 1933, to less than half in 1937. Cotton has undergone a phenomenal development since 1932, jumping from nineteenth to second place among the country's exports; the 1937–38 crop was estimated at the record figure of 1,568,000 bales. Brazil is second only to the Gold Coast of Africa in world production of cacao. It is estimated that within two years increased production of wheat will meet the entire national demand. The livestock industry, principally cattle, accounts for almost ten per cent of the exports.

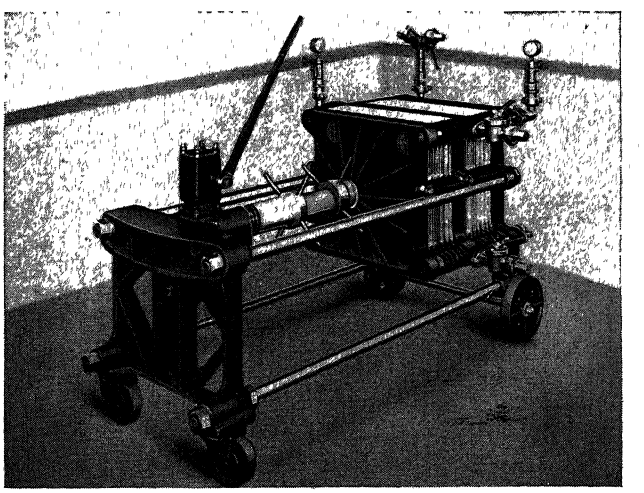
Brazil is estimated to possess as much as forty per cent of the world's supply of iron, but lack of capital, coal, and adequate transport have hindered its development. There is no petroleum, but under the Feb. 25, 1938, treaty with Bolivia joint exploitation of that country's oil deposits in the eastern Andean foothills was provided, with special facilities for supplying the Brazilian market.

Manufacturing, a third of it located in the state of São Paulo, is increasing. Resources of a forest area in excess of 1,500,000 sq. miles are as yet only slightly developed, but already supply important commodities, including the castanha (Brazil nut). (L. W. Be; X.)



BREAD AND BAKERY PRODUCTS. There have been no basic alterations recently in the standard methods of breadmaking. There has, however, been a tendency for the number of large, completely automatic plants to increase. Present conditions of labour make it necessary to simplify the process whenever possible, and in this connexion there is an inclination to-day to discard the older sponge method and to adopt the straight-through process, in which no preliminary sponge is made, the yeast being mixed direct with the weight of flour necessary for the complete batch.

In view of this, it is not surprising that the use of yeast foods has increased, the object of these products, which consist of a mixture of salts, malt, etc., being to provide food for the yeast and so to bring about a quicker fermentation. It is doubtful whether so good a flavour to the bread is obtained as from the older methods, entailing longer fermentation.



The manufacture of biscuits continues to develop in all parts of the world. For the most part the biscuits produced are of the cheaper varieties, and are made on automatic plants involving minimum labour costs. In these plants the baking is done in ovens up to 200 ft. in length, and this necessitates feeding by fast cutting machines. Under these conditions a very large output is obtained. The biscuits are baked upon endless steel bands which pass through the oven, returning underneath. On emerging from the ovens the biscuits are transferred to conveyors to cool, from which they are packed. (R. T. C.)

BREWING AND BEER. In Great Britain most brewing companies continue to expend large sums of money on the improvement or rebuilding of their licensed property, thereby rendering it more attractive to wider sections of the community. In many breweries plant has been installed for the cooling of beer in barrel before delivery to the licensed house. Many public-house cellars are now fitted with special cooling devices to maintain beer at any desired temperature. The use of stainless steel has been considerably extended for the construction of various types of brewing plant, as well as for public house cellar fittings and beer-raising apparatus.

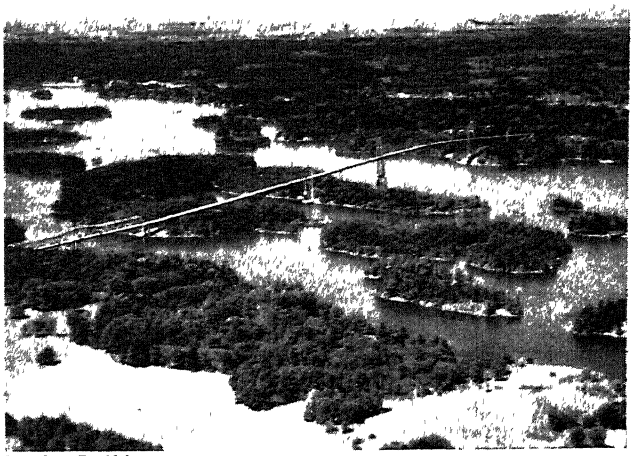
In consequence of the large increase in the quantity of

G. Hopkins & Sons, Ltd.]
AUTOMATIC PASTEURISING MACHINE FOR BOTTLED BEER, WITH A CAPACITY OF 600 DOZEN BOTTLES AN HOUR

G. Hopkins & Sons, Ltd.]
SHEET TYPE STERILIZING FILTER FOR BOTTLED BEER, WITH HYDRAULIC RAM TO TIGHTEN THE PLATES

beer sold in bottle, many improvements have now been effected in bottling machinery. At the present time most large-scale bottling plants are so constructed that bottles may be cleansed, filled, sealed (often pasteurized) and labelled entirely automatically at rates up to and over 6,000 bottles per hour. Methods of carbonation, chilling, and cold storing are constantly being modified and improved. Especially notable have been the introduction of the sterilizing filter, the sterile filling machine, the perfection of a special system whereby beer may be conditioned, carbonated, and cold stored in the entire absence of air, thereby, it is claimed, eliminating the necessity for pasteurization, and the introduction of a method whereby large quantities of highly purified CO_2 gas may be obtained from solid CO_2 blocks.

The research department of the Institute of Brewing investigates the more complex fundamental problems underlying the brewing process. Protracted investigations are directed towards improving the quality and quantity of British brewing barley, while at the same time Empire varieties are frequently being tested for their suitability as brewing materials. Experiments are being continued to find suitable new varieties of hops to replace the imported article. At Birmingham University the research department of the Institute has a complete small-scale experimental brewery in stainless steel installed for experimental work in connexion with the various problems under investigation.



Other problems under consideration are difficult questions regarding the composition of starch, the occurrence and behaviour of proteins in wort and beer, the behaviour of yeast and its nutritional requirements including the possibility of isolating "bios", and the composition of brewing waters. All this work is now under the direction of Sir Gilbert T. Morgan, O.B.E., D.Sc., LL.D., F.R.S.

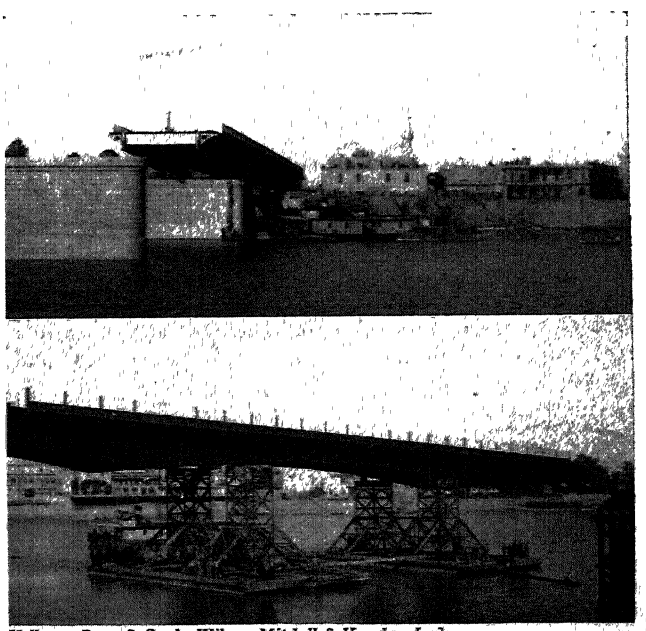
Beer production in United Kingdom (excluding Eire) for the year ending March 31, 1938, was 23,675,621 net bulk bbls. on which the net excise duty was £61,241,404. World production of beer for 1937 (the last official figures) was approximately 186 million bbls. (A. J. C. C.)

BRIDGES. In Great Britain the new Waterloo bridge made progress during 1938; the abutments and piers approached completion and much falsework was placed for span-construction. After 112 years' service, Telford's Menai (suspension road) bridge, Wales, Anglesey, was being reconstructed without, however, changing the appearance. A new (road) bridge over the Dee at Aberdeen was being built.

In the British Empire there was considerable activity in bridge building. On Nov. 14 was brought into use the Lions' Gate (road) bridge, over the Burrard Inlet, Vancouver, Canada. It is the longest suspension bridge in the Empire (1,550 ft., with a clearance above high water of 200 ft., and two smaller side-spans totalling 1,228 ft.; the whole, with approaches, 6,100 ft.). This is a toll bridge, and was built as a private venture by a British company at an estimated cost of $5,500,000.

The Thousand Islands Bridge, joining the United States and Canada across the St. Lawrence River, was officially opened by President Roosevelt and Prime Minister Mackenzie King on Aug. 18, 1938. The dedication ceremonies featured the celebration of 100 years of international peace between the two nations. This crossing, 8½ miles long, utilizes the islands to reduce the span-lengths required. It includes two suspension bridges (main spans 800 ft. and

Canadian Pacific]



THE THOUSAND ISLANDS BRIDGE, UNITING CANADA WITH THE U.S.A., OPENED IN 1938 BY PRESIDENT ROOSEVELT AND MR. MACKENZIE KING. IN THE BACKGROUND IS THE CANADIAN MAINLAND

750 ft.), a steel arch, a continuous truss bridge, a masonry bridge, and connecting viaducts.

Another international bridge completed in 1938 was the Blue Water bridge connecting Port Huron, Mich., and Sarnia, Ont., across the St. Clair River. This is an arched cantilever of 871 ft. span.

Other Empire bridges under construction were the Howrah (road) bridge, Calcutta, India (world's third largest cantilever span, of 1,500 ft.), due for completion in the spring of 1939, and the Brisbane (road) bridge, Queensland, Australia (suspension; 1,463 ft. in three spans, the longest, 924 ft. and the clearance, 114 ft.; contract price, £1,154,000), due for completion July, 1939, but delayed. The latter will be a government-owned toll bridge, and the second longest span in Australia.

United States. Many bridges were in course of construction or of alteration during 1938. On the Henry Hudson

Holloway Bros. & Coode, Wilson, Mitchell & Vaughan-Lee]

THE FIRST SPAN FOR THE NORTH BRIDGE OVER THE RIVER TIGRIS AT BAGHDAD, WHICH WEIGHS 580 TONS, BEING FLOATED OUT AND (ABOVE) BEING LOWERED INTO POSITION ON TWO OF THE PIERS

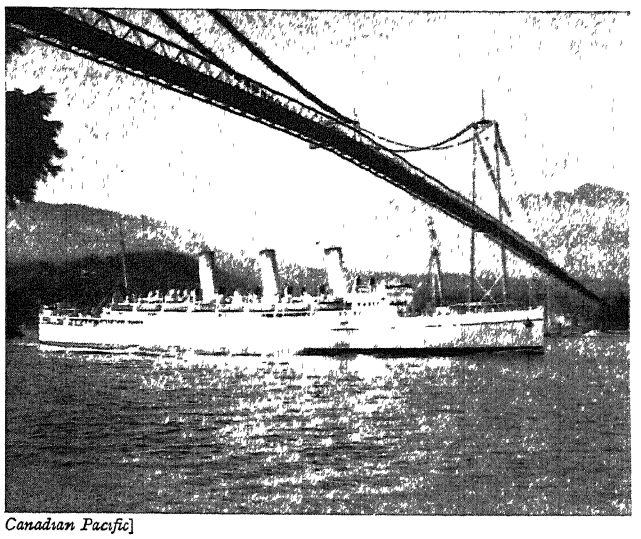
bridge over the Harlem River at New York, opened in Dec. 1936, the addition of an upper deck to double the traffic capacity was soon found necessary, as anticipated by the engineers, and was completed in April 1938. Some 6,500,000 cars used the bridge in the first year, 11,000,000 cars in the second year, each paying a ten-cent toll; and it is expected that the twenty-year revenue bonds will be retired and the bridge will be made free in ten years. This bridge has a main span of 800 ft. Other bridges completed in 1938 include the Cairo (Illinois) bridge over the Ohio River, a multiple cantilever with 800 ft. principal span; and the Port Arthur–Orange bridge over the Neches River, Texas, a cantilever with 600 ft. span.

The Bronx-Whitestone bridge, spanning Long Island Sound, opening May 1939 in time for the New York World's Fair, is a suspension bridge with a main span of 2,300 ft.

Asia. At Baghdad, two bridges over the Tigris reached an advanced stage of construction by a British firm.

In August it was reported that the Chientang double-deck road-rail bridge near Hangchow, China (opened in Nov. 1937), had been destroyed by retreating Chinese forces.

Europe. The largest bridge project now in hand, involving 200,000 tons of steel, is the "Tor der Welt", over the Elbe at Hamburg, to be completed about 1946. This is a suspension bridge with a main span of 2,296 ft., carrying a roadway 154 ft. wide on the upper deck and trains below. The Köhlbrand approach includes a continuous girder span of 854 ft., using four double-web plate girders 33 ft. deep.



The year 1938 was marked by two notable bridge failures. The international Falls View bridge at Niagara Falls, after forty years of service, was carried away on Jan. 27 by an ice jam of unprecedented height. On March 14, a new welded bridge of the Vierendeel truss type at Hasselt, Belgium, suddenly collapsed; the failure is attributed to the application of welding to steel of excessive carbon content.

BRITISH ARMY: *see* ARMY, BRITISH.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE. The annual meeting for 1938 was held in Cambridge (Aug. 17–24). The attendance of members, as was to be expected in this university town, was above the average: nearly 3,000 were present, and that number would have been exceeded but for the fact that the Section of Physiology did not meet, as the date clashed with an International Physiological Congress in Zürich. On the other hand, the accommodation for meetings offered by Cambridge, in lecture rooms, laboratories, and other university institutions, was so unusually ample that some of the Sections were able to organize themselves in two or three departments, and the number of scientific communications was above the usual large figure, amounting to more than 500. The president of the Association was Lord Rayleigh, F.R.S., whose father occupied the same chair in 1884. Lord Rayleigh dealt, in the first part of his presidential address, with vision in nature and vision aided by science, and in the second part with science and warfare: it is to be hoped that in this second part he disposed finally of any belief that the progress of science can be held directly responsible for the horrors of war. Among addresses delivered by presidents of Sections, reference may be made, on the score of their wide interests, to Prof. Griffith Taylor's on geographical correlations and culture, Prof. R. V. Southwell's on the changing outlook of engineering science, Mr. J. Sargent's on the function of administration in public education, and Prof. R. G. Stapledon's on ley farming; while the Earl of Onslow spoke on national parks to the delegates of societies in correspondence with the Association. Among other leading subjects of discussions and papers were the water supply of London, the biology of British food fishes, the growth of health resorts, English ports in their geographical setting, government storage of foodstuffs, unemployment and trade cycles, the educational significance of the cinema and broadcasting, problems of British forestry, agriculture and national employment, the remains of prehistoric man recently discovered at Swanscombe, the mechanism of evolution, and virus diseases of plants.

The wide public interest of many of these subjects is evident, and there were many other such in the programme. Nor has this aspect of the advancement of science ever been neglected by the Association. Nevertheless, for some years there has been a growing belief that the social relations of science demand close and objective study in increasing measure, and a more systematic and widespread presentation to the public. This consideration led the Association to take, at the Cambridge meeting, a decision which may well prove to be one of the most important in its history, namely, to create a new division to deal with the social and international relations of science. The functions of this division are to arrange meetings at the time and place of the annual meetings of the Association, and also elsewhere at other times as occasion may arise; to co-ordinate work dealing with the social relations of science, both at home and abroad; to act in a consultative capacity, and to supply information to organizations, individuals, and the public; to initiate and carry out inquiries and research, and to secure publication of the results thereof. Closer contacts with scientific organizations in other countries are among the objects of the new division implicit in its title; and in this connexion it should be recorded that the Cambridge meeting gave occasion for full discussion between officers of the British Association and a representative delegation from the American Association for the Advancement of Science, on the subject of strengthening the bonds between these two bodies, already closely united by community of objects and methods. Proposals were formulated, and have since been ratified, for reciprocal honorary membership to be extended to certain groups of executive members, and for a regular interchange of lecturers at alternate meetings in Britain and America. (O. J. R. H.)

BRITISH COLUMBIA. The opening of the year saw Canada's westernmost province visited by the Rowell Commission on Dominion-Provincial relationships. It was a visit which aroused considerable controversy, for 32 associated boards of trade told the commissioners that the best remedy for Canada's ills would be the abolition of provincial governments and legislatures. Mr. Pattullo, head of the Liberal Cabinet, however, suggested a reallocation of revenues between the province and the Dominion, a review of provincial debts, and the assumption by the Dominion of responsibility for unemployment relief. Broadcasting in March, after the commission left, he advocated the exclusion of the Japanese from British Columbia, beginning with the expulsion of the large number who were claimed recently to have entered illegally, and the annexation of Yukon to the province. He also undertook to support in Ottawa the speedy starting of the Alaska Highway, which has had an immense advertisement in the United States and will run from the State of Washington through British Columbia and Yukon to Alaska. The building of the road, Mr. Pattullo declared, would solve the province's unemployment for years ahead, and an appro-

priation for surveys for it was later made in the provincial budget.

There were some weeks of disturbances in June and July when a body of unemployed occupied public buildings in Vancouver and Victoria. July saw, on Vancouver Island, the worst forest fire since white men came to British Columbia. The new provincial budget, introduced in November, looked for a revenue even larger than the previous year's record of $31 millions; relief expenditure was put down at $5 millions. In Dec. an amendment to the Provincial income-tax law, to permit a 15 per cent tax on undistributed profits, was introduced in the Legislative Assembly and met with some opposition from business circles.

Area and Population:
Area 366,255 sq. miles.

BRITISH COMMONWEALTH RELATIONS CONFERENCE. The second unofficial British Commonwealth Relations Conference was held at Sydney, N.S.W., Australia, between Sept. 3 and Sept. 17, 1938. The first such Conference had been held at Toronto, Canada, in 1933. The Conference was summoned and organized by the Royal Institute of International Affairs and its sister institutes in the Dominions (except Ireland) and India. The following were the heads of the delegations to the Sydney Conference: United Kingdom, the Marquess of Lothian, C.H.; Australia, the Hon. Mr. F. W. Eggleston; Canada, Mr. E. J. Tarr, K.C.; India, Pandit H. N. Kunzru; Ireland, Mr. Donal O'Sullivan; New Zealand, the Hon. W. Downie Stewart; Union of South Africa, Major P. G. van der Byl. The United Kingdom delegation included a representative of Newfoundland. The Chairman of the Conference was Sir Thomas Bavin, formerly Premier of New South Wales, and the other principal officers were: Vice-Chairman, Mr. David Maughan, K.C.; Secretary, Mr. Ivison Macadam, C.B.E.; Recorder, Mr. H. V. Hodson.

The agenda, which had been prepared in June 1937 by a committee under the chairmanship of Viscount Samuel, G.C.B., opened with a study of the national interests and outlooks of the individual nations of the Commonwealth. The central problem of British Commonwealth relations, as a note to the agenda pointed out, was no longer that of adjusting the constitutional relations of the Dominions with Great Britain, but that of attaining the maximum of mutually advantageous co-operation among a number of autonomous and equal nations. The problems of those several nations, it was contended, were in many ways distinct, and upon their respective interests would largely depend the nature and degree of co-operation desirable between them. The majority of participating Institutes presented written studies of the various aspects of their national interests and policies, and a number of the most important of these documents have been published. Having given further oral consideration to these separate national interests, the Conference divided the rest of its agenda into three parts, namely, economic policies and the nature of co-operation to be applied to them, the political and strategic aspects of external policies, and "the future of the Commonwealth as a co-operative organization". The Conference did not attempt to deal with technical economic questions: the emphasis in this section of its agenda was on the character of the economic problem as a vital element in the whole complex of international relations. The discussion on foreign policy and defence was designed to bring out similarities and divergences of interests and policy in different areas or over different issues. This would help to answer the question, to what extent should Commonwealth co-operation be uniform and comprehensive, to what extent based on group or bilateral understandings within the Commonwealth; and to elucidate the practical possibilities of co-operation in various directions. Under the final part of the agenda the following question was posed: whether there emerged from the discussions any fresh conception of the Commonwealth arising from a re-assessment of the historical and constitutional factors in the light of the present interests and national composition of the individual member nations.

The Conference was entirely unofficial and private and, like the participating Institutes themselves, was precluded by its rules from expressing any corporate opinion on the subjects under discussion, either unanimously or by a majority vote. A full record of the Proceedings, however, including the reports of the recorders of the Conference Commissions and of the whole Conference, has been published (by the Oxford University Press) under the title *The British Commonwealth and the Future*. (H. V. H.)

BRITISH EMPIRE. The British Empire is made up of a number of units differing widely from one another in the method of government and the degree of control exercised from Whitehall. It consists of the United Kingdom comprising Great Britain and Northern Ireland; the self-governing dominions, Australia, Canada, Eire, New Zealand, and the Union of South Africa; India and Burma, to which new constitutions with a large measure of self-government have been granted; the self-governing colony of Southern Rhodesia; the crown colonies, in which the measure of control by the Colonial Office varies considerably according to local conditions; the protectorates, mainly native areas, in which the tribes are encouraged to develop along their own lines; and the mandated territories, entrusted to Great Britain or a particular Dominion by the League of Nations according to the Versailles Treaty.

* Estimates, Dec. 31, 1936.

BRITISH GUIANA. In May 1938 was celebrated the centenary of the first arrival in this Colony of East Indian immigrants, whose descendants and successors now number 143,000. Mr. G. D. Owen, Colonial Secretary, arrived in September, when the Colonial Office Labour Adviser also came to study economic conditions.

Certain estates, on which industrial unrest had developed in the summer, were declared "proclaimed areas". The Colony exported its full quota, 186,000 tons, under the International Sugar Agreement. Wages of field and factory workers were increased from 10 to 25 per cent. Fixation of rice export prices was discontinued but subsequently reimposed. Conditions in the industry were investigated by an expert from the Federated Malay States. There was continued expansion of the bauxite industry. A scheme to assist gold prospectors was sanctioned. An extensive artesian well-drilling scheme, started in 1914 and costing 1¼ million dollars, was completed. In July the Governor appointed a strong local committee to report on the development of the hinterland. (A. A.)

Area and Population :
Area 89,500 sq. miles.
Population (Dec. 31, 1936) 332,898 (Europeans 10,761).
Chief Towns : Georgetown (66,601), New Amsterdam (9,514).
Governor. Sir Wilfred E. F. Jackson, K.C.M.G.
Production 1937 (Export figures) :

Sugar	$7,608,106 (181,574 tons)	Rum	$520,563
Molasses	$297,226	Gold	39,047 oz.
Diamonds	34,566 carats	Bauxite	300,707 tons

Overseas Trade 1938 :

Imports	$10,610,262
Exports, domestic	$13,065,606

Communications 1937 :
Roads : 384 miles of fair surface for motors.
Railways : 79 miles ; 107,012 tons of freight carried.
Finance 1938 :

Revenue	$5,755,689	Expenditure	$5,714,464
Public Debt (Dec. 31, 1937)			£4,525,684
Currency	Accounts kept in dollars		$1 = 4s. 2d.

Education 1937 :
Elementary : 7 Government schools, 2,132 scholars ; 229 aided schools, 48,945 scholars.

BRITISH HONDURAS. Lord Moyne, chairman, and four members of the West Indies Royal Commission, spent from Nov. 25 to Dec. 10, 1938 in this Colony, taking evidence from representative bodies and individuals. A tour of inspection was made in November by the Labour Adviser to the Colonial Office.

Improvement in trade continued. Exports of mahogany, chicle, citrus fruits, and coco-nuts increased. The output of grapefruit, 58,000 boxes, doubled that of 1937. Bananas were adversely affected by weather and other conditions. The revival of the sugar industry in the north progressed. In Stann Creek valley the first commercial factory for cassava starch in the British Empire (outside Malaya) started work in December with an anticipated output of 2,500 tons a year.

The Town Board of Belize was dissolved in January, its work being carried on by three government officials pending the setting up of a new Board in January, 1939.

An amendment to the Constitution provided an additional member of the Legislative Council to give separate representation to Toledo. (A. A.)

Area and Population :
Area 8,598 sq. miles.
Population (est. Dec. 31, 1936) 56,071.
Chief Town, Belize (pop. 1936, 21,683).
Governor. Sir Alan C. Maxwell Burns, K.C.M.G.
Language. English mainly (25 per cent Spanish).
Production 1937 (Export figures) :

Mahogany logs and lumber	$715,786
Cedar logs and lumber	$19,004
Grape fruit, fresh	$31,430
" " canned	$4,663
" " juice	$140
Chicle	$189,186
Bananas	$330,491
Factory output (1937) :	
Sugar	416 tons
Cigarettes	13,527,200

Overseas Trade 1937 :

Imports	$3,981,249
Exports	$2,602,600
Re-exports	$1,179,780

Communications :

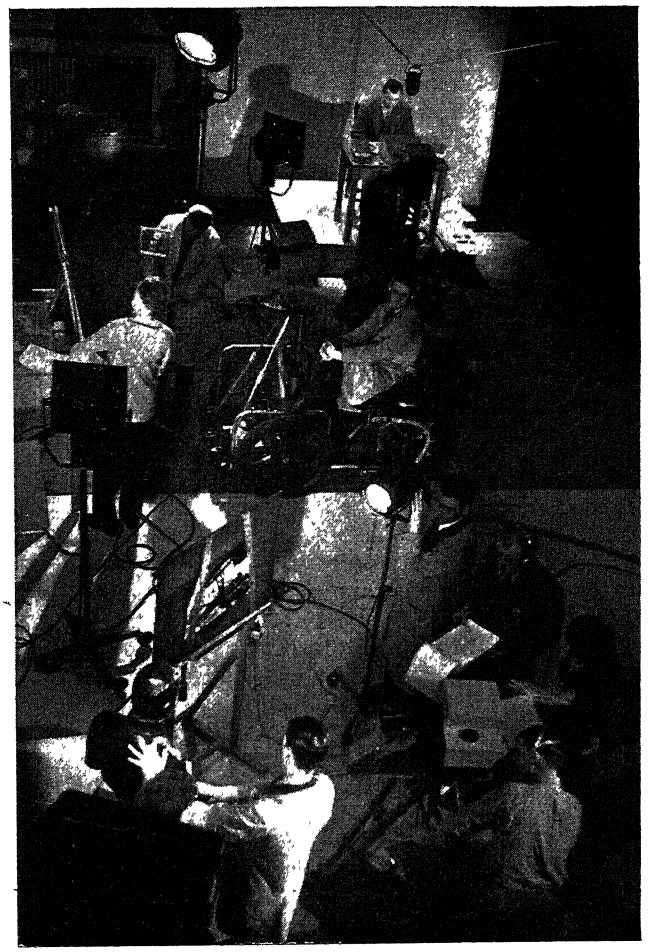
Roads	170 miles open to motor traffic.
Railways	25 miles (3-ft. gauge).

Finance 1938 :
Revenue, $1,092,179 ; Expenditure, $1,250,495.
Public Debt (Dec. 31, 1936) $3,138,188
Currency Dollar ($1)=$1 00 U.S.A.
Education 1936 :
Elementary : schools, 86 ; scholars, 8,916.
Secondary : " 4 ; " 395.

BRITISH LEGION, THE, founded in 1921 by the first Earl Haig to foster the interests of British ex-service-men, now has a membership estimated at over half a million, organized in 4,367 branches, with a women's section (comprising female relatives of members) of 1,800 branches supplying an invaluable complement to its benevolent work. This section maintains, at Burnham Hall, Norfolk, a training school, chiefly for domestic servants.

Among the centrally controlled organizations are : the Poppy Factory at Richmond, Surrey, employing an average of 380 badly disabled men in the manufacture of the 44,000,000 poppies required each Armistice Day ; the Sanatorium and Settlement at Preston Hall, Maidstone (a self-contained village of over 1,000 persons), where is provided the most up-to-date treatment and care of tuberculous cases ; the Pension Fund, which provides 2,000 pensions of 10s. a week for men over fifty years of age who are broken in health and not otherwise pensioned ; the Disabled Men's Sales, which collects and markets goods made by war-disabled men in all parts of the country ; and the Employment Department, which for some years has found jobs for about 40,000 men annually, and has also formed car-parking organizations in many districts and has a training school for taxi-drivers. A separate Officers' Benevolent Department, dealing with necessitous officers and their dependants, assisted some 7,800 cases during 1938.

The year has been marked by continued fraternization with similar organizations in ex-enemy countries (early in September two German generals were admitted to membership), and especially by its offer, early in October—immediately accepted by both the British and the German authorities—to undertake police duties in what were to have been the plebiscite areas of Czechoslovakia. A force of 1,200 picked men under the command of the Chairman, Major Sir Francis Fetherston-Godley, O.B.E., was mobilized, and within three days, starting from nothing, a disciplined, orderly, cohesive body, paid, clothed, and equipped at government expense and furnished with motor transport, motor-cycle corps, ambulances, etc., was ready to sail for service in Central Europe, a hitherto quite unparalleled achievement. After a few days at Olympia, London, they embarked on two troopships at Tilbury ; but on Oct. 15, their services being not, after all, required, they were disbanded. (L. H. D.)



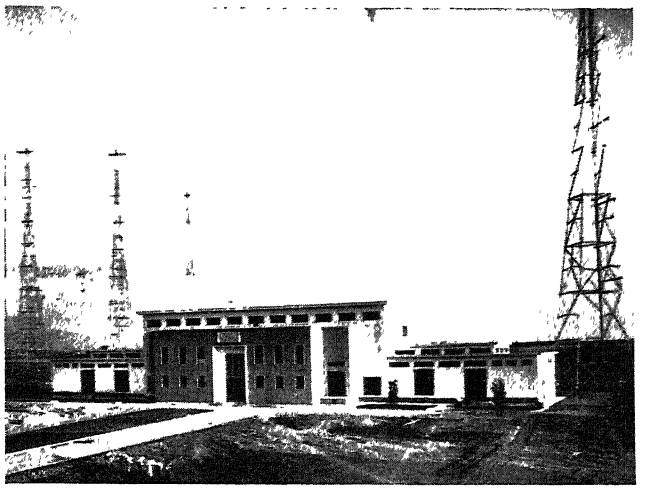
foreign language news services were inaugurated during the year: Arabic, for reception in the Near and Middle East, Jan 3; Spanish and Portuguese, for reception in Latin-America, March 15; French, German, and Italian, for European reception, Sept. 27.

A large number of special broadcasts were arranged for both home and overseas services during the international crisis in September. For example, there were extra news bulletins daily, and many special announcements were made at the request of government departments and various public organizations. Immediate summaries of Herr Hitler's Nuremberg and Berlin speeches were broadcast. Each of the speeches which Mr. Chamberlain made at Heston, before and after his three visits to Germany, were recorded on the spot (by the B.B.C.'s mobile recording unit), and reproduced later in the news bulletins; the speeches made on his return from the three visits were also broadcast "live"; scenes at Heston were successfully televised on two occasions. The prime minister's talk from Downing Street on the night of Sept 27 was broadcast on long, medium, and short waves, and was relayed by a number of foreign broadcasting organizations. It is understood that President Roosevelt and his Ministers listened to it during the course of a meeting at the White House.

Speeches by His Majesty King George VI were broadcast on the occasions of the gathering of delegates of the National Fitness Council at the Guildhall, London; the opening of the Empire Exhibition at Glasgow; and the unveiling of the Australian War Memorial at Villers-Bretonneux. Other aspects of the royal visit to France, and the visit which their Majesties paid to Lancashire earlier in the year, formed the subject of special programmes. The Queen's speech at the launching of the Cunard White Star liner "Queen Elizabeth" was broadcast from Clydebank, when listeners also heard a description of the ceremony.

In the sphere of music—as, indeed, in other spheres of programme activity—the B B C. continued to perform the dual role of purveyor of entertainment and patron of the arts. British broadcasting in 1938 maintained on a permanent contract basis more than 400 orchestral musicians in its Symphony Orchestra and other orchestras in London and the provinces. Its contribution to the London concert world included the B.B.C. Symphony Concerts during the winter season, the summer Promenade Concerts, and the London Music Festival. Toscanini again conducted at the Festival. The B.B.C. continued to collaborate with the leading orchestral and choral societies, both in London and the provinces, and also with the Royal Covent Garden Opera Company.

Numerous plays, either written specially for broadcasting or adapted from stage successes, were broadcast during the year. The "Experimental Hour" provided a platform for new and adventurous forms of writing and technique, while the classics were performed regularly in the "World Theatre" series. Dramatic "feature programmes" dealt with such varied subjects as the Spanish Armada, progress in aviation, legendary monsters, the coal industry, the Franco-Prussian War of 1870, the history of advertising, and the Scottish countryside. Light music and variety, both from B.B.C. studios and music halls and cinemas throughout the country, figured largely in the programmes. Talks and discussions covered topics of every kind, but particular attention was paid to events and movements of the day; notable contributions in this field were series dealing with "The Mediterranean", "Everyman and the Crisis", "The Way of Peace", and "Efficiency and Liberty." The broadcasting of Sunday and weekday services from churches and the studio continued. The major sporting events of the year were broadcast as usual; the number of commentaries on horse-racing increased, and the England *v.* Australia Test Matches were treated even more fully than in the past.



British Broadcasting Corporation]
J. F. HORRABIN AND PROFESSOR W. J. ROSE IN A TELEVISION BROADCAST OF NEWS MAP NO. 7—POLAND—AT ALEXANDRA PALACE, LONDON

The number of schools recorded as listening to the B.B.C.'s special service of School Broadcasts grew in number during the year from 6,890 to 8,453 in England, Wales, and Northern Ireland, and from 881 to 1,141 in Scotland. During the spring some 700 adult Wireless Discussion Groups followed one or other of the current series of talks: for example, the talks on "The Way of Peace", referred to above, attracted 461 groups.

The total amount subscribed to charity by listeners in response to the "Week's Good Cause" appeals, broadcast on Sundays, was over £168,000. In addition, substantial amounts were raised through "emergency" appeals on weekdays (*e.g.* Lord Baldwin's appeal for Jewish and non-Aryan Christian Refugees from Germany). S.O.S. and police messages broadcast from all transmitters during 1938 reached a total of 1,248 as compared with 1,213 during the previous year. Forty-nine per cent of this total were successful.

The short-wave transmissions of the Empire service (as distinct from the foreign language services) continued to fill about eighteen hours a day.

Europe. The year 1938 was one which showed to the full the importance of broadcasting as a link between the

Keystone]
THE NEW ITALIAN SHORT-WAVE TRANSMITTER AT PRATO SMERALDO, NEAR ROME

peoples of Europe. There was a considerable increase in foreign language transmissions—both on medium and short waves—particularly with regard to foreign language news bulletins For instance, both France and Italy extended their foreign news services. British development in this field has been referred to earlier.

Co-operation between the various broadcasting organizations was a marked feature of the year, and the following programmes are examples of the many broadcasts that had a European, and sometimes a world-wide, audience: Concerts from the London Music Festival, conducted by Arturo Toscanini, in May and June; the Sokol Festival in Czechoslovakia, on July 4 and 5; concerts from the Lucerne International Music Festival, in August and September; the Jubilee of Queen Wilhelmina of Holland, Sept 5; and Herr Hitler's speech on the Sudeten German question, Sept. 12. In addition, special international relays were organized by a number of countries in celebration of Christmas and the New Year.

During the year, Greece and Albania started broadcasting services, and Turkey reorganized its service and opened a high-power station in October.

At the end of 1938, Denmark had the highest proportion of wireless licences per head of population in Europe, being followed by Sweden, Great Britain, and Germany. Statistics of the actual number of wireless licences up to the end of Nov. 1938, show the first six European countries to be as follows: Germany, 11,048,261; Great Britain, 8,870,700; France, 4,640,878; Sweden, 1,174,069 (to end of September); Belgium, 1,111,942 (to end of October); Italy, 985,000.

On the technical side, the quinquennial meeting of the International Telecommunications Union was held at Cairo between Jan. 31 and April 8. The conference revised the Radio-communications Regulations laid down by the previous conference held at Madrid in 1932. The principal changes in the waveband allocations to broadcasting are an extension of the medium waveband in Europe up to 1,560 kc/s (down to 192·3 metres); the provision of certain wavebands between 2,000 and 5,000 kc/s for broadcasting in tropical regions; an increase of 500 kc/s for broadcasting on the short wavebands between 6,000 and 22,000 kc/s; and an allocation of ultra-short wavebands for television services in Europe. The International Broadcasting Union was charged with the task of preparing a draft revision of the Lucerne Plan for the allocation of wavelengths to European medium- and long-wave broadcasting stations. This will be considered by a conference of European Administrations in Switzerland early in 1939. (X)

United States. In 1938, for the first time in its history radio established itself as a factor in international politics. It showed national leaders that hereafter they would have to act on a stage before which sat the whole world. Thus, within a few hours after the first German troops crossed the Austrian border in March, the air waves brought eye-witness descriptions of conditions in the threatened capital, followed soon after by broadcasts not only from Vienna, but from London, Berlin, Paris, Rome, and Washington, D.C.

Such crises introduced several new radio devices and techniques. The Mutual Broadcasting System gave American listeners exact recordings of official news reports received by short-wave from all European centres. Thus Americans learned how the German, French, Czechoslovakian, and Italian governments give differing reports of the same event Although technical obstacles in the way of clear short-wave reception have been almost completely eliminated, the recorded programme had the advantage of bringing together all these reports at a definitely fixed hour, convenient for American listeners.

The Columbia Broadcasting System's "European round-up" was a parallel device. In the course of half-an-hour, switch-overs were made from Paris to London to Berlin, to Rome, to Prague for brief reports from American newspaper correspondents and the foreign representatives of the broadcasting company. This presented a balanced comprehensive picture of developments as viewed by trained American observers stationed at different key points, thus enabling the listener to choose and evaluate for himself.

The new practice of fading the foreign-language speeches for interwoven translation, while good radio showmanship, created many difficulties. Many listeners protested that the translators were biased. Until recently these speeches were broadcast in their entirety and then summarized in English. But it was found that by skilful use of the speaker's pauses and the applause periods for quick translation, the original quality and character of the speech were retained and yet the meaning was made immediately available for all listeners.

The two-way conversation combined the latest technical developments with genuine news value. Contact was established between a speaker in America and one in Prague or London. In this way answers to specific questions could be obtained, and the whole country eavesdropped on an exclusive interview. Confirmation or contradiction of certain news reports and rumours could be secured. Frequently, information thus transmitted to a foreign capital had been censored there or had not yet been received. This particular technique proved most valuable when all telegraph and broadcasting services were closed down or reserved for government use.

Another advance for democratic radio in 1938 is in the field of short-wave broadcasts. For years the totalitarian governments have flooded Latin America with their special brands of radio propaganda. In entire accord with the State Department both the National Broadcasting Company and the Columbia Broadcasting System have greatly expanded their short-wave foreign-language programmes during the past year. To-day, the American programmes directed to Latin America surpass German and Italian programmes both in the number of hours and in the more important realm of radio showmanship. N.B.C. alone broadcasts 63 hours per week to South America while the

broadcasts from Germany total only 56 hours An analysis of these hours is also significant Of N B.C.'s 63 hours, 56 are in Spanish and Portuguese, and of Germany's total of 56 only 10 per cent are in those languages. In the news broadcasts to Latin America from the United States, comment and colouring are carefully avoided. The dispatches are brief and factual, greatly enhancing their value to listeners, as compared with those having definite propaganda bias. This is also true of the news short-waved from the United States in German and Italian.

It was the realistic use of fictitious news bulletins soon after the European crisis broadcasts that startled some radio listeners into believing that an army from Mars had landed in New Jersey on a certain night in October. But the dramatization by Orson Welles and the Mercury Theatre of the old H. G. Wells' novel *War of the Worlds* did more than startle the unthinking. It brought up sharply the problem of radio censorship. Immediately after the broadcast there came a cry that such programmes should not be permitted Some newspapers, which have always resented radio as a rival, demanded closer supervision of broadcasting. Radio, they said, is getting out of hand. But the protests soon quietened down. The presidents of the three major networks forbade the further use of fictitious news flashes on dramatic programmes. Communications Commissioner T. A. Craven of New Jersey urged the "utmost caution" to avoid censorship and asserted publicly that America "does not want a spineless radio".

This case revealed the somewhat ambiguous position of the Federal Communications Commission. The law under which it was established in 1934 contains the following provision: "Nothing in this act shall be understood or construed to give the commission the power of censorship". And yet the law gives the seven members of the commission the power to "protect the public rights on the air". And it must do this according to what it conceives to be for the "public interest, convenience, and necessity". The licence of every broadcasting station is subject to renewal or revocation every six months. The commission reviews programme schedules and investigates when charges are brought against a station. A vigorous and lengthy investigation into the charge of monopoly control by the large chains is now under way.

Father Coughlin, the radio priest, created another censorship problem. Following a talk on Station WMCA in which he made statements concerning Jews, the accuracy of which was widely challenged, Donald Flamm, president of the station, demanded advance copies of future talks. When these were not furnished, the Coughlin talks were discontinued. At the close of 1938 a well-organized attempt on the part of Coughlin sympathizers to boycott the station was under way.

There has been a marked increase in the amount of serious music heard on the air, and a great improvement in the general quality of dramatic programmes. Educational series have been enhanced by experience and more alert radio showmanship. Technical improvements have been few, and popularized television seems as far away as ever.

The radio year has been eventful chiefly in demonstrating the growing importance of free and democratic broadcasting. Various European publications have admitted that at the height of the Czechoslovakian crisis only American radio listeners knew what was happening. As one result, America's traditional isolationism disappeared in so far as it was based on complete ignorance or indifference, and its place was taken by a growing consciousness of immediate vital concern in foreign affairs. (H. V. K.)

BRUNEI. A British-protected state in the island of Borneo (*q.v.*).

Area and Population:
Area *c* 2,226 sq. miles
Population (est Dec 31, 1937) 35,963 (Malays *c.* 28,960)

Production 1937:

Oil	566,908 tons
Natural gas	2,830 mill cu. ft
Coal	444 tons
Rubber	1,827 ,,
Cutch (Export)	2,333 ,,

Overseas Trade 1937:
Imports, $2,516,154; Exports, $5,553,428.

BRUSSELS. January saw Flemish students raiding Tongres prison in an attempt to release a Flemish extremist, and Rexist members provoking a fight in the Chamber and a scene in the Senate; while in August the burgomaster of Lombeek Notre Dame was superseded for joining in a Rexist demonstration. In February Mr Hoover laid tributes on the graves of King Albert and Queen Astrid, and was received by King Leopold By March aeroplanes had carried to Croydon some nine tons of gold deposited by nervous Continental Powers. On April 1, at Evère aerodrome, a stratospheric aeroplane was wrecked and the pilot killed. In May a transport company gave 67 per cent of employees bonuses and badges for careful driving Mutually (March) the Belgian and German governments and (September) the Belgian and French governments raised their legations to embassy rank. In December, Ixelles new broadcasting headquarters were opened. Floods (January) and storms (August) were destructive. (H. Fw.)

BUCK, PEARL SYDENSTRICKER (1892–), American novelist and winner of the 1938 Nobel prize for literature, was born at Hillsboro, W.Va., on June 26. The daughter of Chinese missionaries, she spent most of her childhood in Chinkiang, and learned to speak Chinese before she mastered English. She returned to the United States for her advanced education, and graduated from Randolph-Macon college in 1914. From 1921 to 1931 she taught at the University of Nanking. Her first published novel, *East Wind—West Wind* (1929), was followed by *The Young Revolutionist* (1931), *The Good Earth* (1931), *Sons* (1932), *A House Divided* (1935), *House of Earth* (1935), *The Exile* and *Fighting Angel* (1936), and *This Proud Heart* (1937). In private life she is Mrs. Richard J. Walsh.

Press Portrait Bureau]
PEARL BUCK

BUDAPEST. In May, Budapest was the scene of a Eucharistic Congress, attended by the Papal Secretary of State, eight Cardinals, 72 Archbishops, and 100,000 visitors.

Forty thousand temporary lodgings were erected. This was followed by celebrations in honour of St. Stephen, who died in 1038 His "sacred right hand" was taken in procession from Székesfehérvár to Esztergom. The St Stephen's Day celebrations on Aug. 20 were also on an unprecedented scale, the Holy Crown being exhibited for two days, a Congress being held of representatives of the four million Magyars living abroad. (C A. M.)

BUDGET. Sir John Simon was faced with a formidable task in opening his first budget Expenditure, including the self-balancing expenditure of the post office and broadcasting, was estimated to rise from £919,874,000 (actual issues in 1937–38) to £1,024,840,000 in 1938–39. These sums do not include those portions of the defence outlay which were to be met from loan. The 1937–38 estimates had provided £80 millions under this head, of which £64,867,000 had been spent, and the Chancellor now made provision for £90 millions. Even with this omission, the estimates for the defence services showed an increase of nearly £56 millions on the actual expenditure of 1937–38. Civil estimates, partly as a result of air-raid precautions, were up by £30,693,000 on a similar comparison, and the estimate for debt interest and management up by £13,767,000. Some satisfaction, however, was to be drawn from the budgetary result in 1937–38. After bringing in the margin of £10 millions which had been allowed for possible supplementary votes—a figure that was repeated in the 1938–39 budget—actual outlay had fallen short of the estimates for ordinary expenditure by £29,598,000. Of this sum, £10,544,000 represented a contribution to sinking fund from the Fixed Debt Charge. On the revenue side, ordinary receipts totalled £9,480,000 more than the estimates. The result was a surplus of £39,330,000, including the above-mentioned contribution to sinking fund; but if the expenditure met from loan is taken into account there was a true deficit of £25,537,000.

Sir John Simon's estimates of revenue on the basis of existing taxation totalled £914,400,000. The yield of income-tax was expected to rise by £21,014,000, and that of sur-tax by £4,940,000. National Defence Contribution, which had been estimated to yield £2 millions in 1937–38 and had actually yielded £1,420,000, was now estimated to yield £20 millions in its first full year. The figure for customs revenue, which was put £1,300,000 lower than in 1937–38, made allowance for the loss of £4 millions on account of special duties on produce imported from Ireland, which had been remitted under the Anglo-Irish agreement.

The Chancellor thus faced a prospective deficit of £29,998,000. In meeting this, he eschewed all temporary expedients, such as the use of the accumulated profit on the Exchange Equalization Account, that had been recommended to him, and followed instead a path of strictly orthodox finance. The greater part of the required sum was furnished by an increase of the standard rate of income-tax from 5*s.* to 5*s.* 6*d.* in the £. This was estimated to yield £22,250,000 in 1938–39 and £26,500,000 in a full year. The yield in the current year would have been roughly £28 millions but for certain concessions intended to relieve the pinch where it would be felt most keenly: the wear-and-tear allowance for industry was raised; the first £135 of taxable income was exempt from any increase of tax; and tenants were allowed to defer by three months payment of part of their liability under Schedule A (income-tax on property). In order that all classes should contribute to the sacrifices required by rearmament, the Chancellor added 2*d.* a lb. to the existing rates of duty on tea (general, 6*d.* and preferential, 4*d.*). Finally, he raised the tax on petrol and oil fuel from 8*d.* to 9*d.* a gallon, and imposed a duty of 9*d.* a gallon on power alcohol The tea duty would bring in £2,750,000 in 1938–39, and £3,250,000 in a full year; and the other duties £5,350,000 in 1938–39 and £5,675,000 in a full year. The total yield of the new taxation in 1938–39 was thus £30,350,000, leaving a final surplus of £352,000

Two other features of the budget speech need be mentioned. The Chancellor commenced a campaign against tax evasion, introducing clauses to stop certain known loopholes. He also announced that the government, without waiting for financial authorization, had accumulated reserve supplies of wheat, sugar, and whale oil sufficient to feed the population for some time in an emergency. Supplementary estimates would be required to cover this outlay

British Budget, 1938

(000's omitted)

Expenditure	Estimate 1937–38 £	Actual 1937–38 £	Estimate 1938–39 £
Interest and Management of Debt	224,000	216,233	230,000

Total	863,100	872,580	914,000

* Excluding sums to be raised by loan during the year under the Defence Loans Act.

† Excluding margins for supplementary estimates: 1937–38 £10 millions; 1938–39 £10 millions. (H. V. H.)

In spite of economy efforts, the United States budget for 1938–39 was passed unbalanced with expenditure estimated at $6,869 millions and revenue $5,919 millions. Income-tax was expected to yield more, customs duties less, but with the assistance of the social security taxes revenue was estimated at $1,000 millions more than in 1937–38. In spite of an increase in the allocation to the National Defences, expenditure was to be $600 millions lower, and the deficit thus reduced from $2,700 millions to just under $1,000 millions.

The French budget was passed at the beginning of January, 1938, but subsequent financial crises necessitated

a periodic revision of the State's finances. Initially revenue was estimated at Frs. 54,776 millions and expenditure at Frs. 54,739 millions. Receipts were to be increased by the rescinding of the Laval decree that had cut rents by ten per cent and by raising a number of minor taxes M Blum revealed in April that there was a prospective deficit of Frs 4,000 millions on the ordinary budget, quite apart from an extraordinary monetary expenditure of Frs. 15,900 millions. The remedy proposed amounted in effect to inflation combined with strict price control. Revenue was to be increased by a capital levy of 4–17 per cent and a seven per cent tax on rentes. The gold stocks were to be revalued at the new franc rate. The Reynaud plan, estimating ordinary expenditure at Frs. 64,500 millions with an extraordinary expenditure of Frs. 25,000 millions, special government relief works of Frs. 3,500 millions, and a total deficit of Frs. 51,000 millions, followed in November and amounted in effect to the budget for 1939–40.

Belgium anticipated a deficit of Frs. 1,900 millions on the ordinary budget The Crisis Tax, abolished in July 1937, was restored, raising the tax on dividends from 24 to 29 per cent. Estate duty and super-tax were raised, and a progressive tax was imposed on men escaping military service. Duties on beer, tobacco, and petrol were raised

Holland estimated the budget deficit at Fl. 61 millions Ordinary defence expenditure was up by Fl 24·5 millions, and an additional Fl. 73 millions had been earmarked for capital defence expenditure To meet this a new tax was devised, amounting to a levy of two per cent on rents, interest, wages, and profits, to be collected at source. The profits of limited companies were subject to a further eight per cent duty Revenue from this was, however, reduced by provisions to lighten the burden on large families and to prevent uneven taxation of different industries.

Switzerland estimated expenditure at 542·8 million Swiss francs and revenue at 514·8 million Swiss francs. The Crisis Tax was prolonged for one year and super-tax was increased.

Italy estimated revenue for 1938–39 at Lt. 20,596 millions, with ordinary expenditure at Lt. 23,762 millions and extraordinary expenditure Lt. 9,000 millions. This last item did not include special expenditure on defence and on Abyssinia. The minimum deficit was thus Lt. 12,273 millions.

The Polish ordinary budget was balanced at 2,447 million zlotys, one third of which was for national defence, with a special allowance of 200 million zlotys for a four years' public works plan.

The Swedish budget at Kr 1,228 millions was only Kr. 26 millions larger than in 1937. Revenue was estimated to exceed expenditure by Kr. 19 millions, but there were no changes in any of the 1937 taxes.

The Norwegian budget was estimated to balance at Kr 563·4 millions, against Kr. 532·75 millions in the previous year. In effect the year ended with a net surplus of Kr. 36·6 millions.

Denmark estimated income for the year at Kr. 466·9 millions and expenditure at Kr. 462·9 millions, but during the year both revenue and expenses increased and the two items worked out at Kr. 544·6 millions and Kr. 521·1 millions. In addition a special defence bill was voted allowing for expenditure of Kr 50 millions. (D. M. H)

BUILDING AND THE BUILDING INDUSTRY. Building is one of the largest integrated industries in Great Britain, on account of the vast amount of basic material it uses and the large amount of labour it directly or indirectly employs. Unemployment in the building industry means a serious loss in purchasing power to the trading community of the country, and a decline in economic prosperity It is of supreme importance, therefore, that activity in this key industry should be maintained consistently at the highest possible level.

Apart from unemployment, it is a matter of great importance that the operative section of any industry should be protected against involuntary interruption of work, with its consequent loss of wages. Previously, building operatives received no pay for time lost due to stoppages caused by inclement weather. It is a matter for congratulation that a scheme has now been initiated in Great Britain whereby the operatives will receive payment for time lost due to this contingency.

The building industry, during the year 1938, has witnessed the passing of the peak in the volume of building work, and there are indications of a downward trend in the curve of building activity. The decline is most pronounced in private work, possibly owing, in part, to recent world political uncertainties.

In the main it is accounted for by the decrease in the estimated value of approved plans The fall in these figures and the consequent uncertainty this produces provide urgent reasons for rapidly implementing the ministry of health's long-term scheme of public building work (now being compiled by local authorities) as an insurance against recurrent recessions in the building industry.

Factory construction tends to decline, but as an offset to this, a considerable volume of work may be anticipated from an intensification, or prolongation, of the government's rearmament programme.

Stock Exchange values have reflected the decline in the building materials industry, with the exception of certain sections, which have benefited from the increased demand arising from emergency A R.P. work.

While the demand for building from private sources may decrease, that from public sources, however, is likely to increase, resulting from the inception of a definite policy of national defence. This should involve increased building work, consequent upon a more determined attempt to provide permanent structural protection for the population, by means of permanent shelters or suitably designed buildings of a heavier type in steel frame work or reinforced concrete.

Recent preparations for the evacuation of the population from large towns, coupled with the report (recently published) of the Bressey Highways Development Survey for Greater London, has again focused public attention on the urgent need for trunk road development, which, when initiated, will demand the construction of numerous viaducts, fly-over crossings, tunnels, etc.

It should be the aim of all concerned in the building industry to dispel all fears of recession, and to direct their efforts to bringing about a sense of future security which will stimulate world trade and provide the necessary impetus for an increased volume of new building work. (N. KE.)

If the dollar volume of construction activity in the United States in 1938 proved a little larger than in 1937, it is thanks to the quickly expanded public works programme which made up for the drop in private expenditure. According to the Department of Commerce Survey of Current Business, public work during 1938 accounted for 47 per cent of the total, compared with an average of 22 per cent during the 1920–29 decade and 41 per cent in 1937.

From the standpoint of business recovery, the substantial

increase in new residential construction as the year advanced was, perhaps, the most encouraging feature. Moreover, foreclosures continued to decrease, prices of building materials refrained from rising, and a better understanding seemed to be growing of the price ranges within which effective demand for new housing exists The number of family dwelling units upon which construction has started is the greatest since 1929

This activity was stimulated by Congressional legislation early in 1938, lowering the charge for mortgage insurance by the Federal Housing Administration and permitting it to insure mortgages on small homes up to ninety per cent of their value About seventy per cent of the $650 millions in mortgages accepted for insurance during 1938 was on new houses, and over half of these were for more than eighty per cent of appraised value. The encouragement of large-scale rental projects for moderate income groups also continued. By Dec. 17, the F.H A. had insured mortgages aggregating $60,400,000 on 129 projects for 16,000 families, which are either under construction or in operation, and has commitments on 113 others involving mortgages over $47 millions.

Residential building shows great geographic variations, being most active on the Pacific coast, especially in the Los Angeles district. The districts showing the sharpest increase in family units built in 1938 over 1937 are New York and Little Rock.

BUILDING SOCIETIES. The Building Society movement, which had its origin in England (Birmingham) in 1781 and spread, very slowly, to other lands, is to-day probably the most potent thrift agency in Great Britain, if not in the whole world, some 85 per cent of the enormous assets of the societies representing the savings of the people who, through its agency, are gradually being turned into a nation of freeholders Fifteen million people have been rehoused in Great Britain since the close of the World War, and of the 3,600,000 houses built to accommodate them, 2,500,000 have been built by private enterprise, 2,000,000 of which were assisted financially by the societies, which have advanced £1,300,000,000 for the purpose. To-day, well over 1,390,000 citizens of Great Britain are buying their homes through Building Societies, and over 4,268,000 people are associated with the movement either as investors (2,082,652), depositors (793,950), or borrowers (1,391,699).

As the result of mergers the number of societies in Great Britain has shown a decline for many years. In the ten-year periods from 1890, when the number was 2,378, till 1920, they dropped as follows: 2,238, 1,690, 1,276; in 1927 they stood at 1,054, and in 1937 at 977 (of which 856 were Permanent and 121 Terminating), with assets exceeding £710,000,000. Assets increased during the year by over £53,800,000, and the volume of default was infinitesimal. Forty-four societies now have assets exceeding £3,000,000, the largest being: Halifax (£122,626,007), Abbey Road (£50,295,517), Woolwich Equitable (£37,216,067), and Leeds Permanent (£36,965,985).

As will be seen in the table below, 1937 (the last date for which full figures are available) registered a decline in advances, the first since 1932; but the net principal repayments increased by £4,200,000 to £87,144,000—63 per cent of the total advances. Since 1932 the proportion of shares to total assets decreased from 81·1 per cent to 72·9 per cent, and that of assets increased from 13·2 per cent to 19·5 per cent, suggesting that the societies had obtained funds at cheaper rates. In the twenty years 1918 to 1937 the societies lent on mortgage £1,351,000,000, and during the last five years loans were maintained at over £100,000,000 a year

Building Societies: England, Wales, and Scotland

	1913	1919	1927	1936	1937
	£000	£000	£000	£000	£000
Total Assets	65,316	77,347	223,346	656,188	710,053
Share Capital, Depositors, and Other Liabilities	61,535	72,801	211,386	621,690	671,992
Advanced on Mortgage during the year	9,131	15,841	55,887	140,310	136,800
Reserves	3,781	4,545	11,960	34,198	38,062

The second annual general meeting of the Building Societies' Association was held at Cheltenham in June, under the chairmanship of Mr. Walter Harvey, and a committee has been set up to deal with matters affecting the movement. A very successful International Congress of Building Societies, which was attended by some 200 British representatives, was held at Zürich in September. Though revision of Building Society legislation, which has remained unaltered since the Act of 1894, has repeatedly been urged, nothing has yet been done; but in May the Council of the Association decided that applications for finance for timber housing schemes are to be considered on the same basis as schemes for building with brick or other materials. (L. H. D.)

BULGARIA. Early in the year there was considerable excitement owing to the continuance of the authoritarian regime. In March elections—the first since the constitution was suspended in 1934—returned 104 government supporters against 56 of the opposition, three of whom were subsequently disqualified. On May 23, parliament was opened, and the Decree-Laws of the last four years confirmed. On Oct 16 many members of the Zveno group and left-wing Agrarians were arrested, following the assassination of General Peeff, chief of the general staff. On Nov. 9 the government was defeated, and reconstructed on Nov. 14, M. Kiosse-Ivanov remaining premier.

GATHERING THE ROSE CROP IN THE ROSE VALLEY IN CENTRAL BULGARIA, FOR DISTILLING ATTAR OF ROSES

J. Allan Cash

THE BYZANTINE COURTYARD OF RILA MONASTERY, BULGARIA

The most important event in foreign affairs was the signature of the Salonica Agreement with the Balkan Entente (July 31) The latter renounced, so far as they were concerned, the clauses of the Treaty of Neuilly limiting Bulgaria's armaments, as also the clauses of the Treaty of Lausanne demilitarizing certain zones on Bulgaria's frontiers. The signatories bound themselves to mutual non-aggression. The agreement (which the other interested States accepted) was hailed with rejoicing in Bulgaria, where conscription and rearmament were now introduced openly. In the autumn there were rumours that Yugoslavia proposed to grant some territorial concessions, but a communiqué following a meeting of the two premiers at Pirot (Oct. 31) only referred to the "unchangeable friendship" and absence of any misunderstandings between the two countries.

In spite of the overwhelming importance for her of her trade with Germany, Bulgaria did not accept an offer made by that country in October to take over all her export surpluses for twelve years in return for German manufactured goods and services. (C. A. M.)

BURMA. The separation of this country from India for administrative purposes is now complete ; and it enjoys autonomous government on lines similar to those of an Indian province. The Governor is Sir Archibald Cochrane (since April 1937), and a Council of six ministers, with Dr. Baw Maw as premier, carries on the administration. Burma has been hard hit by the decline in its foreign trade, its dealings with Japan, Germany, and the United Kingdom having all fallen off seriously. An alleged insult to the Buddhist faith by a Moslem author was made the pretext for serious rioting in Rangoon, Mandalay, and other districts in July and September. Over 200 persons were killed and more than 900 injured The Governor restored order by making use of his reserve powers to promulgate the Rangoon (Emergency) Security Act, and on Oct. 21 he was able to declare the state of emergency at an end. Animosity to Indian exploitation, however, does not abate ; and at the end of the year there was a civil disobedience movement in Rangoon. (ME)

Area and Population :

BURNET, SIR JOHN (JAMES), British architect, was born in Glasgow in 1857, and died in Edinburgh on July 2, 1938 His father was himself a notable Scottish architect, and Sir John owed much to his influence Among the buildings erected to his design were the Royal Institute of the Fine Arts in Glasgow, the King Edward VII Memorial Galleries added to the British Museum, and the Institute of Chemistry in Russell Square, London. Sir John was knighted in 1914, was elected A R A in 1921, R.A. in 1925, and a Fellow of the R I.B.A. in 1897 He was also a Royal Scottish Academician and a Fellow of the Royal Society of Edinburgh.

P.P Bureau
SIR JOHN BURNET

BUTLER, HAROLD BERESFORD, C B. (1883–), Warden of Nuffield College, Oxford, educated at Eton and Balliol College, Oxford, was a Fellow of All Souls from 1905 to 1912, and entered the British Civil Service in 1907 After holding responsible positions in the Home Office, Foreign Trade Department of the Foreign Office, and Ministry of Labour, he became assistant general secretary to the Labour Legislation committee at the Versailles Peace Conference and one of the original organizers of the International Labour Office, which was set up largely as a result of his success in obtaining financial support from the British government In 1919 he went to Washington as secretary-general of the first International Labour Conference, and in 1920 returned to Geneva to serve as deputy to Albert Thomas at the I L O , succeeding him as director on his death in 1932

On April 28, 1938, Mr Butler resigned the directorship of the I L O , and in June it was officially announced that he had been appointed to the wardenship of the new Nuffield College, Oxford, to take office in Jan. 1939, and to hold it until he is 65.

Mr Butler is married, and has two sons and one daughter; he has studied labour and economic problems in many parts of the world, and, in books, articles, and reports, has published much on them.

BUTLER, SIR (SPENCER) HARCOURT, G C.S.I , G C I E , British Indian administrator, was born on Aug. 1, 1869, and died on March 2, 1938 He was educated at Harrow and Balliol College, Oxford, and entered the Indian Civil Service in 1888 He held posts as Settlement Officer, Deputy Commissioner of Lucknow, and Secretary of the Foreign Department of the Government of India, and was Lieut.-Governor of Burma, 1915–17, Lieut -Governor, 1918–21, and Governor, 1921–23, of the United Provinces of Agra and Oudh, and Governor of Burma, 1923–27. In 1928 he became chairman of the Indian States Committee. In 1931 he published *India Insistent.*

G

CABINET MEMBERS. The composition of the Cabinets of the United Kingdom and the British Dominions, and of the United States, at the close of 1938 was as follows

United Kingdom

Prime Minister and First Lord of the Treasury	The Rt Hon Neville Chamberlain
Chancellor of the Exchequer	The Rt Hon Sir John Simon, G C S I, G C V O, O B E, K C
Lord President of the Council	The Rt Hon Viscount Runciman
Lord High Chancellor	The Rt Hon Lord Maugham
Secretary of State for Home Affairs	The Rt Hon Sir Samuel Hoare, Bt, G C S I, G B E, C M G
Secretary of State for Foreign Affairs	The Rt Hon Viscount Halifax, K G, G C S I, G C I E
Lord Privy Seal	The Rt Hon Sir John Anderson, G C B, G C S I, G C I E
Secretary of State for Dominion Affairs * / Secretary of State for the Colonies	The Rt Hon. Malcolm MacDonald
Secretary of State for India and for Burma	The Most Hon Marquess of Zetland, G C S I, G C I E.
First Lord of the Admiralty	The Rt Hon Earl Stanhope, K G, D S O, M C
Secretary of State for War	The Rt Hon L Hore-Belisha
Secretary of State for Air	The Rt Hon Sir Kingsley Wood
Minister for the Co-ordination of Defence *	The Rt Hon Sir Thomas Inskip, C B E, K C
Secretary of State for Scotland	Lt-Col the Rt. Hon D J Colville
President of the Board of Trade	The Rt Hon Oliver Stanley, M C
Minister of Agriculture and Fisheries *	The Rt Hon W S Morrison, M C, K C
President of the Board of Education	The Rt Hon Earl De La Warr
Minister of Health	The Rt Hon Walter E Elliot, M C
Minister of Labour	The Rt Hon. Ernest Brown, M C.
Minister of Transport	The Rt Hon Leslie E. Burgin, D C.I
Chancellor of the Duchy of Lancaster *	The Rt Hon. Earl Winterton

* In Jan 1939 the following cabinet changes were announced Dominion Affairs, Sir Thomas Inskip; Co-ordination of Defence, Admiral of the Fleet Lord Chatfield; Agriculture and Fisheries, Sir Reginald Dorman-Smith; Chancellor of the Duchy of Lancaster, W. S. Morrison

Northern Ireland

Prime Minister	The Rt Hon Viscount Craigavon, D L
Minister of Finance	The Rt Hon J M Andrews, D L.
Minister of Home Affairs	The Rt. Hon Sir Richard Dawson Bates, Bt., O.B E., D L.
Minister of Labour	The Rt Hon. John F Gordon
Minister of Education	The Rt Hon J. H Robb, K.C.
Minister of Agriculture	The Rt Hon Sir Basil S. Brooke, Bt, C B E., M C, D L.
Minister of Commerce	The Rt Hon J. Milne Barbour, D.L

Eire

Prime Minister and Minister for External Affairs	Eamon de Valera, LL D
Deputy Prime Minister and Minister for Local Government and Public Health	Sean T O'Kelly
Minister for Justice	Patrick J Ruttledge
Minister for Industry and Commerce	Sean F Lemass
Minister for Finance	John McEntee
Minister for Agriculture	James Ryan
Minister for Defence	Frank Aiken
Minister for Education	Thomas Derrig
Minister for Lands	Gerald Boland
Minister for Posts and Telegraphs	Oscar Traynor

Australia

Prime Minister	Rt Hon J A Lyons, P C, C H
Minister for Commerce	Rt Hon Sir Earle Page, G C M G, P C, M D
Attorney-General and Minister for Industry	Rt Hon R G Menzies, P C, K C
Minister for External Affairs	Rt Hon W M Hughes, P C, K C.
Treasurer and Minister-in-Charge of Development and Scientific and Industrial Research	Hon R G Casey, D.S O, M C.
Minister for Civil Aviation and Works	Hon. H V C. Thorby
Minister for Defence	Brig the Hon A G. Street
Postmaster-General	Hon A C Cameron
Minister for Trade and Customs	Hon J A Perkins
Minister for Health and Minister for Repatriation	Senator the Hon H S Foll
Minister for the Interior	Hon J McEwen
Vice-President of the Executive Council	Senator the Hon George McLeay
Minister without Portfolio	Senator the Hon A. N. MacDonald
Minister without Portfolio	Hon. V C Thompson
Assistant Minister-in-Charge of Territories	Senator the Hon E J. Harrison

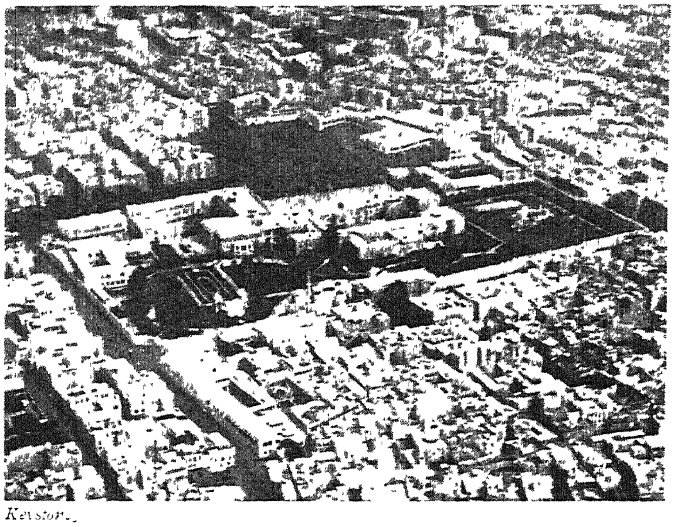
Canada

Prime Minister, President of the Privy Council, and Secretary of State for External Affairs	Rt. Hon W L Mackenzie King, C M G
Minister of Finance	Hon Charles Dunning
Minister of Justice and Attorney-General	Rt. Hon E Lapointe, K C
Minister of Trade and Commerce	Hon W. D Euler
Minister of National Revenue	Hon. J L Ilsley, K C.
Minister of Labour	Hon Norman McLeod Rogers
Minister of Transport	Hon C D. Howe
Minister of Mines and Resources	Hon. T A Crerar
Minister of Agriculture	Hon J G Gardiner
Postmaster-General	Hon J C. Elliott, K C
Minister of National Defence	Hon Ian Mackenzie
Minister of Pensions and National Health	Hon. Charles G Power
Minister of Fisheries	Hon. J E. Michaud
Secretary of State	Hon Fernand Rinfret
Minister of Public Works	Hon. P J. A Cardin
Minister without Portfolio	Hon R Dandurand

New Zealand

Prime Minister, Minister of External Affairs, Native Minister, Minister for Cook Islands, and of Broadcasting	Rt Hon M J Savage P C
Minister of Education, Health, and Marine	Hon P Fraser
Minister of Finance, Customs, and Marketing	Hon W Nash
Minister of Industries and Commerce, and Railways	Hon D G Sullivan
Attorney-General and Minister of Justice	Hon H G R Mason
Minister of Labour and Immigration	Hon H T Armstrong
Minister of Public Works and Transport	Hon R Semple
Minister of Internal Affairs and Pensions	Hon W E Parry
Minister of Mines	Hon P C Webb
Postmaster-General and Minister of Defence	Hon F Jones
Minister of Agriculture	Hon W Lee Martin
Minister of Lands	Hon F Langstone
Minister without Portfolio	Hon M Fagan, M L C

Union of South Africa



Prime Minister and Minister of External Affairs	Gen the Hon J B M Hertzog
Minister of Mines, Social Welfare, and of Education	Col the Hon Deneys Reitz
Minister of Interior and of Public Health	Hon R Stuttaford
Minister of Commerce and Industries and Minister of Defence	Hon O Pirow, K C
Minister of Finance	Hon N C Havenga
Minister of Justice	Gen the Rt Hon J C Smuts, P C, C H, K C
Minister of Post and Telegraphs, and of Public Works	Senator the Hon C F Clarkson
Minister of Agriculture and Forestry	Col the Hon W R Collins
Minister of Railways and Harbours	Hon A P J Fourie
Minister of Lands	Gen the Hon J C G Kemp
Minister of Labour	Hon H G Lawrence
Minister without Portfolio	Hon R Henderson

United States of America

Secretary of State	Cordell Hull
Secretary of the Treasury	Henry Morgenthau, Jr
Secretary of War	Harry H Woodring
Attorney-General	Homer S Cummings *
Postmaster-General	James A. Farley
Secretary of the Navy	Claude A Swanson
Secretary of the Interior	Harold L Ickes
Secretary of Agriculture	Henry A Wallace
Secretary of Commerce	Harry L Hopkins †
Secretary of Labour	Frances Perkins

* Retired Jan 2, 1939; succeeded by Frank Murphy
† Sworn in Dec 24, 1938, to succeed Daniel C Roper

CAIRO. The transformation which the capital of Egypt has been undergoing during the past two or three years continued during 1938. Many well-known buildings have been pulled down, notably the picturesque French Legation which, following the general trend, has removed to the west bank of the Nile Skyscrapers are replacing the older buildings. But, in spite of this, Cairo, although rapidly losing its oriental character, is becoming quite a handsome city. A contributory factor has been the reduction in the pavements in the main streets rendered necessary by the increase in the use of the motor-car The introduction of the one-way system has considerably relieved the congestion of traffic

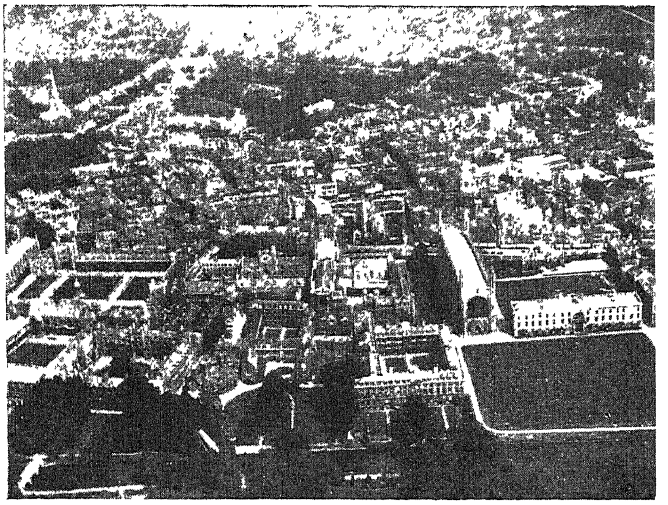
Keystone

AERIAL VIEW OF CAIRO SHOWING THE ROYAL PALACE

The city was *en fête* for three days in January for the marriage of King Faruk (Jan 20), and again in November popular rejoicing was great when the birth of the first child of that marriage, Princess Ferial, was announced (Nov 18)

The 18th International Cotton Congress was held in Cairo at the end of January, and the International Tele-Communications Conference in February. (A MN.)

CALCUTTA, on the river Hoogly and its suburb Howrah, on the opposite right bank, have between them a population of nearly 1½ millions The municipal administration is strongly nationalist in character There has been considerable labour unrest during 1938, and the recession in the jute industry has affected the general prosperity of the city. The improvement trust pushes on rapidly with the clearance of slum areas and the construction of broad roads At the end of June, the first through flying-boat arrived in the new air service to Australia



CAMBODIA: *see* FRENCH INDO-CHINA

CAMBRIDGE UNIVERSITY. During the academic year 1937–38 the total number of matriculants was 1,728. There were 5,255 students *in statu pupillari*, including 84 officers of the Royal Engineers, Air Force, and Corps of Signals, and 85 probationers of the Indian, Colonial, and Sudan civil service In addition, there were 496 students at Girton and Newnham Research students continue to increase, the latest official figure being 384

In many departments the numbers have outgrown the capacity of the staffs, and this development, together with the increasing number of departments, has entailed a curtailment of new expenditure. Without an increase of income the university may necessarily be faced with compulsory limitation of numbers in more congested departments.

Four new professors have been elected to chairs vacant by death or retirement, namely, Physics, International Law, Economic History, and Hebrew.

A new chair of Education has been established, and the Training College for Schoolmasters which was founded in 1891 will become the Department of Education. The association of the university with the training of teachers began in 1879, for in that year the Teachers' Training

Sport & General]
CAMBRIDGE AERIAL VIEW OF THE "BACKS"

Syndicate was formed, which established the first English university certificate in education in 1880. The new department is the logical outcome of these pioneer activities, it will admit women and bring Cambridge into line with other universities.

During the year benefactions have been received for the study of Sanskrit, Classical Archæology, Experimental Zoology, Medicine, Metallurgy, and Radio research. The laboratory of Experimental Psychology is being extended by the aid of a generous grant from the Rockefeller foundation and a legacy. Other extensions have been made to laboratories, and a most imposing department of Anatomy, dominating the surrounding laboratories, has been built. The Pitt Press, long the offices of the Registrary, has reverted, in a modernized form, to the university printer, and the Press has also built a handsome building in Euston Road, London, appropriately named Bentley House, for its vast book trade.

Owing to the European crisis the Michaelmas full term, 1938, began four days late. (C. Fo.)

CAMEROONS. The British mandated territory of the Cameroons is administered as part of the neighbouring territory of Nigeria . the same system of indirect rule has been introduced and where possible native treasuries under the tribal authorities receive a percentage of tax. German estates auctioned after the War were to a great extent repurchased by German bidders, and the majority of estate owners are German. The French area retains a separate status under a Commissioner of the Republic, who is a member of the council of French Equatorial Africa. Here the former German owners of estates did not succeed in regaining their holdings to any extent; and the German population is a small minority. Agricultural production is largely in the hands of African peasant farmers. to develop agriculture the French have organized "Sociétés de prévoyance", which dispose of an annual revenue of over 1½ million francs. (J. L. K.)

The area of the British mandated territory is 34,081 sq. miles, and the population (est. 1937) was: Africans, 830,695; Europeans, 408.

Statistics for the French mandate are as follows:

Area and Population:
Area 161,200 sq. miles.
Population (est. Dec. 31, 1936) 2,390,000.
Chief Town: Yavundé (capital).
Commissioner. M. Boisson.

Production:

Maize (1936–37)	34,200 metric tons
Cocoa export (1936–37)	26,500 ,, ,,
Ground nuts (,,)	37,200 ,,
Palm oil export (1937)	10,000 ,, ,,
Gold (,,)	500 kilograms

Overseas Trade 1937:

Imports	257,969,000 francs
Exports	263,367,000 ,,

Communications 1937:

Roads, motor	3,106 miles
Railways, open for traffic	313 ,,

Finance 1938:

Revenue	107,762,000 francs
Expenditure, ordinary	98,392,000 ,,
,, extraordinary	9,370,000 ,,

CAMPING, CANOEING, AND CARAVANNING.

Campers attending the sixth international rally of the Federation of Camping Clubs at Stresa, Italy, were guests of the Piedmontese Camping Club. Delegates represented nineteen clubs and ten countries. Mr. J. A. C. Champion, chairman of the Camping Club of Great Britain and Ireland, was presented, at the rally, with the gold medal of the French Ministry of Physical Education. Portugal organized a new club, and the Belgian club celebrated the honour of the title "Royal" by a meet at Tervueren at Whitsun.

The Camping Club of Great Britain and Ireland organized in April an open-air exhibition opened by Mr. Kenneth Lindsay, M.P., and attended by 12,700 visitors. The club's Empire Exhibition site at Glasgow was visited by 15,000 campers. A national liaison committee was set up to exchange views on camping matters with the Royal Automobile Club. The Middlesex County Council opened sites at Denham Court, Grim's Dyke, and Theobald's Park, which are supervised by the Camping Club.

World canoe championships were held at Vaxholm, near Stockholm, Sweden. Sweden won six events, Germany four, Czechoslovakia two, and Finland one. Seventeen nations entered for events. The Polish Canoe Club held an international meet on the Brda River, and canoeists attended the international camp at Stresa. The Easter meet of the British Canoe Union on the Churnet, Dove, and Trent was attended by 85 canoeists. The largest British meet yet held was the Port of London meet of the Canoe Section of the Camping Club, with 140 canoeists.

Over 200 caravans attended the Whitsun rally of the Caravan Club at Warwick Park. At the opening of Brighton's municipal camp site, fifty caravans of members of the British Caravanners' Club took part, and four of these crossed Europe to attend the international camp at Stresa.

The King visited the "Duke of York's Holiday Camp" at Southwold, Suffolk, which he founded seventeen years ago. The Seaside Camp for London Boys opened a fund to buy a site at Walmer Castle. Sir Percy Everett, treasurer of the Girl Guides' Association, opened "The Shaws" camp, near Cudham, Kent, in May. The land, for the use of girls from the metropolitan area, was presented by the City Parochial Foundation. A party of English public schoolboys visited Kagawong Camp, Ontario, which is run by Canadian boys.

The Mayor of Brighton opened the first municipal camping ground on May 14. The site, of eighteen acres, adjoins a thirty-acre sports ground.

There are now over 150 holiday camps in Great Britain accommodating about 40,000 people. The National Federation of Permanent Holiday Camps has 36 camps with inspectors who visit them unexpectedly. The mini-

mum accommodation required is draught and rain-proof chalets of wood or brick, electric light, running water, and spring beds for one to four persons in each chalet. Butlin's camp at Clacton-on-Sea accommodates 1,500 people, and at Skegness, 1,800 visitors can be accommodated in 600 chalets. The railways offer camping coaches, of which there are 400 scattered over the country

Germany returned to membership of the International Federation of Youth Hostels, whose conference was held in Switzerland in August. The Youth Hostels Association membership increased to over 79,000, and the number of hostels to about 280, with 10,000 beds. A new hostel, towards which the King George's Jubilee Trust granted funds, was opened at Malham in Yorkshire (V. R.)

United States. There are about 50,000 trailers used for pleasure and business in the United States. There are two large and active trailer societies, the Automobile Tourist Association and the Tin Can Tourists, both of them composed mostly of people who use their trailers as homes while they tour about the country.

Modern trailers are equipped with many conveniences, such as cooking-stoves, heating-stoves, electric-light circuits, running water, refrigerators, toilets, shower baths, and, in the larger trailers, bath tubs. Modern trailer camp sites often supply city water, gas, and electricity which can be connected to the trailer. Proper sanitary regulations of camp site and trailer homes are adopted on many public and private camp sites.

CANADA. A self-governing British Dominion of North America; capital, Ottawa; governor-general, Lord Tweedsmuir; prime minister, W. L. Mackenzie King, area, 3,694,863 sq. miles; population (1931) 10,376,786, estimated (1937) 11,100,000.

History. The Dominion government continued under the administration of the Liberal Party, with Mr. Mackenzie King as prime minister, elected to power Oct. 14, 1935. Saskatchewan (*q.v.*) was the only province to hold a general election during 1938, when on June 8, the Liberal Party under Mr. W. J. Patterson was again returned to power, gaining 38 of the 52 seats. In Quebec there were four important by-elections during the year, in each case the National Union Government, which came into power under Mr. Maurice Duplessis in the general election of Aug. 17, 1936, scored a re-endorsement by the victory of its candidate. Of importance in the political field was the resignation of the Rt. Hon. R. B. Bennett, leader of the Conservative Party of the Dominion since 1928, and premier from Aug. 1930 to Oct. 1935. Dr. Robert J. Manion was appointed his successor at the Conservative convention held at Ottawa July 5, 6, and 7, and the official name of the party was changed from Liberal-Conservative to National-Conservative. The Hon. Earl Rowe, leader of the opposition in the Ontario parliament since 1936, also resigned from office and Col. George Drew was appointed leader of the Conservative Party at a convention held in Toronto on December 8 and 9.

In the province of Alberta the government continued under the Social Credit Party of Mr. Wm. Aberhart, the premier, but none of the important social credit principles were placed in operation (*see* ALBERTA).

A royal commission of five was appointed in Aug. 1937 with the Hon. N. W. Rowell, chief justice of Ontario, as chairman to investigate the economic and financial basis of the constitution, in the light of economic and social developments of the last ten years, which may lead to the revision of the British North America Act. During the last months of 1937 and during 1938 the commission visited each province and the federal government departments and national organizations in Ottawa. They have met with representative groups, including the Governments of the provinces, the Canadian Manufacturers' Association, the Canadian Bankers' Association, the Canadian Medical Association, etc. Owing to ill health, Mr. Rowell had to resign his position both on the commission and the bench. In Dec. 1938 the commission was preparing its report, which it was expected would be one of the most important subjects dealt with during the Dominion parliament, opening in Jan. 1939. The commission met with opposition from the premiers of Ontario, Alberta, and Quebec, all refusing to acknowledge the right of the federal government to assume the functions involved.

[High Commissioner for Canada]

VIEW OF QUEBEC FROM THE HARBOUR

Another document presented to parliament during 1938 (April) was a 180,000-word report by the Turgeon royal commission investigating the textile industry in Canada. The report alleged that hours of labour in the Canadian textile industries "are on a par with those of India, China, and Japan", and urged shorter hours without decreasing wages, and recognition of the workers' right to organize. A report was also tabled in the House of Commons (May) from another royal commission under Mr. Justice Turgeon on the grain trade, and a report (June) on prison reform by the Archambault royal commission.

Public interest in Canada in the month of September centred round the gathering war crisis in Europe, which obviously involved the question of the international status of Canada and the problem of participation in a European war. The tone of the press and of public opinion was overwhelmingly in support of the attitude of Great Britain. No official declaration of policy, however, was made until Sept. 27, when the prime minister announced that the government of Canada was "in complete accord with the statement made by Mr. Chamberlain," and that the government was "making preparations for the immediate summons of parliament should the effort to preserve the peace fail." The obvious implication was that the Canadian parliament could alone decide on peace and war. This formal attitude was universally accepted, but the feeling was almost equally universal that participation in a war forced upon Great Britain was inevitable. Here and there dissentient opinions were expressed as, after the crisis, by a large gathering of French Canadian students in Quebec city.

Among events of interest was the official announcement in October of the visit of the King and Queen to Canada and the United States in May 1939 Sir Gerald Campbell arrived in Canada (October) to succeed Sir Francis Floud as British High Commissioner to Canada The Hon Ernest Lapointe, minister of justice, was head of the Canadian delegation to the September meeting of the Assembly of the League of Nations in Geneva. The Hon Philippe Roy, Canadian minister to Paris, retired from the post after a long period of service President Roosevelt visited Canada during August in connexion with the opening of the Thousand Island bridge at Ivy Lea, and was awarded an honorary degree from Queen's university.

Events in the world of art and letters were the various regional drama festivals and the Dominion festival in May The largest exhibition of Canadian art ever held outside the Dominion was an exhibition of a "Century of Canadian Art" shown at the Tate Galleries in London. It was opened on Oct 14 by the Duke of Kent, and contained 360 exhibits representing 120 artists of the past and present. Sir Ernest Macmillan, principal of the Toronto Conservatory of Music and dean of music at the University of Toronto, was elected honorary member of the Royal Academy of Music in London The National Eucharistic Congress was held on the Plains of Abraham (Quebec) in June, with an attendance of over 50,000, Archbishop Villeneuve was appointed by the Pope to act as cardinal-legate

The close of the year 1938 was saddened by two disasters in the mining industries, one in the Nova Scotia mines and one in Thetford Mines, Quebec, involving a total loss of 27 lives with many injuries

In 1938 death gathered its annual toll, including among those eminent in Canadian life (January) Charles Duquette; Rev. Canon James Fee; Sir J Douglas Hazen; Sir Wm Stavert, Rt Hon. Sir George Perley, Lord Atholstan. (February) Hon. Dr W F Roberts (March) Dr D H. McCalman, Hon Walter Scott. (May) Dr Robert Tait MacKenzie, Mrs W D Herridge; Richard Deans Waugh (June) Col J. L. Biggar. (July) Lady Hickson, Dr P H Bedard; Francis Robert Latchford, chief justice of Ontario Supreme Court (September) Sir Andrew Macphail, James Simpson (October) Dr Arthur MacKenzie; Countess of Ashburnham, Sir Henry Gray; Dr J. Aubrey Lippincott, Rt. Hon Lord Shaughnessy, Most Rev. J A Fredericton Richardson, Frank Arnoldi, K C (November) H Rowatt, Canon S. Gould (December) Sir John Aird

Banking and Finance. Figures for the national income for Canada for 1938 were not yet available at the end of the year. During 1937 it had reached 78 per cent of the prosperity peak of 1929, but it is certain that it will not be as high for 1938. A growth in the income from agriculture, the service industries, and possibly mining is anticipated, but this will be too slight to offset the decline in other industries. Total federal revenue from April 1 to Sept 30, 1938, was $287,468,333 as compared with $280,923,965 for 1937, but total expenditures for 1938 amounted to $235,669,317 as against $227,032,144 for 1937 For the seven-month period ending Oct 31, 1938, the budget position was down some $10 millions from that of the corresponding date in 1937 Bank debits in Sept. 1938 at $2,654 millions showed a decline from $2,733 millions in Sept 1937 By an Act of parliament the constitution of the Bank of Canada was amended to eliminate all private holding of shares

Trade and Communication. Canadian trade for 1937 had reached the highest mark since 1930, with Canada in the fifth rank in world trade The recorded figures for export trade for the twelve months ending Sept 1, 1938, totalled $1,020 millions, a decline of $150 millions from the same period for 1937. Imports of $722 millions showed a decline of $55 millions, total trade was down 11 per cent with a decline of $206 millions, while the favourable trade balance was reduced from $393 millions to $298 millions In arriving at these figures, non-monetary gold coin has been left out as, during 1938, about half of the export of gold took the form of coin instead of bullion Bullion is regarded in trade statistics as merchandise and coin is not; therefore, although the export of gold showed a decline of $59 millions, in actuality $48 millions of this was exchanged for gold coin at the Bank of Canada and shipped in this form

One of the chief reasons for the decline of export trade was the reduction of wheat export (showing a decline for 1938 from that of 1937 of 50 per cent, the 1938 crop not being shipped until September) owing to the shortage of the Canadian supplies resulting from the crop failures of 1937. Moreover, the average level of export prices was 5 per cent lower than the previous year, and the markets of the United States were severely crippled by a business recession. For the six-month period ending June 1938, the export trade to the United States showed a decline of nearly 50 per cent The export trade figures for the last months of the year, however, showed an improvement towards the 1937 mark, increasing from a 34 per cent decline in June, and 27 per cent in July, to only about 12 per cent in September

One of the most important developments of the year was the revision and extension for three years of the Reciprocal Trade Treaty of Jan 1936, between Canada and the United States.

The following table is from the *Monthly Commercial Letter* of the Bank of Commerce for Aug 1938, showing export trade, excluding gold coin.

Export Trade

	Six months ending June ($000 omitted)	
	1937	1938
	$	$
Total Exports	528,320	391,076
British Empire	224,580	212,940
Non-Empire	303,739	178,137
United Kingdom	175,961	160,933
United States	241,238	121,816
Continental Europe (ten countries)	31,617	25,443
South and Central America (eight countries, including Cuba and Mexico)	8,403	7,916
Asia		
China and Japan	15,338	11,500
British India	2,900	1,579
Australasia	19,586	24,893
British West Indies	5,724	5,408
British South Africa	8,277	7,701

Revenue from tourist traffic was less than that for 1937, the preliminary estimates for the Dominion for 1938 being $275 millions as compared with $295 millions tourist expenditure for the previous year

Railways. For the first half of the year 1938, the Canadian Pacific Railway and the Canadian National Railway showed heavy losses over 1937 The C.N.R. had a net operating deficit for the half-year of $5,600,000, compared with an income of $6,700,000 in the same period for 1937. The net operating income of the C P R. fell from $8,300,000 to $2,700,000. The heavy movement of grain

Canadian National Railways]
STOOK GATHERER USED IN THE 1938 HARVEST WHICH SAVES MUCH PITCHING AND LOADING

improved conditions during the last quarter of the year carloadings for September and October being the heaviest for years

Aviation Negotiations were made during 1938 for the manufacture of aeroplanes and war-craft in Canada for the British Army. A group of officials of the British Air Ministry visited Canada in July to negotiate with Canadian authorities By Sept 10, final arrangements were brought to a close and a new organization was formed, with a board of directors chosen from various Canadian companies and banks to take charge of the project Two new assembly plants are to be established, one near Montreal, the other between Toronto and Hamilton The placement of these orders has been a stimulus to Canadian business.

In civil aviation the year was marked by the initiation of a Trans-Canada Air Service (Montreal-Ottawa-Toronto-Winnipeg-Vancouver), operating daily in each direction, carrying for the present only mail, freight, and express.

Agriculture, Manufactures, Mineral Production. The agricultural situation was decidedly improved by the large crop of the season and the heavy export of the autumn, although the enormous world wheat crop, estimated at 4,328,000,000 bushels, showing an export surplus too great for present import requirements, threatened a low price and a heavy carry-over for Canadian wheat The railway situation continued as a heavy drain on national income, offset in some measure by continued high mineral production, although the production of iron, steel, and copper, as likewise of newsprint, stood below the 1937 level. The most pleasing feature of the situation was the high credit of the Dominion, and of its leading provinces. The price of Dominion securities corresponds to a power to borrow at 3 per cent, with the leading provinces at the same figure. Bank deposits and the exchanges show a continuous tendency towards the removal of funds into Canadian investment, due in part at least to the insecurity of all European markets. There is every likelihood that this movement will assume still larger proportions, and carry with it new prospects for migration and internal development. Seen in this light, the industrial situation is not only sound, but distinctly encouraging for the stability of investment. The heavy burden of railway deficits and western mortgage interest would automatically be lightened with such a stimulus to development.

The year 1937 closed for Canada with the highest national income since 1930 ($5,000 millions), a record production in mining, fishing, and chemical industries, and an advance in all branches of manufacture and industry despite the failure of the western grain crops Business activity averaged more than 10 per cent over 1936 and 56 per cent over 1932, the worst year of the depression A downward trend in business conditions was felt however, during the last two months of 1937, following upon the business recession in the United States, and continued into 1938, affecting all branches of industry The general recession reached its lowest point in July 1938, and from then on business activity showed a slow upturn, although in practically all fields, at the end of 1938 it was still below the level of 1937 A survey of business activity for Oct 1938 indicated a 3 per cent rise, the best in any month since August, shared by practically all branches of industry The European war crisis of September caused a cessation in this upward trend, but improvement continued after conditions became more settled

Production of newsprint showed a gain for October at 254,872 tons as compared with 231,940 tons for September This was still below the figures for Oct 1937 of 315,477 tons, and a comparison of the months from January to September shows a decline from 2,528,468 for 1937 to 1,719,318 for 1938 For the twelve months ending Sept 1938, construction contracts awarded amounted to $189,121,500 as compared with $213,323,300 for the previous year, the month of Sept 1938 being placed at $19,535,000 as against $21,715,000 for Sept. 1937 The export of pulpwood showed a decline from 1,884,342 cwt in Oct 1937 to 1,001,883 in Oct. 1938 Motor manufacturing plants operated at a low scale of production for 1938, but for September showed an increase of 6,089 units, as against 4,417 units for Sept 1937 The primary iron and steel industries at the end of 1938 were still operating at a lower level than in 1937, although the index of the industry as a whole rose from 73·6 in August to 89·1 in September, while in 1937 it declined from 111·3 to 89·1 between these months (1926 = 100). The production of pig-iron from Jan. to Sept. 1938 declined from 654,438 tons during that period in 1937 to 554,845 tons

Wheat One of the salient features of improvement is in the increased grain crops for 1938. The western wheat crop is of good quality and officially estimated at 334,000,000 bushels (1937, 181,000,000; 1936, 212,000,000). Each of the prairie provinces has an increase on last year's crop: Manitoba, from 48,000,000 to 50,000,000; Saskatchewan, from 37,000,000 to 143,000,000, Alberta, from 74,000,000 to 141,000,000. This increased yield, combined with a price of 80 cents a bushel guaranteed by the Canadian government for No. 1 Hard delivered at the head of the lakes, led to the heaviest grain movement for years during September and October, increased business activity throughout the country, and will result in a higher rural purchasing power, more than $25 millions over 1937, with better distribution than in 1937. Carloadings of grain from Sept. 1 to Oct. 15 were 80 per cent greater than for the same period in 1937, and wheat export in bushels rose from 55,000,000 for the seven months ending Sept. 1937 to 63,000,000 during the same months in 1938. Although the cost to the Dominion government for the wheat purchased, over the market value, will be some $50 millions, this will be made up for somewhat by a reduction in relief expenditure.

Crop conditions in other parts of the Dominion were

satisfactory, except in British Columbia, where there was a severe drought

Mining The mineral production for the first six months of 1938 was valued at $209,654,610, compared with $215,382,814 for the first six months of 1937, or only a 3 per cent decline, which was a good record because of the heavy deflation in non-ferrous base metal prices Gold production showed a consistent rise, over 2,200,000 oz. being produced, 12 per cent more than in 1937 Reduction in the price of base metals led to a decline in the market value of the year's production of copper, lead, and zinc, but the volume yield was ahead of 1937

The following table is taken from the *Monthly Commercial Letter* of the Bank of Commerce for November These are the latest available figures for 1938, but the estimates for the remaining months of the year show very much the same picture The development of the Turner valley oil mines in Alberta, with a capacity of 50,000 barrels a day, is a stimulus to that industry

Canadian Mineral Production

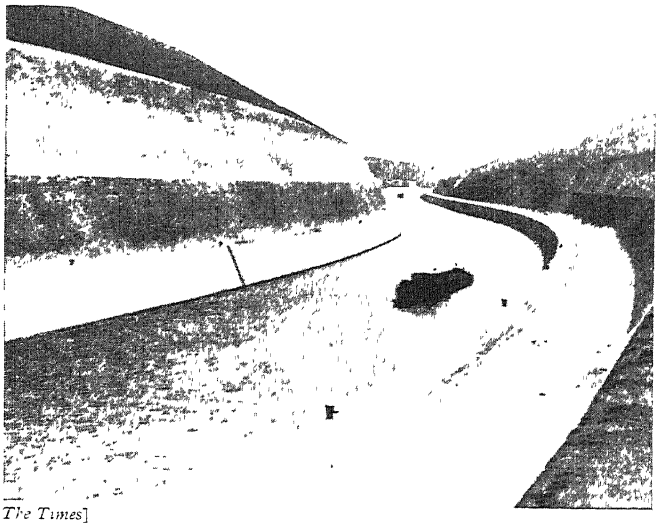
Employment. The index of employment for the year was also an encouraging feature For the first few months it suffered a falling off from 1937, until April, when an increase was shown. This continued, until by Nov. 1938 the figures in the employment bulletin reached within 8 per cent of the recovery peak of Sept. 1937. The monthly reports for August and September showed a gain of employment exceeding that of the same months in any year from 1921 to 1937.



The year was relatively exempt from strikes and labour troubles, the most striking feature in this respect being the occupation of the Art Gallery, Post Office, and other public buildings of Vancouver for a month (July) as a form of demonstration by the unemployed. (S. LEA)

CANADIAN LITERATURE. Without spectacular literary events, 1938 brought gratifying consolidation of recent tendencies towards more pronounced maturity of viewpoint in Canadian books Canada is too young, too close to the dictatorship of the cross-roads church, for a realistic approach to her seamier side. But in a conservative manner a number of young writers are developing into deserved prominence for their serious approach to problems of normal Canadian life Miss Mazo de la Roche, Canada's leading novelist, by publishing *Growth of a Man* proved that she can write brilliant novels without benefit of *Jalna* No outstanding volume of poetry appeared during 1938. Non-fiction was impressive. In the spring three first-class books appeared within a single month. G. M. Wrong climaxed a distinguished career of historical research with his vigorous short history, *The Canadians* R. C. Fetherstonaugh's *The Royal Canadian Mounted Police* is a triumphant synthesis of facts, figures, and drama *Postscript to Adventure*, the posthumously published autobiography of "Ralph Connor" (Rev. C W. Gordon), is the best volume he ever wrote Autumn brought three other significant books—Beverley Baxter's *Westminster Watchtower*, one of the few important commentaries on Imperial affairs by a Canadian, *Robert Laird Borden: His Memoirs*, the impressive documentation of the career of Canada's war-time premier, and J. M Gibbon's *Canadian Mosaic*, a magnificently illustrated account of Canada's racial components. The promising Association of Canadian Bookmen with its effective Book Fairs over-extended itself into temporary eclipse, but *The Canadian Poetry Magazine* continues and the old *Canadian Bookman* has been brilliantly rejuvenated The governor-general's literary awards for 1937 went to Mrs L. G. Salverson's *The Dark Weaver* (fiction), E J Pratt's *The Fable of the Goats* (poetry), and Stephen Leacock's *My Discovery of the West* (general literature) (R S. K.)

CANALS AND INLAND WATERWAYS. In Great Britain, there were no developments in canal construction during 1938, but under the administration of the recently formed Catchment Boards, an increasing degree of activity has prevailed in improving the existing channels of certain rivers, so as to render them less subject to flooding and more serviceable for navigation. As an example may be taken the case of the River Nene. On the 62 miles of river between Peterborough and Northampton, a total of 28 locks have been reconstructed, in sequence with nine which were completed in 1937. The dimensions of the former locks were 101 ft. in length by eleven ft. in width, with three ft. six in. of water over the sills. The new locks are constructed to conform to the standard of craft on the Grand Union Canal, *viz* 83 ft. 6 in. in length by fifteen ft in width, with six ft. of water over the sills. These new locks will accommodate a standard barge of a hundred tons carrying capacity, or two narrow barges abreast, without waste of water, which is an important consideration during periods of drought. Vertical gates have been installed at the lower ends of the locks, so that, if necessary, the locks may be used as sluice-ways in times of flood. The locks, in fact, have been designed for the dual purposes of navigation and land drainage. In addition to constructional work, a good deal of dredging has been done to improve and deepen the river-bed, so as to render it more effective as a navigable channel. River embankment works have been in progress on the Great Ouse and the Humber, in which cases considerable use has been made of the system of fascine mattresses, practised so largely in Holland

France. In France also, no new internal waterway has been under construction, though a project has been revived for the completion of the Canal du Nord, which has been derelict since the Great War, but the government have not seen fit to adopt the scheme Apart from the completion at Lyons of a basin for *hydrocarbures*, with an adjacent small basin for general purposes, the only works carried out during the year have been the strengthening of existing embankments by means of steel sheet piling, or concrete slabs, rendered necessary, and even urgently so, by reason of deteriorations caused by motor-propelled craft, the number of which is increasing.

Belgium. The great national work, the Albert Canal, has made good progress during the year, and preparations are being made to signalize its completion in 1939 by the holding

The Times]
ONE OF THE SECTIONS OF THE ALBERT CANAL ALREADY IN USE
THAT AT VROENHOVEN

of an international exhibition at Liège, dealing with the subject of water in all its phases The Albert Canal, comparable in importance with the Twente and Juliana Canals in Holland, opened in recent years, and the Mittel-land Canal in Germany, referred to below, is 79 miles long, connecting the city of Liège with the seaport of Antwerp, and on completion its construction will have cost about £13½ millions It will reduce the sailing time between Liège and Antwerp to two and a half days, compared with sixteen days in 1929 by the old 95-mile canal route, and five days at the present time The cross-section of the new canal is based on the standard Rhine barge of 1,350 tons, *i e* 262 ft. long by 29 ft beam, with 8·2 ft. loaded draught The canal width is 180 ft and the depth 16 ft. 6 in. There are five locks giving a fall, or lift, of 32·8 ft. each, and one giving 19·7 ft A notable and regrettable incident during the year was the collapse of the Hasselt road bridge, over the Canal, which took place on the morning of March 14. The bridge was 245 ft. span, and had been in service about fourteen months when, without preliminary warning, it suddenly gave way. Fortunately, there was no loss of life. It was a steel bridge of the Vierendeel type, all welded, and weighed 646 tons

Germany. On Oct. 30, the official ceremony was held at Magdeburg, in which Reichsminister Hess opened the final section of a great inland waterway known as the Mittel-land (Midland) Canal. It marks the culmination of a scheme of internal navigation connecting the natural waterways of the Oder, the Elbe, the Weser, and the Rhine, placing Berlin, in the east of Germany, in direct communication by water with the western industrial region of Westphalia. It is now possible for craft up to 1,000 tons in carrying capacity to reach Berlin from the North Sea, and equally, there is a serviceable route from the capital to the south-west as far as Basle on the borders of Switzerland, or eastwards into Silesia as far as Breslau, or again via the Oder to the Baltic.

The great ramification of which the Midland Canal forms the last (though an intermediate) link had been contemplated as far back as the sixteenth century, but it is only within the last fifty years that it has taken definite shape. Altogether, the system aggregates almost 7,000 miles of navigable waterways. The Midland Canal itself is just under 300 miles long. Starting from Magdeburg, it passes through Brunswick, Hanover, and Minden to a junction with the Dortmund Ems Canal; thence through Munster to its termination at the junction with the Rhine. Among notable engineering features are the twin locks at Anderten, near Hanover, with a rise or fall of fifty feet, and the mechanical lift at Rothensee (Magdeburg) with a range of sixty feet Another main arterial waterway, the Rhine–Main–Danube Canal, linking the three rivers in question, is also under construction, and the section of the Main is canalized nearly as far as Wurzburg. The Neckar is canalized as far as Heilbron, and an extension towards Stuttgart, designed for the passage of 1,200-ton barges, is commenced Other works in hand include the Masurian Canal in East Prussia, and the regulation of the Rhine between Strasbourg and Basle

Russia. The completion of the White Sea–Baltic and the Moscow–Volga Canals is now to be followed up by the construction of the Volga–Don Canal, the scheme for which has recently been revised Under the new project, the river Don is to be dammed at the village of Kumovsky so as to create a reservoir, with a capacity of 56 milliard cubic metres of water, running along the valley of the river Karpovka, and rendering it possible to cut through the watershed with a comparatively short length (forty kms.) of canal. The maximum depth of the cutting will be 37½ metres The total length of deep waterway created by the Volga–Don Canal from Stalingrad to Rostov and up to the Don Reservoir will be 1,250 kms., or, if the river Donietz is included, 1,500 kms The width of the canal will be between 100 and 190 metres, and the depth from eight to twenty metres The reservoir water will be utilized for hydro-electric development. (B. Cu.)

United States. During 1938, the work of improvement was practically completed on several large projects, including enlargement of the Chesapeake and Delaware canal to a depth of 27 ft. below mean sea-level and minimum width of 250 ft , canalization of the Kanawha River to provide a minimum channel depth of nine ft. ; the Tygart dam for flood control and augmentation of low-water flow in the Monongahela River navigation pools ; the Bonneville dam for production of power and for navigation in the Columbia River.

Work has been vigorously prosecuted on many other projects, and several of the large and important ones were nearing completion at the end of the year, including the canalization of the Mississippi River to provide a navigable depth of nine ft. between Minneapolis, Minn , and the mouth of the Missouri River ; improvement of the Illinois waterway to ensure a dependable channel nine ft. in depth for navigation throughout its length of 327 miles from the Mississippi River to Lake Michigan at Chicago , construction of the Fort Peck dam and reservoir on the Missouri River in Montana for regulation of the low-water flows. Construction of bank revetment and permeable dykes for stabilization and fixation of the channel in the Missouri River to secure a channel suitable for six ft. navigation to Sioux City, 761 miles above the mouth, has been actively in progress during the year, the project being substantially completed up to St. Joseph, Montana.

CANARY ISLANDS. A group of thirteen islands (seven inhabited) off the African coast, administered as two provinces of Spain—Las Palmas and Santa Cruz de Tenerife. The chief islands are Gran Canaria and Tenerife.

Area and Population :
Total Area 2,807 sq. miles.
Population (est. Dec. 31, 1934) 599,712.
Chief Towns : Las Palmas (83,500), Santa Cruz (66,500).
Language. Spanish (Castilian).
Religion. Roman Catholic.

CANCER. There is a popular belief that Eskimos never have cancer, but investigation of hospital records in Greenland revealed that they have about the same proportion and same kinds of cancer that any other race has. The fact that Switzerland has one of the highest cancer rates in Europe was used by one eminent professor to support the theory that cancer was caused by cosmic rays. The truth is that the Swiss have a high percentage of autopsies and the country is so small that a highly trained medical profession is able to see and diagnose most of the cancer cases.

With the increased interest in the disease, extension of hospitalization, better education of physicians, and the increasing number of autopsies, the cancer rate has risen in the United States. With the increase of the older age groups in the population of most countries, the cancer rate will rise to a maximum based upon the permanent age distribution equilibrium.

Recent studies made in Java showed that cancer in general was about as prevalent among labourers there as in the European countries, if care was taken to compare the same age groups. Remarkable differences, however, were noticed in the distribution of the tumours in various organs of the body. The most striking phenomenon is the high frequency of cancer of the liver in both the Chinese and Javanese. This type of cancer nearly always develops in a liver which is the subject of a chronic process known as cirrhosis. The same peculiar distribution has been noted in the Javanese and Hindus in Surinam. There is a striking difference between the Chinese and Javanese in Java as regards the frequency of cancer of the stomach. The Chinese have about the same rate as the European races living in Java, yet cancer of the stomach is practically not seen in the Javanese. Singularly enough, the Chinese in Singapore also show a high death rate from cancer of the liver, while the Japanese have a relatively low rate and the Filipinos, again, have a high death rate from cancer of this organ. Careful studies are being carried on to see whether dietary or other habits of the different races may in any way account for these differences.

Research. The investigation of the group of synthetic chemicals, interesting because of their powerful physiological properties, has been continued by Cook, Fieser, Dodds, and their collaborators. Extensive studies are being carried on to determine whether different strains of mice and rats have varying susceptibilities to the different types of such carcinogenic substances. The method of administration of the chemicals unquestionably has some influence on the time of appearance of the tumours. Studies on pure strains seem to indicate that moderate variations may exist in the time of induction of the tumours. There is no question that such differences exist between mice, rats, and guinea pigs. The time for the appearance of tumours seems to run roughly parallel with the length of life of the animal.

The various groups and related compounds of the three most highly carcinogenic agents are being studied, but up to now, because of the nature of these chemicals and the difficulty of obtaining highly purified substances, only a limited amount of work has been done. The relationship between the structure and number of attached radicals, and variations in the position of these radicals, are under investigation in many laboratories, and in a short time the structure correlated with high carcinogenic properties will be known.

A far different problem will be the determination of the method of action of the carcinogenic hydrocarbons. The time of appearance of the tumours in the animals seems definitely to be correlated not so much with the quantity of the chemical as with the area exposed to irritation. This has been shown particularly well in the work of Bullock, Curtis, and Dunning, who injected under the skin of mice and rats small paraffin globules containing varying quantities of carcinogenic substances and found that with a sufficient number of globules, even though each contain a minute quantity of the agent, a high percentage of tumours is obtainable. Apparently one hydrocarbon can supplement the other and carry to completion the biological changes in the cells which give them the peculiarity we designate as malignancy. Unfortunately, a study of the microscopic changes in the tissues of these experimental animals which ultimately lead to some sort of change or mutation in the nature of the cell is of little or no value.

Treatment. Work on the study of the damaging capacities of neutrons on various types of tissue, and the beginning of experimentation upon human beings suffering from cancer, has been carried on at the University of California under the auspices of Professor E. O. Lawrence, from whose tests it would seem that neutrons are somewhat more effective than X-rays in killing cancer cells, but this result has not been confirmed as yet from other laboratories.

For the radiotherapeutic treatment of cancer, *see* RADIOLOGY (*See* also BACTERIOLOGY, GYNÆCOLOGY AND OBSTETRICS.)

(F. C. W.)

CANNING INDUSTRY. Further research was devoted in 1938 to improvement of quality in canned foods. The "Tenderometer", which was used experimentally in 1937 as a means to determine mechanically the tenderness of raw peas used for canning, was extensively applied in actual practice in 1938. Mechanical refinements were made and probable use for products other than peas was indicated. Increased information on the processing of non-acid products was also obtained and bacteriological field studies led to further knowledge of causes of spoilage. Development occurred in new types of processing equipment, and improved processing procedure was regarded as a marked advance in the science of processing (sterilizing) canned foods. There was a further increase in the use of cold-reduced tinplate used for canned foods and a marked increase in the installation of cold-reduction mill equipment.

In Great Britain, fresh activity was shown in expanding the industry. At the government-sponsored enterprise started in Oct. 1936 in the Tearn Valley, 85 firms were in production at the end of 1938, and factory employment was increasing. Factories for canning game birds and venison have also started. Imports of canned goods from Canada and Australia increased during the year.

During 1938, the canning industry of the United States used over 10,000 million tin containers for packing food. The pack of fruits, vegetables, and specialties totalled about 235 million cases, or the equivalent of 6,700 million cans.

Malayan Information Agency]
CUTTING SHED OF THE SIN HENG PINEAPPLE FACTORY IN MALAYA, THE SECOND LARGEST PINEAPPLE-EXPORTING COUNTRY

Fruit and vegetable juices, which are relatively new products, accounted for about 35 million cases, or the equivalent of about 1,000 million cans. Next to fruits and vegetables, milk was the largest item canned About 2,500 million tin containers were used for milk Fish and meat accounted for the remainder of about 1,350 million cans.

An interesting feature has been the development of the beer can. Technological difficulties confronting this achievement were twofold (*a*) to pioneer a design and construction that would withstand the high pressure of pasteurization, and (*b*) to prepare a lacquer which would insulate the beer from the metal of the container. These problems called for unique treatment, but they were solved. The consumption of tinplate for beer cans in 1938 has not yet been estimated, but it was in excess of that for 1937, for estimated consumption of 1½ million base boxes of tinplate (approximately 700 million cans).

ČAPEK, KAREL MATĚJ, Czech dramatist and novelist, was born at Malé Svatonovice, Bohemia, on Jan. 9, 1890, and died in Prague on Dec 25, 1938. A brief account of his work may be found in the *Ency. Brit*, vol. 4, p. 787. His more recent publications included the novels: *Hordubal*, 1934; *Meteor*, 1935; *An Ordinary Life*, 1936; *War with the Newts*, 1937; the plays: *Power and Glory*, 1937; *The Mother*, 1938, and a number of minor works such as *The Gardener's Year*, 1928; *President Masaryk Tells his Story*, 1929 and 1930 (London edition 1934); *Letters from Spain*, 1932, and *Letters from Holland*, 1933.

CAPE OF GOOD HOPE. The provincial council, consisting of the same number of members as are elected from the province to the House of Assembly, sits at Capetown: an executive committee elected by the council administers revenues and may issue ordinances for specified provincial matters subject to approval by parliament. The Cape alone among the provinces has, by an Act of 1856, divisional councils for the purpose of local government.

In the native areas general councils of the natives under European guidance provide organs of local self-government with wide powers. The general council of the Transkei is responsible for an annual expenditure of some £200,000, and has established schools and experimental farms. The Representation of Natives Act of 1936 modifies the franchise previously enjoyed by the native and coloured people and provides for separate election by the Cape native

Education (European) June 2, 1936: Scholars: Primary classes, 124,244; Secondary, 23,853.

CAPETOWN, the second largest city in the Union of South Africa, is the seat of the legislature. The University occupies fine modern buildings, and there are Anglican and Roman Catholic Cathedrals. In May 1938 General Hertzog inaugurated important additions to the harbour. The scheme, which is to cost £6 millions, is necessitated by the large increase in trade; in 1910 the cargo handled amounted to 950,000 tons, and in 1937 it was over 2,000,000 tons. A new basin is under construction, and the material dredged from the sea will be used to reclaim 360 acres of land, much of which will be used for building. The South African railways have begun the construction of new quays in connexion with the scheme. The construction of a graving dock is contemplated in the future. The fine climate and the beautiful scenery of the environs have made Capetown an important centre for holiday-makers. (J. L. K.)

CAPE VERDE ISLANDS. An archipelago of ten islands and five islets off the west coast of Africa, constituting a colony of Portugal. The islands are divided

into two main groups, Barlavento and Sotavento. São Vicente in the Barlavento group is the chief coaling station on the South American route.

Area and Population :
Area 1,538 sq. miles.
Population (est Dec 31, 1936) 163,000
Chief Towns · Praia (capital), São Vicente.

Governor: Major A G de Figueiredo.

Production 1937 (metric tons): Maize, 148, Preserved Fish, 325, Coffee, 67, Salt, 29,843, Dry Fish, 123, Oranges, 13.

Roads. 306 miles

Finance 1939. Revenue and Expenditure 19,452,001 escudos.

Education 1937. 155 elementary schools, 1 secondary

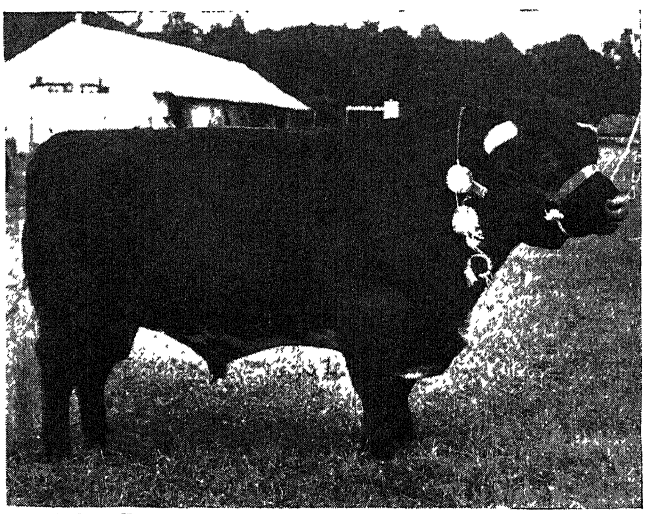
CAPITAL PUNISHMENT. Marked changes are coming about in Europe in regard to capital punishment Great Britain is leaning toward the abolition of the death penalty On the Continent, States long foes of the death penalty are restoring it.

A popular poll in 1938 gave 45 per cent of British opinion favouring the abolition of the death penalty, and on Nov 16, 1938, the House of Commons passed, by a vote of 114 to 89, a resolution by Mr Vyvyan Adams, favouring its abolition experimentally for a period of five years While the government took a neutral position, it declared that any experimental change in the law should extend beyond the five-year period.

In the United States also there has been a constant effort to change or modify capital penalties. New York joined the large majority of the States at the end of 1937 by granting the jury the right to grant mercy in capital cases. Only six States retain mandatory capital punishment for first-degree murder, these being Massachusetts, Vermont, Connecticut, North Carolina, Florida, and New Mexico Seven States retain the abolition of the death penalty: Maine, Rhode Island, Michigan, North and South Dakota, Minnesota, and Wisconsin. Kansas restored it in 1935 after a period of 28 years Eleven States still hang criminals; 21 States use electrocution; eight States have substituted lethal gas. Utah gives the condemned the choice of hanging or shooting. The following Latin American countries have ended capital punishment: Argentina, Brazil, Ecuador, Peru, Venezuela, Uruguay, Colombia, Costa Rica, Honduras, Panama, San Domingo, and a large part of Mexico

CAPITULATIONS. During 1938 the Montreux Convention, abolishing the Capitulations and setting up a transition period of twelve years for the mixed tribunals, came into full operation Those tribunals took over the entire criminal and civil jurisdiction hitherto enjoyed by the consular courts and their new assize courts worked throughout the year. The judicial reorganization necessitated by this transfer of jurisdiction was approved But up to the end of the year the Egyptian government had not carried out its intention of modifying, as a natural consequence of the abolition of the Capitulations, the prison regime for persons convicted by the mixed tribunals, and foreigners thus dealt with continued to obtain the privileged form of treatment applied to them hitherto.

Most of the Powers availed themselves of the right accorded by the Montreux Convention to opt to retain consular jurisdiction in matter of personal status concerning their own nationals. Within the Empire the only Dominions who did not do so were Eire and South Africa. In addition to personal status matters of British subjects, the British consular courts continue to handle, under the special clauses of the Montreux Convention referring to the British forces, criminal cases against members of those forces and their families, and civil cases against those members for actions in their official capacity In April Mr E W Besly, barrister-at-law, was appointed judge of the British consular court in Egypt, in addition to his duties as legal adviser to the British embassy. (A MN)



CARAVANNING: *see* CAMPING, CANOEING, AND CARAVANNING

CARDOZO, BENJAMIN NATHAN, Justice of the United States Supreme Court, was born in New York City, of Jewish parentage, in May 1870, and died on July 9, 1938 Called to the Bar in 1891, he immediately set up practice in New York and lived the simple and quiet life of a lawyer till he was elected to the Supreme Court of New York state in 1914, later joining its Court of Appeals In 1932 he was appointed to the United States Supreme Court by President Hoover Cardozo brought a rare mind to his new post, for he had thought and written much about the law, being interested not so much in its precedents and rules as in its philosophy and the reasons for its application. Liberal in outlook, but modest and retiring in disposition, he became known to the entire United States in the earlier part of Mr. Roosevelt's Presidency, when measure after measure involved in the New Deal was challenged for its constitutionality before the court Cardozo invariably took the side of the President, and the judgments pronounced in favour of the New Deal were usually written by him. At first when such cases came up he found himself in a minority of "liberal judges", but since 1937 the minority has become a majority He was unmarried.

CATTLE AND SHEEP. Although the best British cattle are of excellent quality it is now generally recognized that there is urgent need to improve the quality of the *average* herd, and recently numerous measures have been initiated to achieve this result. Of latter years there has unfortunately been no increase in the numbers of "premium" bulls, *i.e.* service animals qualifying for subsidy by reaching a certain standard, between 1934 and 1937 the number licensed each year fluctuated around 1,460, which represents less than 10 per cent of the service bulls in use

Sport & General]
CARDIFF AGRICULTURAL SHOW: MR J. V. RANK'S CHAMPION SHORTHORN BULL "BAPTON AERIAL"

In 1938 the grants for premium bulls were augmented, the State now paying half the purchase price up to a maximum of £40 as well as additional sums if the bull is kept two years or longer. The cattle subsidy also stimulates the production of better quality beef, those animals which reach the "quality" grade obtaining 2*s.* 6*d.* more per (live) cwt. During the first year of operation of the new subsidy scheme (Aug. 1937 to July 1938) the proportion of animals attaining the quality grade was in Scotland 83·4 per cent, in England 47·6 per cent, in Wales 24·5 per cent and in Northern Ireland 13·1 per cent. (*See* also AGRICULTURE.)

On the European continent the year was marked by appalling ravages of foot and mouth disease. This particular epidemic was brought to France in a consignment of sheep from Morocco in March 1937 and quickly spread to adjoining countries, but the ravages of 1938 were more serious than in the previous year, particularly in Germany. Though full statistics are not yet available, it is estimated that in France, Belgium, and Germany about half the cattle became infected; mortality was not exceptionally heavy, but farmers suffered a loss both of milk production and of beef quality running into several million pounds. In Great Britain the slaughter policy was strictly enforced and the outbreak kept within relatively small dimensions. Over 50,000 animals were killed and some £250,000 was paid by the State in compensation. Denmark also follows the slaughtering policy; up till the early summer of 1938 only 100 farms had been infected but in July and August the disease spread farther. Switzerland applies a modified slaughter policy which also kept the outbreak down.

Sheep. There are about ten million ewes in Great Britain; these have rather more than ten million lambs, but a certain number of these latter will be killed off before June 4, when the returns are taken. By June 4, therefore, there are about ten million lambs; the remainder of the "other sheep"—about three to four million—being rams (about 200,000) and one-year-olds, with a few old wethers. Probably, therefore, about 2½ million lambs survive their first year of existence on the road to mutton. Another 2½ million are required for replacement of the foundation flock of ewes, for the average life of a ewe is about four or five years. Of, say, eleven million lambs born in a year, therefore, about six million are slaughtered as lamb, about 2½ million go into the breeding flock, to find their way eventually on to the market as old ewe mutton, and about 2½ million pass on to the next year to be slaughtered as mutton. Sheep numbers in Great Britain rose in 1938 to 25,537,000, nearly regaining the post-war maximum of 26,411,842 in 1932. The wool clip was somewhat larger than in 1937, when it totalled 77 million lb.

In South Africa the drought at the end of 1937 caused the 1937–38 clip to be twelve per cent lower than in the previous year and also affected the quality adversely, so that wool exports fell from £13·8 million to £8·8 million. However, good rains fell in early spring and a good wool clip is anticipated for 1938–39. Some sheep farmers despairing of wool at 9½*d.* per lb. have been changing over to slaughter-sheep. While the market for mutton appears none too promising, there may be a development of fat lamb exports in the near future as a result of successful experimental consignments to Smithfield.

(For sheep and wool in Australia and New Zealand *see* AGRICULTURE.) (P. L. Y.)

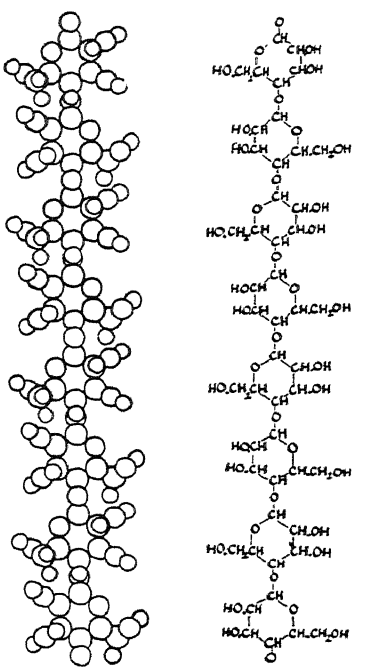
CAYMAN ISLANDS: *see* JAMAICA.



CECIL OF CHELWOOD, EDGAR ALGERNON ROBERT CECIL, 1st Viscount (1864–), British statesman, chancellor of Birmingham University since 1918, and president of the League of Nations Union since 1919. A biographical notice will be found in the *Ency. Brit.*, vol. 5, p. 85. Lord Cecil is an ardent upholder of the ideal of the League of Nations, of collective security, and of the principles of international limitation of arms, his consistent advocacy of which, together with his organization of the Peace Ballot (1934), led to his being awarded the Nobel Peace Prize in Nov. 1937. Housing is another of his interests, and from 1923 to 1936 he was president of the National Association of Building Societies.

Lord Cecil, who is famous as a speaker, gave the Romanes lecture ("Peace and Pacificism") at Oxford in May, and on June 2, on the occasion of the bestowal of the Nobel Prize, spoke on peace at Oslo. In June 1938 he severed his connexion with the Conservative party on account of the government's policy in regard to the bombing of British ships by Spanish insurgents; he expressed strong objection to the prime minister's refusal to take any action, economic or military, to protect British lives or property, and said that he could not any longer allow himself to be treated as even nominally a supporter of the government.

Viscount Cecil married (1889) the third daughter of the second Earl of Durham; there is no heir to the title.

CELLULOSE AND CELLULOSE PRODUCTS. During the past decade modern methods of X-ray analysis have enabled the problem of the chemical constitution of cellulose, so long outstanding, finally to be solved in all essential particulars. Cellulose as, now, thus visualized is made up of chains of glucose residues, linked like strings of pearls, in variable numbers per string (200 or even more); each glucose residue consists of six atoms linked to form a ring of five carbon plus one oxygen atoms with subsidiary other atoms or groups of atoms, appended to each such glucose residue ring; then, further, between glucose residue and glucose residue in the chain, between pearl and pearl as it were, is an oxygen atom as intrusive extending link, of smaller dimensions. A bundle of such chains, of large and variable number (fifty or more), then aggregated together, by forces of adhesion, forms what is called a micelle or crystallite, these, in turn, aggregate in more or less ordered array, something like brickwork, to give yet higher aggregations, forming fibrils, fibres, filaments, in the characteristic forms of cellulose, known to laymen. This is the sense in which cellulose is now considered to be crystalline, the micelles or crystallites being the units of crystalline structure which account for optical properties, refraction, etc., of cellulose, just as similar orderliness

among their atoms accounts for optical effects in known crystals In growing plants many substances accompany cellulose, *e g* lignin, pectins, waxes, fats, tannins, sugars, starches, some of which are present in solution in sap and others as interstitial incrustants, not in chemical combinations with the cellulose , the industrial processes for preparing purified celluloses, for use in textiles, paper, etc., are merely various methods of removing these substances with, simultaneously, minimum attack on and damage to the intrinsic merits of the cellulose proper.

This recent clarification of our knowledge of cellulose and its relationships to other substances which accompany it in the living plant has, further, in turn, led to some revision of earlier ideas about the chemical reactions of cellulose. Thus, X-ray analysis has shown that the ester and ether derivatives of cellulose are tri-esters and tri-ethers only; what were previously considered to be the mono- and di-substitution compounds are, in reality, no more than partially esterified and etherified products, since they lack the stoichemical homogeneity that is, of course, an essential of a specific compound, in the sense that, in them, some of the glucose residues of the cellulose chains remain as unesterified or unetherified unchanged survivors That is, scientifically, a great simplification of knowledge which has already led to some important industrial modifications and extensions of earlier procedure

In cellulose dispersions, often called solutions, *e.g.* in viscose, in dopes and lacquers, the cellulose ester compound present is now visualized as consisting predominantly of chains separated from one another, each greatly swollen with an envelope of the solvent, just as gelatine swells in water, so that the dimensions of the chain are thereby much augmented, and there is, simultaneously, by just so much, the less free solvent in which the swollen chains are sustained afloat by the usual kinetic molecular forces characteristic of true solutions. High viscosity is thus intelligibly characteristic of these dispersions , and coagulation, to form rayon filaments and "Cellophane" film, for example, or the lacquered surface on a motor-car, is the reassembly of the chains to form micelles or crystallites and, in turn, the higher aggregates, above described, of the regenerated final product, in the form desired.

Technologically, it is a striking fact that the industrialism of cellulose remains to-day what it has been for many decades, in the sense that, whereas there have continued to be great advances in methods of processing, in detail, those methods are, in practice, applied only to a few species of raw materials, and only a very few of the known chemical reactions of cellulose are employed; industrial advances, intense and of most impressive dimensions as they are, are thus on a very narrow frontage, which is as narrow to-day as it was decades ago Thus, cotton, flax, jute, hemp, etc., are used in the textile industries, perhaps a dozen species in all; for paper, wood and esparto are as dominant as ever; and there are no new-comers of any real importance as yet. Then, again, of the legions of esters and ethers of cellulose known, only the three esters, in use decades ago, namely, nitro-cellulose, the xanthogenate (viscose), and the acetate, are in use to-day in anything like large quantity. The really important advances have all been in improvements of technology, solely, which is very remarkable.

In the pulp and paper industries, modifications of process detail have developed ever-increasing gentleness of treatment for the removal of non-cellulose accompanying substances, so that the intrinsic merits of the cellulose proper are conserved The digestion processes employed have been modified, methods of better penetration and circulation devised so that lower temperatures and shorter times suffice, and bleaching, now carefully controlled so as to avoid the evils of excessive and uneven bleaching, have all played their part in improving quality and yield Straw, always in use for some grades of cheap products and much used for strawboards, is now becoming important, even for good-class white papers, in those countries, having much of it, that now develop their own industrialism, generally behind tariff and freight protection Especially successful in this modern utilization of straw is the Pomilio process, which employs chlorine by the industrialization of the Cross and Bevan assay method, in universal use as a laboratory method since 1880 , in South America and Italy much good-quality paper is thus made, and factories employing the method are being constructed in South Africa and projected in Australia and elsewhere, not only for the use of straw, but for other grasses (*e.g.* kuru-kuri) and wood.

Nitro-cellulose is produced in ever-increasing quantities for explosives, celluloid, lacquers, and so on, as before; but with modifications and improvements that derive from the enormous increase in plasticizers, solvents, pigments, etc , appearing day by day in bewildering number The xanthogenate (viscose) is still dominant in the production of rayon and thin transparent tissue wrapping and it will remain dominant because of the cheapness of the raw materials and the use of water as the dispersion fluid, which are overwhelming advantages not easily to be surpassed Nevertheless, cellulose acetate rayon has also its own intrinsic merit and beauty which have ensured its increasing success , as a plastic material its safety, by comparison with the nitro-cellulose, has ensured the use of acetate for the cinema film used by amateurs and for A R P gas masks, as additions to earlier uses for which it is especially successful, *e.g.* extrusion moulding, of tubes (fountain-pen barrels). Its favourable thermo-plastic properties are also bringing it into increasing use in substitution, in the laundry, for starch as stiffening interlayer in what are known as semi-stiff collars, now much worn by men For this purpose, a three-ply product is made up by employing cellulose acetate as centre-ply with a special dope as adhesive, so that the whole stiffens up when ironed in the laundry, without starching. Thus are made attached or detachable semi-stiff collars with poplin, rayon, wool, or other surface-ply coverings.

CELTIC STUDIES. The *Revue Celtique*, founded in 1870, ceased publication with the 51st volume in 1934 A new journal, *Études Celtiques*, directed and published by Professor Vendryes, began to appear in 1936, and aims at preserving the chief features of its predecessor, notably the very useful bibliographical notices. An abridgment and adaptation of Pedersen's *Vergleichende Grammatik d. kelt Sprachen*, by Henry Lewis and H. Pedersen, was published in 1937 by Vandenhoek and Ruprecht under the title *A Concise Comparative Grammar of the Celtic Languages*. The new book, written in English, contains much new matter bearing on the British languages.

Gaelic Languages. The most important publication under this heading is the photographic facsimile of the Milan *Commentary on the Psalms with Glosses in Old Irish*, edited

for the Royal Irish Academy by R. I Best, with a valuable Introduction (1936). The Irish MSS. Commission published in 1938, under the editorship of Dr Gwynn a facsimile of *The Patrician Documents in the Book of Armagh*. *Hessens Irisches Lexicon*, "a concise dictionary of Early Irish with definitions in German and English" (Niemeyer, Halle, reached in 1938 the second fascicule of the second volume, (luchait—2 ochtach) A welcome modification of the original plan of the work is the increasing number of references and quotations Among editions of literary texts may be mentioned E Knott's of *Togail Bruidne Da Derga* (1936), and K Jackson's of *Cath Maighe Léna* (1938), both published by the Stationery Office, Dublin; *Scottish Verse from the Book of the Dean of Lismore*, edited by W J Watson (Oliver & Boyd, 1937), *Poems from the Book of the Dean of Lismore*, a transcript of the unpublished poems in the MS prepared by the late E C Quiggin (Cambridge University Press, 1937) The investigation of early Irish law by Thurneysen and his pupils is continued in *Studies in Early Irish Law* (Hodges, Figgis & Co., 1936). J Cameron's *Celtic Law* (William Hodge & Co., 1937) deals also with an early legal system in Scotland

Welsh Language. Professor Lloyd-Jones's great lexical work, *Geirfa Barddonaeth Gynnar Gymraeg* (Cardiff, Welsh University Press), progresses steadily, and has reached *dofre* Professor Ivor Williams's editions of early texts now include *Cywyddau Iolo Goch ag Eraill*, 2nd ed (1937), and *Cano Aneirin* (1938), both published by the Welsh University Press. An elaborate treatment of Welsh names is begun in R. J. Thomas's *Enwau Afonydd a Nentydd Cymru I* (Welsh University Press, 1938) (J. F.)

CENTRAL INDIA. This is the name given to a group of States, of which Bhopal, Indore, and Rewa are the chief, adjoining the Central Provinces, and under the supervision of an agent (Mr K. S. Fitze) to the Governor-General, with his headquarters at Indore. The total area is over 53,000 square miles, and the population 6,655,158

CENTRAL PROVINCES AND BERAR. The new status of this Indian province was emphasized by the terms announcing the appointment, in May 1938, of the present Governor, Sir Francis V. Wylie, "after consultation with H E H. the Nizam of Hyderabad and Berar". His predecessor, Sir Hyde Gowan, had resigned on account of ill-health, and died soon after reaching home The Ministry which took office in April 1937 was sharply reminded of the allegiance it owed to the Congress. Owing to internal dissension, Mr Khare the prime minister arranged a reconstruction of the cabinet in the regular constitutional method, the Governor dismissing one set of ministers and calling in another. The Congress authorities took exception to this, and ordered Mr. Khare, who defended his action before them, to resign He obeyed, and his rival, Pandit R. J. Shukla, became prime minister in his place. At an earlier stage, the only Moslem minister in the original cabinet, holding the portfolio of Justice, has been forced by public opinion to resign for improperly favouring a Moslem convict. In other respects the year was uneventful, though the province suffered from a very defective cotton crop. (ME.)

Area and Population:
Area 131,557 sq. miles.
Population (1931) 15,323,058.
Governor. Sir Francis Wylie, K.C.S.I.
Languages. Hindi (56 per cent), Marathi (31 per cent).
Religions. Hindu, Mohammedan.
Production 1936:
Number of factories 718
Averge daily no. of workers employed . . 63,186
Finance and Banking:
Revenue (1937–38) . . Rs 5,93,54,000
Expenditure (1937–38) . . Rs. 5,95,70,000
Motor Vehicles licensed (March 31, 1937): cars and taxis, 4,076, commercial vehicles, 2,119, motor-cycles, 732.

CEREALS: *see* GRAIN CROPS

CEYLON. The new constitution, in spite of its unusual features, continues to work without excessive friction, and the island has had a return of relative prosperity, its export values in the three chief industries—tea, rubber, and coconuts—having been better in 1937 than at any time since the slump in 1930 The new Governor, Sir Andrew Caldecott, has had to deal with a storm in a tea-cup over a young Australian planter, whom his predecessor, Sir Edward Stubbs, had ordered to be deported for his political activities The State Council censured Sir Edward for his action, and a commission of inquiry was held, which reported, *inter alia*, that the inspector-general of police, against whom accusations had been made, was guilty of no misconduct The Governor adopted this finding in the face of further protest by the State Council, and tension continues

A project has been sanctioned for large improvements to Colombo harbour at a cost of £1 million; they will include two new piers, an oil dock, and a deep-water quay (ME)

Area and Population:
Area 25,332 sq. miles.
Population (est. Dec. 31, 1937) 5,780,000
Chief Towns. Colombo (284,115), Jaffna (45,708), Galle (38,424), Kandy (37,147)
Governor. Sir Andrew Caldecott, K.C.M.G.
Languages. Sinhalese, Tamil.
Religions. Buddhist and Hindu the chief.

Primary, Sinhalese and Tamil. schools, 5,439; scholars: 417,339 boys; 275,101 girls.
English and bilingual: schools, 400; scholars, 91,745.
Miscellaneous:
Motor vehicles licensed (Dec 31, 1937): 20,181 cars and taxis, 6,816 commercial vehicles, 2,997 motor-cycles.
Wireless receiving set licences (Dec. 31, 1937) . 4,911
Telephones (1937) . . . 10,320 instruments

CHACO, an undeveloped region in South America (area: approximately 100,000 sq. miles), lying between Bolivia and Paraguay proper and subject of a serious controversy between them.

During the early months of 1938, negotiations for settlement were continued without success. Twice, in April and in June, agreement appeared near, but, owing especially to the recalcitrance of Paraguay, efforts failed of consummation. A proposal in June that Paraguay should cede Bolivia a port on the Paraguay River evoked a storm of

disapproval in Paraguay, and rumours that Paraguay was buying aeroplanes in Italy caused predictions that war would be resumed

Finally, a draft agreement was approved by both governments, and on July 21 a definite treaty was signed at Buenos Aires Territorial demands of both sides were reduced and the remaining area submitted to the arbitration of the presidents of the six mediating republics (Argentina, Brazil, Chile, Peru, U S A, Uruguay), who were to make the final award within two months of ratification of the treaty In lieu of the proposed ports, Bolivia was given "the amplest free transit" for goods from abroad through specified zones. On Aug 10, the treaty was approved by the National Constitutional Convention of Bolivia and by national plebiscite in Paraguay, and on Aug 29 formal ratifications were exchanged The arbitral award, giving Paraguay a boundary 275 miles from the Paraguay River and 69,000 sq miles of the entire disputed area, was announced Oct 10 On Nov 26, formal diplomatic relations were resumed between the two countries, leaving only the actual marking of the boundary to be done (*See* also BOLIVIA, PARAGUAY) (L W BE)

CHALIAPIN, FEDOR IVANOVICH, Russian bass singer, was born at Kazan on Feb 15, 1873, and died in Paris on April 12, 1938. A biographical notice of him may be found in the *Ency Brit.*, vol 5, p 196 He continued, in his later years, singing in Paris, London, and elsewhere; but in 1932 he made a new departure by appearing in a cinematographic picture as Don Quixote, with George Robey as Sancho Panza. His two publications were *Pages from My Life* (1927) and *Man and Mask* (1932).

CHAMBERLAIN (ARTHUR), NEVILLE (1869–), British statesman (see *Ency Brit Book of the Year*, 1938, p. 142), prime minister since May 28, 1937.

No British prime minister has had greater difficulties to face than had Mr. Chamberlain during 1938, and at the close of the year it was matter for satisfaction that, while his influence at home had been in no way impaired, his international reputation had been vastly increased. His dramatic flights to Germany during the Czechoslovak crisis of September, when he was widely hailed as the Saviour of the Peace, undoubtedly eclipsed his other achievements (*see, inter alia,* GREAT BRITAIN AND NORTHERN IRELAND); but in home politics as well as in foreign his was no easy task, though in at least two directions, namely, his insistence on rearmament and preparedness for war as a means of lessening tension and increasing the sense of security throughout Europe, and the conclusion on Nov. 17 of the Anglo-American Trade Agreement, he met with the approval of the vast majority of the people. His cabinet easily survived the resignations of Mr. Eden (Feb 20) and Lord Swinton (May 16), but some restiveness became apparent in the country through the continued bombing of British ships in Spanish waters (despite the Anglo-Italian Agreement of April 16), and similar incidents, culminating, after the Munich Agreement, in the resignation of Mr. Duff Cooper, First Lord of the Admiralty (Oct. 1), as a protest against the premier's foreign policy. A resolution of confidence signed by over 220 supporters in the Commons at the close of the November session, no less than the general trend of the post-Munich by-elections, suggested, however, that there was no general wish for Mr. Chamberlain's super-session

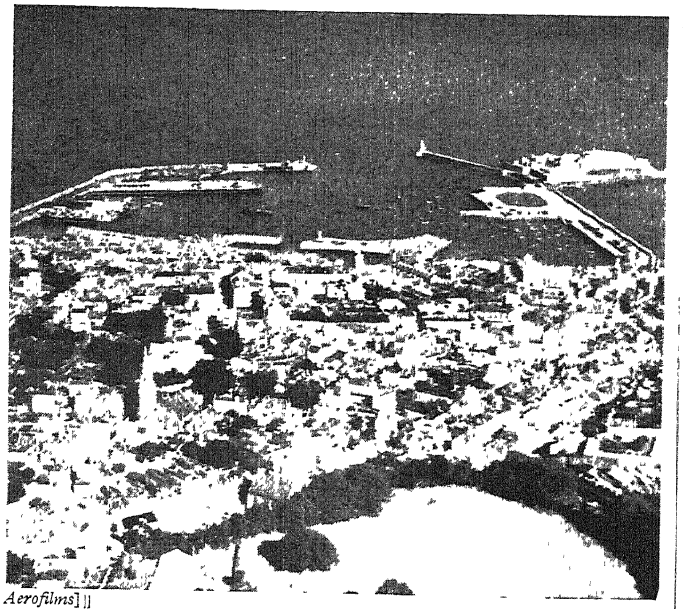
The prime minister and the foreign secretary (Lord Halifax) visited Paris on Nov. 23 and 24 and had clarifying conversations with MM. Daladier and Bonnet; and on Nov 28 it was announced that the two ministers would pay a similar visit to Signor Mussolini in Rome early in the New Year.

CHAMBERS OF COMMERCE. During 1938 the Association of British Chambers of Commerce took important steps to assist trade and industry Early in the year it assured the Chancellor of the Exchequer of its support in connexion with national defence, but urged that there should be no increase in the rates of direct taxes as this would cause disturbance to trade and restrict enterprise.

The Association called a special meeting of members engaged in export trade in October to discuss all aspects of overseas trade A report was issued in Jan 1939 making important recommendations to the government to overcome the difficulties now experienced by exporters in trading with many foreign countries It urged consideration of the present governmental machine for arranging new trade agreements, and suggested that such agreements should, in the future, secure definite purchases by foreign countries in return for the large purchases by the United Kingdom from such countries

A special committee of representatives of Chambers of Commerce was appointed to deal with all questions arising in connexion with the provision of Air Raid Precautions by industrial establishments and the government was urged to make a pronouncement on the subject of war-risk insurance of shipping, house property, goods, etc, so that a scheme might be available in any emergency.

An important report was drawn up on trade with the Soviet Union urging a larger purchase by it of British manufactured goods in return for British purchases of raw materials. The importance of employing British shipping in trade with the Soviet Union was also stressed.



Strong representations were made to the Chancellor of the Exchequer urging non-acceptance of the proposals of Germany to default on the Austrian loans, which question was eventually satisfactorily settled between the two governments.

The Association took an active part in connexion with the legislation before parliament, particularly the Coal Mines Bill and the Hire Purchase Bill The proposed new trade treaty with the United States also received special attention, and British firms were assisted in securing payment of outstanding debts for goods supplied to Nicaragua.

Two important reports issued concern the commercial employment of students with degrees in commerce and the training of artisans.

Throughout the year the Association has been constantly dealing with questions connected with national finance and taxation, home legislation, transport, postal affairs, education, overseas trade and tariffs, trade agreements, and all matters affecting the industrial and commercial interests of the country (R B. D.)

In the United States during 1938 the number and effectiveness of Chambers of Commerce were increased, and they continued to be an important part of the American business and social machinery There are now about 2,500, including other organizations operating somewhat similarly. Many of them undertook various types of public relations activities. Their purpose was to bring to the public a better understanding of business and the American system of free enterprise. They also showed a definitely greater interest in the continued increase in the cost of government, and adopted policies and activities directed at reducing public expenditures.

Aerofilms]

ST PETER PORT, GUERNSEY

CHANNEL ISLANDS. A group of nine islands off the coast of Normandy, constituting a self-governing British possession Jersey, the largest, has a separate administration, while Guernsey has jurisdiction over Alderney, Sark, Herm, and the other islands The main industries are agriculture and horticulture, the chief agricultural products being tomatoes and potatoes. Jersey cattle are widely known The islands are very popular holiday resorts. Granite is quarried in Jersey and exported to Great Britain. There are no railways in operation, but the larger islands have good motor roads. A regular air service links Jersey with Southampton and London; Jersey and Alderney have airports, and one is in course of construction in Guernsey Elementary education is under the States of Jersey and Guernsey, the authorities working in co-operation with the British Board of Education. A battalion of a British regiment is usually stationed in Guernsey: service is still compulsory in the Royal Militia of each island, but a sufficient number of volunteers is obtained each year to maintain the strength.

Area and Population:

Area 75 sq. miles (Jersey, 45 sq miles; Guernsey, 25 sq. miles)

Population (est. Dec. 31, 1936) 93,000

Chief Towns: St Helier (Jersey), St. Peter Port (Guernsey).

Language: official, French; spoken, English.

Religion. Christian.

Lieutenant-Governor. Jersey: Major-Gen. Sir H. de C. Martelli, K.B.E.

" " Guernsey: Major-Gen. Sir E. Broadbent, K B E.

Finance 1937:

Revenue: Jersey, £527,860, Guernsey, £433,659.

Expenditure: Jersey, £552,290; Guernsey, £425,242.

Public Debt (Dec. 31, 1937): Jersey, £1,277,590; Guernsey, £1,514,541.

Currency, sterling. own copper coins.

Miscellaneous: Motor vehicles licensed (approx. Dec. 31, 1937): Jersey, 11,000; Guernsey, 5,000. Telephones: subscribers, Jersey 5,505, Guernsey 4,521. (W.H.W.)

CHEMISTRY. Under this heading some recent advances in modern chemical research are briefly outlined.

Sterols and Sex Hormones. One of the outstanding chemical developments of recent years is the elucidation of structure and reactions of the sterols. In 1934, during the course of certain experiments on male urine, Butenandt isolated two substances, namely, androsterone, $C_{19}H_{30}O_2$, and dehydroandrosterone, $C_{19}H_{28}O_2$. Interest in this work was stimulated in 1935 by Ruzicka's synthesis of androsterone from cholesterol The steps required two catalytic reductions and an oxidation. Since then, Marker has simplified this synthesis, and still more recently Marker, Whitmore, Kamm, Oakwood, and Blatterman have announced the synthesis from cholesterol of 3-chloro-5-dehydroandrosterone from which any of the three naturally occurring male hormones (androsterone, 5-dehydroisoandrosterone, and testosterone) were obtainable. These investigators also have synthesized œstrone (theelin), one of the two female hormones, from ergosterol

Luteal hormone or "progestin", from corpus luteum, is the active principle responsible for the progestational modifications of the uterus. It was isolated in crystalline form through the work of Allen, Wintersteiner, and Corner.

In a series of articles written in 1938, Marker and co-workers described the isolation of a new compound named uranetriol from the sterol fraction of stallions' urine and of mares' pregnancy urine. The new parent hydrocarbon "urane" differs from the previously described "pregnane" only in the stereochemical configuration on position 9 The three hydroxyl groups in the triol are at positions 3, 11, 20 The isomeric 3,4,20-pregnanetriol was isolated concurrently. This is the first time in sterol work that adjacent hydroxyls (on 3 and 4) have been noticed, but very recently Marker has synthesized two other such compounds by oxidation of sitosterol and stigmasterol with selenium dioxide.

It is noteworthy that sex hormones, both male and female, and the luteal hormone all possess a skeleton closely related to the sterols, the bile acids, toad poisons, the digitalis group of heart stimulants, and the saponins. In interpretation of the possible biological origin of the steroidal hormones, the bile acids, and the cortical steroids, Marker has suggested that their precursor is not cholesterol, as has been formerly supposed, but is 4,8-pregnadiene-17,21-diol-3,11,20-trione. The various steroids are shown to come by orderly processes usually having their counterpart in the laboratory.

Vitamin B_1. Recent years have seen repeated successful attacks on the structure of the various vitamins. Vitamin A of fish-liver oils is an unsaturated alcohol whose carbon skeleton is composed of four isoprene units. (Isoprene is more familiarly thought of as the building unit of rubber. On standing, isoprene polymerizes to rubber.) Recent work with vitamin B_2 has established that riboflavin is one of its constituents. Vitamin C or ascorbic acid, present in fruit juices, has been proved to be related to the sugars. Vitamin D is formed by irradiation of ergosterol with ultra-violet light, from which its relationship to sterols and sex hormones is evident.

Vitamin B_1, the anti-neuritic vitamin, has been studied extensively during the past few years by R. R. Williams and co-workers, for which work Dr. Williams was the 1938 recipient of the Willard Gibbs medal in chemistry. Rice polishings are a rich source of this vitamin, but its rarity is evident when it is realized that only about twenty grams is present per ton of the chaff. By the best process of tedious extraction, about five grams per ton is actually isolable. This vitamin, isolated in this manner as a hydrochloride, is crystalline, and analysis revealed twelve carbon atoms in the molecule. On treatment with sodium sulphite and sulphurous acid, it was split into two parts, each containing

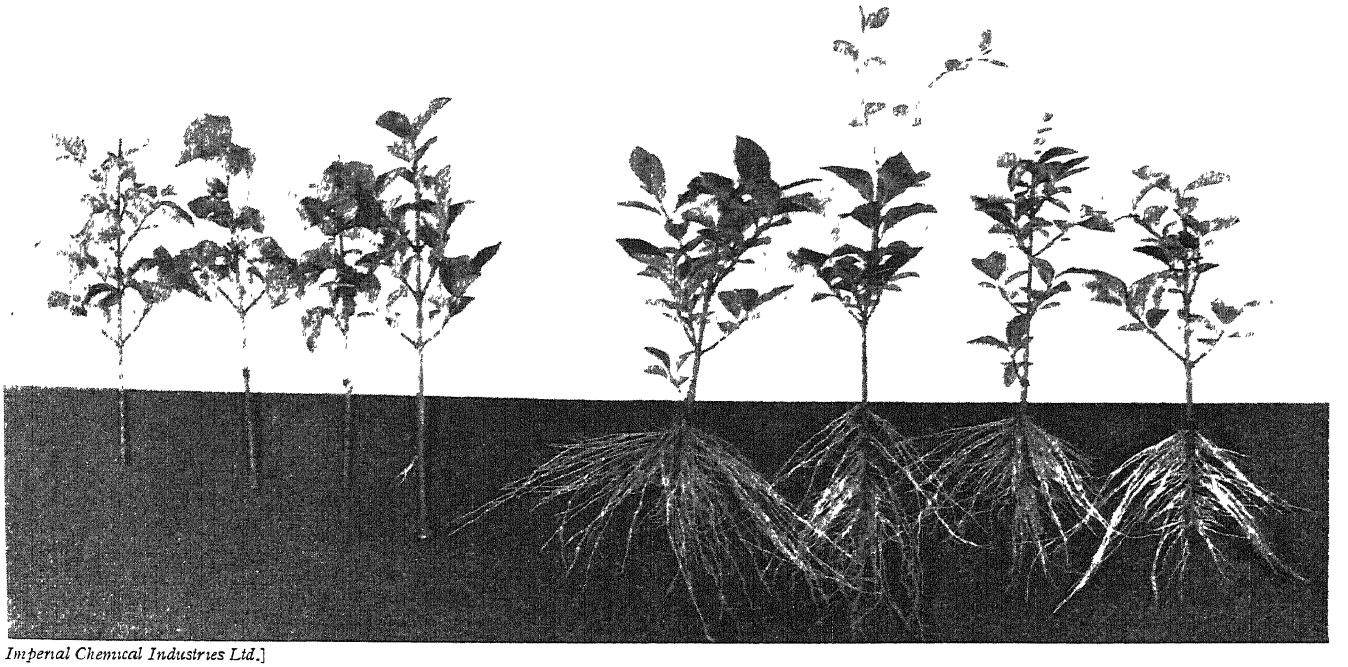
six carbon atoms One of these units was a pyrimidine and the other a thiazole The nitrogen atom of the thiazole was the point of attachment to the pyrimidine Synthesis of this vitamin was the direct consequence of this analytical information It constitutes a triumph of modern chemistry and completes a phase of work started by Williams a quarter of a century ago.

Petrol by Polymerization. When kerosene lamps were in vogue, before the day of the motor-car, the problem of the petroleum refiner was that of increasing the kerosene output at the expense of the petrol With the disappearance of lamps and the advent of motor-cars, this situation became reversed. The supply of " straight-run " petrol became increasingly less adequate until finally the " cracking process " came to the rescue As is well known, the mineral oils, which are represented as large hydrocarbon molecules, may become broken down into smaller, more volatile hydrocarbons by high-temperature methods of " cracking " or pyrolysis To illustrate, an oil which is too non-volatile for motor fuel might contain eighteen carbon atoms per molecule. On cracking, it might break into two smaller molecules of nine carbon atoms each. This smaller hydrocarbon would be satisfactory petrol It would be satisfactory also if the C_{18} broke into $C_{10} + C_8$ unit or even three C_6 units, but the trouble is that much of the pyrolysis gives rise to still smaller units which are gaseous and hence just as unfit for purposes of petrol as the original oil. Various uses for the gas have been devised, but to a large extent it has been used merely as fuel for the refinery furnaces.

It has been recognized for years that a major problem was that of recombining the smaller, gaseous hydrocarbon units into petrol. Thus, if two C_4 units (butylene) could be welded together, a C_8 molecule (octylene) would result Similarly, three C_3 units (propylene) could be visualized as the precursor of a nonylene (C_9H_{18}). This process is known as polymerization.

Although polymerization of olefines is not new, the industrial application of it is. In one recently installed process, yields of 3·3 to 10·9 gallons of petrol were realized per 1,000 cubic feet of cracked gases which contained 18–69 per cent of propylene and butylene. A commercial plant is in operation which is producing petrol at the rate of more than five gallons of petrol per 1,000 cubic feet of cracked gas.

Ipatieff and co-workers have been particularly active in this development. They found that phosphoric acid was very effective in promoting the polymerization Phosphoric esters, the addition products of the acid and olefine, were formed first: *e.g.* isopropyl dihydrogen phosphate, $H_2PO_4C_3H_7$, from propylene. At the temperature of the reaction involved (100–200° C.), two such molecules are considered to interact, regenerating the phosphoric acid ($2H_3PO_4$) and forming one molecule of hexylene, C_6H_{12}. By continuing the same mechanism, the C_6H_{12} may change further to C_9H_{18} or $C_{12}H_{24}$.



One feature about the polymer petrol is its high anti-knock rating. Such is the case because the carbon skeletons of the hydrocarbons produced are necessarily branched-chain, not straight-chain. Although the polymerization process is in its infancy in the petroleum industry, it bids fair to rise rapidly to a position of importance.

Mechanisms in Thermal Decompositions. The past few years have witnessed a remarkable development in understanding what goes on " behind the scenes " in organic reactions, especially in reactions of pyrolysis Tangible evidence for at least three mechanisms has been demonstrated, two of which were reported by Hurd and collaborators in 1938 A semi-ionic mechanism has been shown to apply for the thermal rearrangement at 200–250° C of unsaturated ethers into phenols, or the related rearrangement of allyl vinyl ether into allylacetaldehyde A mechanism involving a hydrogen bridge accounts satisfactorily for the pyrolysis at 400–500° C. of esters into acids and olefines The absence of other products such as aldehydes is evidence that preliminary scission of the ester into unstable parts or radicals cannot apply. Such a mechanism does apply, however, in the decomposition at 550–700° C of such compounds as paraffin hydrocarbons The radicals, formed initially, generally do one of two things decompose further into an unsaturated compound and a smaller radical, or react with the surrounding molecules of the original substance

In the last type of mechanism it is important to know the strength of bonds between atoms, because the initial split should come at the point of greatest weakness Rice has approximated the strength of the bond which breaks by finding the " activation energy " involved in the pyrolysis The activation energy plus the average energy of the molecules at the temperature of decomposition gives a satisfactory measure of the strength of the linkage which breaks. Experimentally, this activation energy was determined by passing the vapours of the compound rapidly through an evacuated tube heated to different measured temperatures and noting the time required to remove a standard metallic mirror of antimony by its combination with the reactive radical and subsequent volatilization. Since this time of removal depends on the concentration of radicals at that point, it is related also to the rate of dissociation of the original compound. If, therefore, the experiment is performed at two or more temperatures, the activation energy may be calculated.

As would be expected, there was considerable variation in the strength of various bonds. That between carbon and oxygen (in methyl ether) was stronger than the one between carbon and nitrogen (in trimethylamine). The former was 81,100 calories and the latter 50,800. The carbon-to-carbon bonds in ethane, propane, and heptane respectively were 79,500, 71,500, and 63,200 calories. This demonstrates a definite lessening in stability in passing from the lower to the higher members of the family of saturated hydrocarbons. Kistiakowsky observed a similar diminution of activation energies in the pyrolysis of tertiary butyl and tertiary amyl alcohols. The former 4-carbon alcohol gave 65,500 calories, whereas the latter 5-carbon alcohol gave 60,000. Generally, activation energies of 50,000–80,000 calories may be expected for such decompositions in the aliphatic series.

Subsequent reactions of the radicals proceed in the direction of lower activation energies. The methyl radical (CH_3), once formed, is prevented from changing into a methylene radical (CH_2) because at least 100,000 calories would be required. Other radicals such as ethyl, propyl, etc., may decompose readily enough. Only 49,000 calories are required to change ethyl (C_2H_5) into ethylene (C_2H_4) and atomic hydrogen (H). Still smaller energies are required for higher radicals. Even smaller energies are required for the radicals to appropriate hydrogen from neighbouring molecules on collision with them. Thus, the reaction: methyl + ethane (C_2H_6) to produce methane (CH_4) + ethyl requires only 20,000 calories A similar energy require-

PROMOTING ROOT GROWTH FROM PRIVET CUTTINGS BY TREATMENT WITH PLANT HORMONES ON THE LEFT, CONTROL, ON THE RIGHT, TREATED WITH HORTOMONE "A"

ment is involved in the change of atomic into molecular hydrogen (H to H_2) by collision with ethane New radicals are set up by these collisions and a chain of reactions is inaugurated

Such a reaction mechanism implies that pyrolyses could be induced at temperatures considerably below the ordinary decomposition temperature if only some supply of radicals was present This implication was substantiated in Allen and Sickman's work on acetaldehyde, and in Cramer's work on hydrocarbons. It happens that acetaldehyde is stable at 300° C , whereas azomethane gives rise to methyl radicals at that temperature A mixture of acetaldehyde and azomethane was heated to 300° C., with the result that a normal type of pyrolysis of the aldehyde was obtained. Hence, the methyl radicals must have initiated the breakdown of the acetaldehyde. Similarly, at 200–300° C., Cramer found that tetraethyllead in decomposing to ethyl radicals induced reactions with aliphatic hydrocarbons with which the tetraethyllead was originally mixed.

Fluorine Studies. The Swarts reaction, namely, the interaction of an alkyl chloride with antimony trifluoride, has been used by Henne in the synthesis of fluorochloroethanes and fluorochloroethylenes. It will be recalled that dichlorodifluoromethane (CCl_2F_2) is a compound which has assumed recent industrial importance as a non-hazardous refrigerant. It is prepared similarly from carbon tetrachloride. Henne discovered a new method of making organic fluorides, namely, by treating an organic chloride or bromide with mercuric oxide and hydrogen fluoride.

Mellor, *A Comprehensive Treatise on Inorganic and Theoretical Chemistry*, vol. XVI, which finishes the treatise started in 1922 with the publication of vol. I. (C. D. Hu.)

CHEMISTRY, APPLIED. During 1938 the results of commercial importance through the application of chemical research maintained a volume of new products that compares favourably in quality as well as in number with those of previous years.

In the first rank must be placed the new synthetic material named nylon, destined to become as familiar as such names as silk or cotton. Nylon is the generic name for all materials defined scientifically as synthetic fibre-forming polymeric amides having a protein-like chemical structure ; derivable from coal, air, and water or other substances ; and characterized by extreme toughness and strength and the peculiar ability to be formed into fibres and into various shapes such as bristles and sheets, etc. The first commercial application of the new product is in the form of bristles for tooth-brushes These do not splinter or soften to any material extent and accelerated tests show them capable of giving service for a time far in excess of that characteristic of other bristles.

No one can foresee the many applications to which this synthetic organic polymer may be put, but it seems certain that it will compete as has no other fibre with natural silk. It excels silk in those characteristics which heretofore have set silk above man-made fibres The first commercial unit for the production of the fibre has been started and hosiery of nylon should become available in the autumn of 1939 It should be emphasized that nylon is the first truly synthetic textile fibre

Another new fibre is "Vinyarn", derived from vinyl compounds which in turn are based on acetylene and chlorine. An improvement in the better-known fibres is found in "Teca", a cellulose acetate fibre with a permanent crimp, and in mechanical improvements for handling viscose rayon which have greatly speeded the production of the fibre from the viscose mass.

Lanital, the wool-like fibre from casein, has been improved and in the United States a process has been devised enabling various grades of casein to be used, which is not the case with the Italian process. Research has gone forward in production of a similar fibre from the protein in soya beans, and research in another direction has produced a cellulose fibre spun directly from the alpha-cellulose, thereby effecting considerable saving in time and investment in stock in process as compared with the rayon industry.

Advances were made in glass textiles where some characteristics depend upon the fineness of the fibre. Glass fibre

tapes were employed to a considerable extent in the electrical industry and applications for the textile included improved anode bags needed in electrochemical industries A method was developed for depositing an excessively thin metal coating on fibres, giving promise of metal cloth for women's wear

Motor tyres with improved rayon cord made their appearance for private cars and came into intense competition with cotton cords subjected to a new process to impart improved heat resistance

A new wrapping film was invented enabling waterproof waxy compounds to adhere to it, thereby bringing about a film that withstands a month of immersion before the waterproofing layer separates from the cellulose film back A slight etherification of the cellulose constitutes the improvement

Progress continued in the petroleum field with increased production of polymer petrol formed from petroleum refinery gases, increased production of the synthetic fuel iso-octane, of importance to aviation, and the commercialization of a new catalytic process for petroleum hydrocarbon refining. Formerly the production of petrol from a given crude oil was accompanied by certain by-products for which there might not be an immediate market. The new process is held to be of greatest importance in that it enables independent production of petrol with or without other derivatives as may be desired. The process is essentially a method of breaking down the large molecules of crude oil and rebuilding smaller molecules to the right size and type to make up the desired product.

It was announced also that glycerol is now produced on a commercial scale synthetically from petroleum gases. The quality is high and the cost low enough to compete with by-product glycerol from the soap industry.

The use of two organic chemical compounds (thiourea and methylamine) was found to enable the deposition of silver from plating baths of far better brightness than heretofore. A high-speed process involving special salts and anodes enabled the production of smooth, bright, heavy coatings of cyanide copper.

Silver was proposed as a lining for certain tins and a plastic coating to resist acids, alkalies, and some alcohols was perfected for containers

It was also found that by varying the conditions of plating, a wide range of colours without the use of dyes could be obtained on certain base metals.

Crude turpentine was found useful in preparing fuel oil, both quick-starting and anti-knock, for Diesel engines. A non-crystallizing rosin and also a hydrogenated variety were prepared providing improved raw materials for soaps, protective coatings, and paper sizing.

It was found that silicates in oil drilling fluids are potent in preventing the scaling and dispersion of heaving shale.

A new method of whipping cream was introduced. The common whipped product is dependent upon mechanical action only as a means of entrapping gases in the form of bubbles within itself. The cream is charged with nitrous oxide under pressure, and when discharged through a small valve it is instantly whipped because the gas is less soluble at the lower pressure.

Further research on the concentration of benzol vapour required was a step towards the perfection of that process for the control of blue mould on tobacco plants.

A process was demonstrated for the separation of coal from slate and shale by a sink-and-float method employing synthetic organic chemicals.

[*Imperial Chemical Industries Ltd.*

A WORKER USING A COLORIMETER, ENABLING THE DETECTION OF ONE-HUNDRED-MILLIONTH OF A GRAMME OF IMPURITIES IN DYESTUFF PRODUCTS

A lacquer was perfected for the protection of plated chromium and another for the finishing of rubber.

Propionates were introduced on a commercial scale to inhibit moulds and rope in bread Vitamin progress included a process for concentrating vitamin A to a substantially pure product, the isolation of vitamin K which is the diet factor necessary for coagulation of blood, and the discovery that vitamin C may be formed from fatty substances although chemically it belongs in the starch group. Riboflavin, which is vitamin B_2 and vitamin G, and also vitamin E have been isolated and commercially produced.

The preparation of hundreds of compounds of sulphanilamide enabled many experiments to be made, indicating that a far wider control of infection is possible with these compounds than had originally been predicted.

It was found that certain bacteria will turn wood sugars into various chemicals on a commercial scale.

Improvements were made in the synthetic compound with rubber-like properties, neoprene, including elimination of objectionable odours Thiokol was produced on a larger scale and the resin ethyl cellulose and a polyvinyl acetyl plastic were commercially introduced. The latter gives high promise for use in safety glass and as a plastic cement for thermosetting resins and metals. Ethyl cellulose and other plastics have been made sufficiently flexible to be extruded as an insulation on wire where comparatively low voltage is employed.

A lamp of unusual brilliance was introduced, consisting of a small tube containing mercury vapour under high pressure surrounded by a quartz jacket through which water under high pressure circulates. The increased pressure changes the mercury vapour spectrum from the usual blue-violet to a white. Fluorescent lamps of high efficiency were also introduced.

Plant hormones used for promoting root growth were dusted on trees and found to promote, and in some cases substitute for pollination.

In the textile field new groups of softening and finishing agents have come from applied chemistry. They leave materials free from odour and discoloration, and have no harmful effects upon the dyestuffs. A long list of new solvents, synthetic in origin and derived for the most part from gas, petroleum, and coal have made their appearance,

and the list of wetting agents has been considerably extended The new chemicals, pigments, and compounds comprise a long list

New water repellents for textile finishing have been provided, as have additional compounds for water softening A number of interesting applications of synthetic materials have occurred The use of methyl methacrylate resins as roadside reflectors to mark the sides of highways by reflecting light from headlights has proved successful Rods of this resin have also been used for throwing light exactly where wanted in dental and other surgical operations Light introduced at one end of the rod is emitted from the other with no escape from the side walls

The latest devices for the measurement and analysis of light have been applied to ensure accuracy and constancy of colour where a great many items are involved—such as drawings for a coloured movie cartoon. It has been found that vitamin A will promote the production of visual purple, a deficiency of which prevents perfect colour matching where this must be done over a considerable period of time as in assembly of enamelled parts where colour matching is important

CHEMOTHERAPY. During 1938, chemotherapeutic investigations have chiefly been concerned with further studies of the sulphonamide group of drugs and their application in the treatment of infectious diseases in man and animals It is now generally agreed that prontosil and sulphanilamide are of the greatest value in the treatment of puerperal infections due to hæmolytic streptococci, although their role in prophylaxis is questionable. In the treatment of other infections due to hæmolytic streptococci, such as erysipelas, tonsillitis, otitis media, mastoiditis, meningitis, pneumonia, empyema and pyelitis, the same compounds are also of great benefit. Streptococcal cellulitis is less affected, while infections due to *Streptococcus viridans* show slight but only temporary improvement; infections of the urinary tract due to *Streptococcus fæcalis* are resistant to sulphonamide compounds, but are rapidly cured by mandelic acid. While staphylococcal infections show little improvement when treated by sulphanilamide and prontosil, those due to meningococci, gonococci and, to some extent, pneumococci react satisfactorily to sulphanilamide Chancroid, Brucella infections, and diseases of the urogenital tract due to *Bacterium coli* also undergo rapid improvement after sulphanilamide therapy, while observations suggest that the same may be true of bubonic plague. Further investigations are required to determine the value of sulphonamide compounds in the treatment of gas gangrene, typhoid, and tuberculosis. Sulphonamide compounds have been tested in a number of virus infections, such as anterior poliomyelitis, herpes, virus myxomatosum, the rabbit fibroma virus, yellow fever, and Rift Valley fever without success In only two virus diseases, trachoma and lymphogranuloma inguinale, is there evidence that sulphanilamide brings about cure. Some evidence has been obtained that clinical cure can be produced by sulphonamide compounds in monkey malaria, but in malaria in man it is doubtful whether they are of any value.

Among other sulphonamide compounds which are now being used clinically in man and domestic animals are: (i) prontosil soluble, the disodium salt of 4′-sulphonamidophenylazo-1-hydroxy-7-acetylaminonaphthalene-3 . 6-disulphonic acid; (ii) rubiazol, 2 4-diamino-6-carboxy-4′-sulphonamidoazobenzene; (iii) proseptasine *p*-benzylaminobenzenesulphonamide, (iv) uleron, *p*′-aminobenzenesulphonyl-*p*′-aminobenzenesulphondimethylamide, (v) rodilone, 4 4′-diacetylaminodiphenylsulphone; (vi) M and B 693, 2-*p*-aminobenzenesulphonamido-pyridine, and (vii) a glucose derivative of 4 4′-diaminodiphenylsulphone A number of other compounds have been shown to exert a therapeutic action in experimental streptococcal infections of Buttle *et al*., 1938

Uleron is being used in the treatment of gonorrhœa, and appears to be as if not more, effective than sulphanilamide, although it may produce neuritis rodilone has also been used, especially in France, in the treatment of gonorrhœa. M and B 693, 2-(*p*-aminobenzenesulphonamido)-pyridine, was found by Whitby (1938) to be especially active in pneumococcal infections in mice as well as in experimental streptococcal infections.

2-(*p*-aminobenzenesulphonamido)-pyridine
(M and B 693)

It has now been tested with satisfactory results in man in pneumonia, meningococcal meningitis and gonorrhœa

The glucose derivative of 4 : 4′-diaminodiphenylsulphone introduced by Buttle, Gray, and their colleagues (1938) may also prove to have wide clinical possibilities.

All sulphonamide drugs produce toxic reactions. Mild reactions, such as headache, fever, nausea, and cyanosis, are common, but skin lesions are rarer, while such alarming sequelæ as acute hæmolytic anæmia and agranulocytosis are extremely infrequent.

Evidence is accumulating that the sulphonamide group of drugs acts more satisfactorily in association with specific immune bodies. This and other evidence, such as the action of M and B 693 in removing the capsules of pneumococci, suggest that the sulphonamide drugs act directly on pathogenic bacteria by interfering with their metabolism (cf Levaditi, 1938, and Whitby, 1938 [2]) Further observations are required to determine whether bacteria may become resistant to the action of sulphonamide compounds.

CHEMURGY. the term was not applied until 1935, when it was coined by Dr. William J. Hale, an organic chemist who was the first of his profession to advocate greater use of farm crops, as an avenue toward enlarging national wealth. It signifies the application of chemistry to the expanded consumption of farm-grown raw materials for other purposes than food and clothing. Dr. Hale pointed out that except for a two or three per cent content of minerals actually extracted from the soil, all plant growth is simply moist air transformed by sunshine into solid substance; and that, therefore, wealth-producing potentialities are virtually unlimited, in addition to being independent of the irreplaceable characteristic of mineral deposits.

Although it has elicited interest in other countries, chemurgy has been adopted as a working principle chiefly in North America. In the United States it received its

first conspicuous endorsement by the government in 1938 The Agricultural Act of the year included an appropriation of $4,000,000 for the establishment of four regional research laboratories to seek "industrial and non-food" uses for farm products The chemurgic movement gained an international character with the announcement of the formation of a Dominion Chemurgic Council in the autumn, designed to promote increased utilization of Canadian crops

While few of chemurgy's proponents have ever maintained that it was more than one sound approach to the agricultural problem which obviously would advance slowly, developments during 1938 appeared to indicate that it may have a large share in the eventual enlargement of agricultural income

The perfection of processes for manufacture of starch from sweet potatoes and advance in commercial use of the processes promised that Southern States might be able to supply the entire requirements of the United States for high quality starches, the imported quantity of which in 1937 reached 466 million pounds The imported starches, originally required to supplement domestic corn and potato starch, are mainly the product of casava, arrowroot, and tapioca. The sweet-potato starch appears acceptable for all the required uses. A co-operatively owned factory at Laurel, Miss., is in production A new scientific advance was announced during 1938 in the form of a cheap dehydrating process, expected to permit the sweet potatoes to be stored and thus to permit all-year instead of seasonal operation. Two new potato starch plants were launched at Houlton, Me, to use surplus potatoes with improved processes.

A significant chemurgic development of 1938 was the successful financing of the first Southern mill for the manufacture of newsprint. The mill, a $6 millions enterprise, is being built at Lufkin, Texas Within three years seventeen new mills for the manufacture of kraft papers were announced, several of which have been in steady production

Research was continued at Atchison, Kan., into the possibilities of making anhydrous alcohol as a motor-fuel supplement from farm cereals and other crops. In November it was reported that 7,000 gal. of alcohol were being distributed daily through Middle Western filling stations. Inadequacy of funds had hampered the Chemical Foundation, sponsor for the research, in its effort to make a complete demonstration of the economic soundness of power alcohol, which has been questioned on various accounts. The motor-fuel market is in excess of 20,000 million gallons. Ten per cent of this—that being the rate at which the anhydrous alcohol is usually blended with petrol—would require 2,000 million gallons of alcohol, the making of which would use crops for around 25 million acres of farm land. These figures indicate the attractiveness of the power alcohol project to those agriculturalists who hope for its eventual success. The fact that petroleum is not only irreplaceable but known to be exhaustible has lent attractiveness to the thought of an annually renewable source of fuel for internal-combustion engines. Proposals to hasten the use of power alcohol by tax differentials, as well as proposals for compulsory use, have been urged. The prevailing belief probably is that such proposals should await thorough exploration of the costs of production and careful economic studies.

Interest in the castor bean as a potential farm crop was stimulated during 1938 by a new process of dehydrating castor oil, converting it into a drying oil pronounced virtually equivalent in its qualities to tung oil. Research has also been conducted into the value of the castor bean stalk for cellulose, of the outer fibre, and of parts of the plant believed to have insecticidal values

At the U S. Regional Soybean Industrial Products Laboratory, Urbane, Ill., extensive research was continued into industrial uses for soya beans. Advances were reported in the use of the oil for paints and varnishes, especially with reference to quicker-drying qualities, and in the use of soya bean protein for plastics. A notable step was the discovery that proper hardening with formaldehyde of soya bean protein makes possible the production of a thermoplastic material.

In the laboratories of the Ford Motor Company research was instituted in an effort to produce from soya bean case in a fibre suitable for upholstery. Encouraging results have been reported. Increased quantities of soya bean material were used in plastics, in foundry cores, fire-resistant paints, in stearic acid and glycerin, as well as in enamels and other automobile essentials

CHESS. In England 1938 was a year of misfortune for chess on the executive side. The British Chess Federation lost by death, among others its president, Canon A G Gordon Ross, M.A.; its chairman, Major E. Montague Jones; Mr H. E. Dobell, hon. treasurer for 25 years, Mr. R. P. Michell, a member of the executive and one of Britain's leading players for forty years. Mr. J. F. Chance, president of the Imperial Chess Club, was also among those who have passed away Finally, Mr L. P. Rees retired from his office of hon. secretary of the British Chess Federation after very active and arduous service for 35 years

The new officers of the Federation are. president, the Hon. F G. Hamilton-Russell (formerly hon. treas.), deputy president, J N. Derbyshire; hon. treasurer, G S. A. Wheatcroft, and hon. sec., R. H. S. Stevenson, who, it is interesting to note, in Oct 1937 became the husband of Miss Vera Menchik, winner of the world's women's championship at Prague in 1931.

International tournaments were held during the 1938 season at Łódz (March–April) and Noordwijk (June), while the Plymouth Jubilee Congress (Sept. 5–10), in which Dr. Alekhine and the two Dutch internationals, L. Prins and T. D. Van Scheltinga, took part, may almost rank as such. At Łódz V. Pirc (Yugoslavia) took first place with 11½ points, Dr. Tartakover (Poland) was second with 10, and V. Petrov (Latvia), E. Eliskases (Germany, late Austria), and G. Stahlberg (Sweden) tied for third with 9½ points. Mrs. Stevenson was the only British representative. Eliskases, who defeated the former world's champion, Dr. Euwe, in the last round, was the winner at Noordwijk with 7½ points out of a possible 9; P. Keres (Estonia) was second with 6½, and Sir George Thomas, the only British entrant, seventh with 4. At the Plymouth Congress, which attracted over 100 players, Sir George Thomas and Dr. Alekhine shared first prize with 6 points each, neither losing a game. The remaining scores in the premier tournament were: P. S. Milner-Barry and P. M. List, 3½; Mrs. Stevenson, 3; H. V. Mallison and G. S. A. Wheatcroft, 2½; R. M. Bruce, 1. In the spring a tournament was held at Ljubljana, Yugoslavia, in which first place was taken by B. Kositch (10½ points), second by L. Szabo (10), and Dr. Tartakover and L. Steiner were bracketed third, with 9½.

The fourth Margate Easter Congress broke the record for any British meeting with 180 competitors. Dr. Alekhine won the premier with 7 points, and was followed by R. Spielmann (Austria), 6; V. Petrov (Latvia), 5½; and E. Book (Finland) and P. S. Milner-Barry, with 5 each. A "test" match, England *v.* Holland, was won by England, 5½–4½, after a draw of 5-all.

The British championship (Brighton, Aug. 8–19) was won by the brilliant young player C. H. O'D. Alexander (8 points), who had tied for second place at the 18th Hastings Congress, which finished on Jan. 6 (*see Ency. Brit. Book of the Year*, 1938, p. 149). H. Golembek and E. G. Sergeant were second (7½), and Mrs. Stevenson, the first woman to play in the championship, seventh with 5½. The British Ladies' championship went to Miss Musgrave, of Hastings, the City of London Chess Club's to E. A. Sergeant; and Lancashire, with Surrey running them close, won the Inter-County championship for the seventh time, being surpassed only by Middlesex, which has thirteen wins. E. Eliskases won the German championship (16 entries), and Dr. Euwe the Dutch (12 entries).

The year closed with one of the most important events in the history of the game, the double round tournament, arranged by the Avro Company of the Netherlands, between the eight leading masters, played in various towns of Holland from Nov. 6 to 26. As will be seen from the table above (in which W = won, D = drawn, and x = lost), honours went to the younger players, Fine and Keres—the latter of whom did not lose a single game—who were bracketed first.

It should be noted that Salo Flohr, who finished last in the above tournament, was in Aug. 1937 chosen by the International Chess Federation as official challenger to Dr. Alekhine's title of world champion, but at the end of 1938 it seemed more probable that Keres would be accorded that honour. (L. H. D.)

CHIANG KAI-SHEK (1886–), Chinese general and political leader, a native of Ningpo, Chekiang province. An account of his career may be found in the *Ency. Brit. Book of the Year*, 1938, p. 149. Despite the military reverses which by the end of 1937 had led to Japanese occupation of most Chinese territory north of the Yellow River and of the Shanghai-Nanking area, Chiang Kai-shek gave no indications of a desire to sue for peace. He maintained this steadfast attitude throughout 1938. After the fall of Canton and Hankow he issued a message to the Chinese people, declaring that it is better to be "a broken jade than a whole tile", and predicting ultimate victory as a result of Japanese exhaustion. He also forecast a new Chinese strategy of mobile attacks on the Japanese lines at various points by small bodies of troops. His prestige in Nationalist China remained undiminished, and a Kuomintang congress in March 1938 gave him the title of Tsung Tsai, literally "general planner", which carried an implication of dictatorial authority. (*See* also SINO-JAPANESE WAR.) (W. H. CH.)

CHICAGO. American city, port of entry, county seat of Cook county, Ill. The population of the city proper at the last Federal census was 3,376,438 inhabitants; that of the entire metropolitan area (1,119·29 sq. miles) 4,364,755.

After half a century of bitter political business and engineering controversy, construction was begun on Dec. 1, 1938, of an underground railway to provide better communication with the centre for this population, which had been dispersing into suburban areas at an increasing rate all the while transport facilities were lagging behind the needs of the city. The initial project for the underground calls for an expenditure of $40 millions, of which the Federal Public Works Administration contributed $18 millions, the remainder being taken from the city's traction fund made up of money paid under contracts with surface street railway lines. The tubes now under construction in State and Dearborn streets and Milwaukee Avenue will connect with existing lines of elevated railway.

Lack of housing was being partially remedied by a marked gain of residential construction in the latter months of 1938, a gain stimulated by the enactment of a more modern building code after delays which blocked progress for more than twenty years.

On Sept. 7, the new controlling works and lock at the

United States Lines]

AERIAL VIEW OF CHICAGO

mouth of the Chicago River were opened to navigation. Completion of these works and practical completion of 75 miles of new sewers, with sewage treatment plants and other structures, prepared the city for the reduction of 1,500 cu ft per second of water diverted from Lake Michigan, ordered to go into effect on Jan. 1, 1939, by the United States Supreme Court The entire programme of reduced diversion cost $58 millions, of which $42 millions was provided in loans and grants by the Federal Public Works Administration.

Chicago shared with the rest of the nation a substantial business recovery beginning in May 1938 Continued unemployment and large outlays for relief of the destitute were, however, the outstanding features of the labour situation.

Labour strife was at a low ebb throughout the year with no large numbers of workers on strike at any time, although a strike of a few hundred livestock handlers at the Union Stockyards closed that great livestock market for several days in November. The strike was settled by negotiation and did not interfere with the annual International Livestock exposition, which attracts visitors and animals from all parts of North America

The war on crime by State's attorney Thomas J. Courtney was carried on with continued success, and indictments pending against criminals were at the lowest figure ever recorded in Aug. 1938 A total of 1,269 defendants were sent to State prison and 90 per cent of all those tried were convicted. Murderers convicted totalled 75, of whom three were sentenced to death. Speed of trials in 1938 reached a point where 68 per cent of all criminals arrested were tried within thirty days of their offences.

In the State and national elections of 1938 Chicago favoured the Democratic party by substantial majorities. The last Republican members of the Municipal Court were removed by defeat at the polls. With the exception of suburban town and village officials, and suburban members of the Cook county board, the entire political administration is Democratic—a degree of party domination unique in the city's history.

CHILD LABOUR. While, up to Dec 1938, 28 States had reported ratification of the Washington (1919) Convention setting up fourteen as the minimum age for employment in industry, there are still a number of countries where children begin work at twelve or even earlier In Great Britain important changes in regard to juvenile employment were imposed by the Factories Act, 1937, which came into force in July 1938, and requires boys and girls under sixteen to be released from six o'clock in the evening, and by the Young Persons (Employment) Act, 1938, which limits the total number of hours which may be worked by a young person under the age of sixteen to not exceeding 44 It is estimated that at least 125,000 boys and girls will be affected by these two Acts The gap in the health services which formerly existed between school-leaving and entry into National Health Insurance was bridged when, in April, the National Insurance (Juvenile Contributors and Young Persons) Act, 1937, came into force, providing medical services for nearly one million employed juveniles

The parliament of Northern Ireland, in following the example of Great Britain in raising the school-leaving age, introduced a new factor in regard to "beneficial employment" of children, they may be employed half-time, provided they also give half-time attendance at a technical class with a minimum of fifteen hours per week. Meanwhile, in the same country, the Committee on the Instruction of Unemployed Juveniles reported in favour of the continued attendance of such juveniles at school or at junior classes specially provided.

In Switzerland, a Federal Law on the minimum age for workers, passed in June 1938, prescribes fifteen years as the minimum age for employment in certain industries In certain cantons where school attendance is compulsory up to fifteen or sixteen years, the new law will involve no change, but there are a number of cantons with a school-leaving age of between fourteen and fifteen years, and here many thousands of children were accustomed to enter artisan life or industry at these ages

Germany has also passed a new labour law (April 1938) which prohibits child labour in principle, but admits certain exceptions and imposes restrictions up to the age of sixteen. Thus, children of the age of twelve upwards may be employed for a maximum of two hours a day during school terms and four hours during holidays. Night work is prohibited up to the age of eighteen, and paid holidays for juveniles are provided for. (E F.)

The most important action in 1938 for the elimination of child labour in the United States was the passage by Congress of the Fair Labour Standards Act, which became effective on Oct. 24 This Act, in addition to fixing minimum wages and maximum hours of work, also prohibits "oppressive child labour" in industries "engaged in commerce or in the production of goods for commerce". Oppressive child labour is defined as employment of a minor under the age of sixteen years in any occupation, or employing a minor between sixteen and eighteen years of age in any occupation which the chief of the Children's Bureau finds to be hazardous or detrimental to the "health and well-being" of minors of that age It is not oppressive child labour under the act: (1) to employ children under sixteen in agriculture when they are not legally required to attend school; (2) to employ children as actors in motion pictures or theatrical productions; or (3) for a parent to employ his own child in an occupation other than manufacturing or mining

In addition to this act the United States Senate ratified on June 13 an International Labour Convention fixing fifteen as the minimum age for admission to employment on the high seas By 1938 ten States had established sixteen as the minimum age for employment (G AB)

CHILD WELFARE. The League of Nations Advisory Committee on Social Questions, which includes the former Child Welfare Committee, at its 1938 meeting reaffirmed its adherence to the Declaration of Geneva (Declaration of the Rights of the Child). The special subjects of consideration by sub-committees were the boarding-out of children in families, the recreational aspects of the cinema, the position of the illegitimate child, and the protection of children in time of war Boarding-out had been the subject of a world survey during the years 1936–38, in which 42 countries collaborated, and the conclusions of the report—a valuable summary of the standards which have found world-wide acceptance—were unanimously endorsed by the committee. Important child welfare conferences were the thirteenth congress of the Association Internationale pour la Protection de l'Enfance (of Brussels), held at Frankfurt-on-Main in June and attended by 545 delegates of 24 nations; the second Balkan Conference on Child Welfare, under the auspices of the Save the Children International Union of Geneva, held at Belgrade in October, and attended by over 200 delegates; and the British National Conference on Maternity and Child Welfare, under the patronage of Queen Mary and the Ministry of Health, which brought over 500 delegates to Bristol.

Public concern at the falling birth-rate in Great Britain, not materially affected by a slight tendency to rise during the last two years, found expression in the Population Act, 1938. This Act, which followed precedents set by New Zealand, Australia, and several European countries, is designed to ascertain facts about parenthood, and to find out what assists or impedes fertility. The falling birth-rate was also one of the principal subjects of discussion at the National Conference on Maternity and Child Welfare. An important measure which passed its second reading was the Adoption of Children (Regulation) Bill, 1938, which provides safeguards (by way of inspection of homes and medical examination of children) for the health and welfare of children who are the subject of adoption orders. Attention was focused on the growing practice of leaving children alone in the house during the parents' absence, with grave physical and psychological risks. The National Society for the Prevention of Cruelty to Children suggested that the law should be amended to deal with the problem, possibly through local maternity and child welfare committees. Arrangements were made in four places in the Special Areas (the Rhondda, Whitehaven, Jarrow, and Walker-on-Tyne), whereby the maternity and child welfare authorities started cheap-milk schemes in conjunction with the Milk Marketing Board. A pint of milk per day was made available to expectant and nursing mothers and to children under school age at a cost of twopence. The milk is delivered to the homes by the retailer, on the order of the Medical Officer of Health, and the Children's Minimum Council is pressing for the extension of this experimental scheme to the whole country.

Two significant recommendations relating to the foundations of child welfare work may be recorded. At the tenth Pan-American Sanitary Conference at Bogota (Colombia) in September, the compulsory notification of pregnancy was recommended; and the adoption by maternity institutions and public health authorities of a definition of *prematurity*

London County Council]
NURSERY SCHOOL AT MILE END, LONDON

as a birth weight of 5½ lb (approximately 2,500 grammes) or less was recommended by the British College of Obstetricians and Gynæcologists

Typical of the increased emphasis which governments are placing on child welfare was the action of the French Supreme Council for Child Welfare, set up under a Decree of September 1937, in making its first task the codification of all laws, regulations, etc, concerning children. In Belgium the Civil Code as it relates to illegitimate children was modified by a new law of March 1938, whereunder the powers of the patronage organizations for the care of such children were extended, and in Hungary special attention was given, through the welfare centres, to what is described as a "population policy" aiming at "more and better Hungarians".

Maternity allowances were introduced in Sweden and in Greece; and, under the comprehensive Social Security Act, 1938, in New Zealand. In Ontario (Canada) the Needy Mothers' Assistance Act provides benefits for women with at least two dependent children.

Germany, where both maternity benefit insurance and the organization of welfare work are on a voluntary basis, increased to over 23,409 its permanent maternity and child welfare centres under the mother and child section of the National Socialist Welfare Organization (E. F.)

It is impossible to evaluate in brief compass trends and conditions throughout the world in their effect on the well-being and happiness of children. On the one hand, children suffered from war and threat of war; from denial of rights and opportunities which had been regarded as elemental and inviolable; and from lack of balance between resources and facilities devoted to the care and protection of children and those available to other groups in the population. On the other hand, gains were made in certain international and national measures for child welfare, and public interest in the conditions in which children come into the world and receive nurture and training during the years of immaturity mounted as the issues which will determine the destinies of nations and of peoples became more clearly defined.

The year 1938 was the second full year of operation of the Social Security Act in the United States, under which

the State and the Federal government co-operate in providing maternal and child health services, crippled children's services, and child welfare services Federal aid has made possible marked improvement and extension of these services for children, but great needs for further health protection and for medical care remain unmet. Recommendations for amendment to the Social Security Act to provide increased resources for maternal and child health have been made by advisory committees to the Children's Bureau, the State and Territorial health officers, the Conference on Better Care for Mothers and Babies held in Washington in Jan. 1938 under the auspices of the Children's Bureau, and the National Health Conference held in July at the suggestion of the President to consider a national health programme.

Recommendations for strengthening the provisions of the United States Social Security Act relating to aid to needy dependent children have been made by the Social Security Board and transmitted to Congress by the President. According to the recommendations, the ratio of Federal contribution should be increased from one-third to one-half, the maximum amounts specified in the law should be raised, and the age limit for aid to children regularly attending school should be raised from ten to eighteen years Under existing provisions relatively greater assistance is given to the needy aged than to needy dependent children

Under a law effective in 1939, the national government of Sweden is to make grants to the provinces of that country for providing dental care, free or at a nominal charge, to adults and children. The Brazilian government established an Institute of Child Care, which will be a centre for research and education The French government provided for the establishment of "preventoriums" for children and adolescents with mild forms of tuberculosis

Australia enacted a social insurance law requiring every person more than fourteen years of age, who is in private employment, to be insured. In return for the premiums paid by them each insured person will receive medical services and cash payments in case of illness, and an old-age pension when he is eligible for it. Payments are also made under specified conditions to survivors of insured persons, including orphans less than fifteen years of age

A new Federal juvenile-delinquency act went into effect in the United States, applying to persons seventeen years of age or under who commit offences under Federal law (not punishable by death or life imprisonment), though many elements of criminal procedure are retained. A modern juvenile-court act for the District of Columbia was enacted. Marked improvements in laws relating to State and local public services for children were made in Louisiana, Massachusetts, Mississippi, and Virginia. (*See* also JUVENILE DELINQUENCY.)

Switzerland's new Federal penal code, to be effective Jan. 1, 1942, lays down general rules for the cantons to follow in dealing with juvenile delinquency, leaving the details to individual cantons. The Brazilian government provided for establishment of a National Council of Social Service. Supervision of all children under fourteen boarded in foster homes in France was provided for in a decree in June. Previously such supervision was given only to children under two years of age. President Roosevelt sent to the U.S. Congress for ratification two conventions adopted at the 1937 session of the International Labour Organization. These provide for a basic minimum age of fifteen years for employment of children in both industrial and non-industrial occupations, exclusive of agricultural and maritime work, and for a higher minimum age in occupations that may be determined to be hazardous or unhealthful for young workers. The convention providing for a fifteen-year minimum age in industrial occupations was ratified by the Norwegian parliament. (K F. L)

CHILDREN'S BOOKS. Many of the books for children published in Great Britain in 1938 are remarkably well produced and illustrated Such a tendency has been noticeable in America for some time, and English publishers are making great headway in this direction The use of lithography, in both black and white and in colour, gives added beauty to the work of the artists who are giving their attention to book illustration Especially in books for the very young reader, pictures are as important as the story.

The most successful writers for very small people are those who make animals their heroes. Small children accept animals on equal terms, without any sense of superiority or patronage. This accounts for the success of stories in which animals talk and take part in the human world. M de Brunhoff, in *Babar at home*, the further adventures of Babar the Elephant, Molly Kaye, in *Black Bramble Wood*, and Kathleen Hale, in *Orlando, the marmalade cat*, are among the best of such writers, and all these books have gay illustrations and clear type.

Older children like stories of real animals in the wild. *Red Ben, the Fox of Oakridge*, by J. W Lippincott; *The Grey Hare*, by Svend Fleuron; and *Tawny goes hunting*, by Allen Chaffee, are excellent.

The adventures of those lucky children who have ponies to ride are told by Joanna Garland, in *Another pony for Jean*, and in *Fortune's foal*, by G. Bullivant. Out-of-door activities are the subject of some of the best of the recent children's books, for the joys of exploring, camping, and caravanning are now familiar to the young folk

The Compass always points North, by M. E. Atkinson, and a second book by the young authors of *The far-distant Oxus*, Katherine Hull and Pamela Whitlock, called *Escape to Persia*, are stories of youthful adventure far from city streets, exciting without the meretricious aid of buried treasure or hidden passages

The fairy tale still has its place. Patricia Lynch, in *King of the tinkers*, has re-created an enchanted Ireland of changelings and leprechauns, in which Cuchulain and the ancient warriors "come into the hours of the present from the days of the past" and take part in the wild free life of the tinkers.

Older girls—and their elders—will enjoy *She shall have music*, by Kitty Barne. The writing and the delineation of character are perfect, and the pencil drawings subtly underline the humour.

In a third book on Chinese life, Elizabeth Foreman Lewis has written an excellent story, *China quest*, which will create a feeling of friendliness and understanding towards a foreign people.

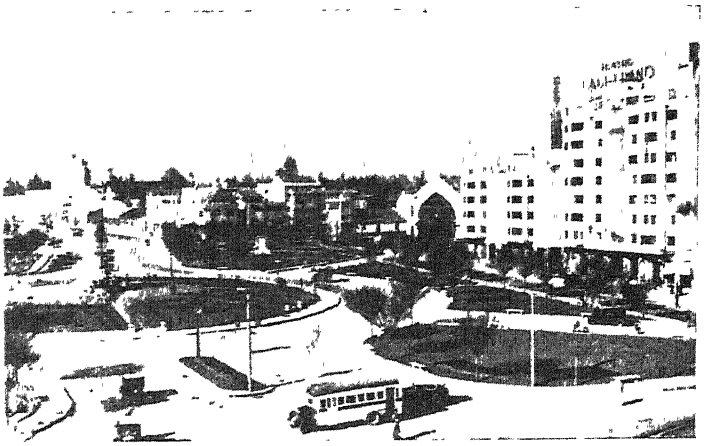
There are two good school stories: for girls—*Alison Temple, prefect*, by Winifred Darch; for boys—*King Willow*, by George Mills. In both the interest is in the characters, not in improbable events Boys who like historical stories will find excitement in *Who rides in the dark? Dickon of the Lenape Indians*, by M. R. Harrington, and *Tal of the Four Tribes*, by Herbert Best, are both good. Finally there is a fine collection of *Stories for girls*, edited by Kathleen Lines, including work by many authors of literary distinction. (R. E. BA.)

United States. Publications for 1938 averaged well in general content and were more conservative in format

than in the preceding year Emphasis was continued on books for little children, but important books appeared in other classes The annual John Newbery Medal was awarded in June to Kate Seredy for her epic legend *The White Stag* as the most distinguished contribution to American children's literature during 1937 The first annual award for the most distinguished American picture book of 1937 was won by Dorothy Lathrop, illustrator of *Animals of the Bible*, the text of which was selected from the Authorized version of the Bible by Helen Dean Fish. Miss Lathrop is a well-known artist and author, having many other admirable books to her credit .

Among current picture-books the names of many earlier producers were repeated Monro Leaf and Robert Lawson followed their *Ferdinand* by *Wee Gillis*, a rollicking Scotch tale in pictures and text that appeal immediately to children's interests. Kurt Wiese is found at his best in his illustrations for Alice Alison Lide's *Yanka-tu the Yak*, a simple, informative story reflecting Tibetan life and customs Another leading picture-book was *The Forest Pool* by Laura Armer, which graphically conveys the beauty of an old Mexican jungle by means of a simple story of adventure and full-page illustrations in rich colour *Mei Li* by Thomas Handforth was an attractive contribution to the picture-book age and those older. For originality and imaginative quality, *Quito Express* by Ludwig Bemelmans deserves special mention. *East of the Sun and West of the Moon*, a selection of Norwegian tales edited from the Dasent translation by Ingri and Edgar Parin d'Aulaure and illustrated by them, was one of the most beautiful books of the year.

While picture-books with foreign backgrounds held first place in the year's output, biography was not far behind. *Leader by Destiny* by Jeanette Eaton proved an excellent account of the human George Washington. *Penn* by Elizabeth Janet Gray was another equally absorbing life-story exceptionally well told. *The Young Brontës* by Mary Louise Jordan revealed the childhood of that amazing family. Following their series of musical biographies for younger children, Sybil Deucher and Opal Wheeler produced an artist biography in *Giotto Tended the Sheep*.



Books in the fields of science and useful arts emphasized actual experiences in occupations, travel, and exploration. *T-model Tommy* by Stephen Meader, *French Canada* by Hazel Boswell, *At Grips with Everest* by Stanley Snaith, *The Baby Giant Panda* by Ruth Harkness, *The Book of Insect Oddities* by Raymond L. Ditmars are examples.

Outstanding fiction included *We Didn't Mean to Go to Sea* by Arthur Ransome, *Benja's Hat* by Mabel Leigh Hunt, *At the Sign of the Golden Compass* by Eric Kelly, *The Hobbit* by J. R. R. Tolkien, and *Bound Girl of Cobble Hill* by Lois Lenski.

The Song of Roland, a prose translation from the Old French by Dr. Meriam Sherwood, was the finest contribution to literary classics for young people. An important bibliography was *From Peter Parley to Penrod* by Jacob Blanck.

Total juvenile publications (not including pamphlets, textbooks and new editions) were: United States 895, England 969. Some of the books referred to were published in both countries, simultaneously, or at close intervals

CHILE, a republic on the west coast of South America; language, Spanish; president, Pedro Aguirre Cerda; area, 289,776 sq. m. Population (Dec. 31, 1937) 4,287,445, with more North European elements than any other Hispanic-American country, German-Chileans being preponderant in some sections. The chief cities are: Santiago, the capital (843,870), Valparaiso, the principal port (approx 200,000).

Chilean Consulate London]

SANTIAGO, CHILE

With a presidential election due in October, 1938, the several Chilean political parties had united into two groups, roughly "Right" and "Left", with the Left, or Popular Front, as originally constituted including the Communist and Chilean Nazi ("Nacista") parties, although the latter tended toward independent action. President Alessandri had become a moderate and associated with the Conservative Right, and supported as his successor Gustavo Ross, minister of finance and reputedly the wealthiest man in Chile. The opposing candidate was Pedro Aguirre Cerda, a millionaire landowner, choice of the Popular Front.

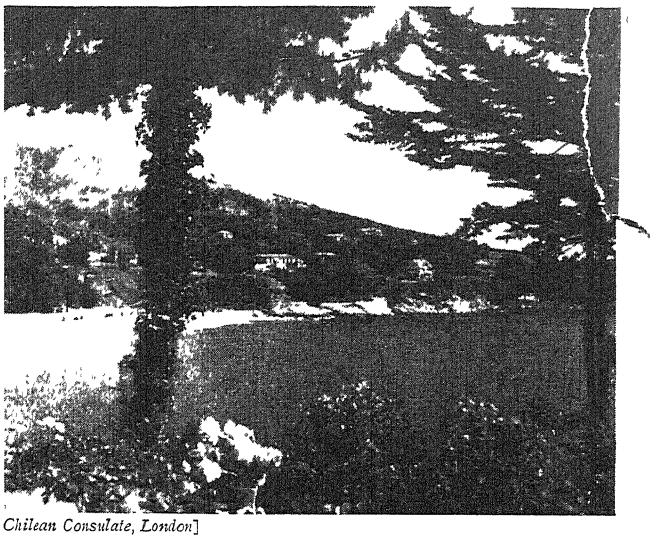
From the beginning of the year the Nacistas, headed by Jorge González von Maree, began to harass the government and to attempt to publicize their party platform. A sensation was created at the opening of Congress in May when González von Maree, a member of Congress, interrupted the President's speech by firing a pistol shot In the gardens of the Palace of Congress, a bomb was exploded. González was arrested, but released. On Sept. 5, as the campaign was approaching white heat, a Nacista *coup d'état* was attempted. Public buildings were seized, but after four hours of fighting the rebels were suppressed. The death roll was 62.

Subsequent investigation showed that the revolutionaries had planned to assassinate both Alessandri and Ross. Government precautions were therefore taken against further troubles. President Alessandri was given extraordinary powers, press censorship was imposed, and a four-months' state of siege proclaimed. The latter, however, was lifted for the final 20 days of the election campaign, and later reinstituted, but without censorship. Carlos Ibáñez, former president, who was closely associated with the Nacistas, was accused of complicity and arrested; as were González von Maree and other Nacistas. González was sentenced to 20 years' imprisonment and perpetual disbarment from public office; others of his party received terms of imprisonment. Ibáñez was released on Oct. 23, on the eve of the presidential election, and left the country.

The essential issues of the political campaign between Ross and Aguirre were those of conservatism and liberalism, with business interests behind Ross, and agricultural and debtor interests preferring Aguirre and further inflation. Contrary to the expectation of political observers, Aguirre was the victor with a majority of 4,000 votes on a total of 500,000. The election eve endorsement of Aguirre by the Nacistas, who controlled an estimated 15,000 votes, was

regarded as having turned the scale Immediately after the election the issue was so much in doubt that Ross demanded a recount, but leftist demonstrations against " government interference ", and the possibility of revolution, caused him, in a fashion typical of Chilean fair play, to concede the election Ross himself then left the country for an extended rest abroad On Dec 24 Pedro Aguirre Cerda was formally inaugurated president of Chile. The new administration, the first Popular Front government organized as such to come into power in the Western Hemisphere, began forthwith to effect changes. The new president immediately pardoned Jorge Gonzalez von Maree and all others implicated in the abortive September revolt, restoring full political rights to them. On December 27, seven generals who had been prominent in suppressing that rising, among them the chief of staff, were retired from active service. Ex-president Alessandri, forbidden by the Constitution to leave the country for six months after the close of his term without permission of Congress, was granted leave to rest in Europe A nation-wide reduction in bread prices was decreed, and the working day of government employees increased to eight hours Formal recognition of the Soviet Union was recommended to Congress, but had not been acted upon at the close of the year. On Dec 31, ex-president Ibánez, who had been in voluntary exile in Argentina since his release from prison in October, returned by air and was welcomed by uniformed Nacistas.

Education. Primary education is free, non-sectarian, and compulsory. In 1937 there were 3,467 primary schools (enrolment, 447,717), 85 secondary (enrolment, 29,062), and numerous special schools. There are three universities, the National university of Chile and two parochial universities, with a total enrolment of 6,454 in 1937.



Defence. Chile has an army of 29,435 men, with a reserve of 177,434 The navy consists of a single battleship and numerous secondary ships. It was formerly the most up to date in South America, but has declined considerably. During 1938 bids for two modern cruisers were opened. Chile has over 75 military planes.

Finances. The monetary unit is the peso (value: approx *2d*). The 1938 budget called for the sum of 1,620,981,000 pesos.

Trade and Communications. Freight service on the Trans-Andine line by way of Uspallata pass, suspended since interruption by landslides in Jan. 1934, is in process of re-establishment. Railways connect the northern ports of Arica and Antofagasta with Peru and Bolivia. An all-the-year highway from Lima (Peru) to Valparaiso exists. Highway communication to Argentina across the Andes is open except during the winter, but plans for utilization of already existing railroad tunnels through the Andes are expected to make winter use possible.

A railway system of 5,113 miles length and largely government-owned, extends to Puerto Montt in the south. Plans are under way for partial electrification and for streamlining trains on government-owned lines. Communication with the far south is primarily by boat and aeroplane. Air transport service is well developed, with routes totalling 2,666 miles in length. A highway system of over 12,000 miles length, including 2,300 miles of first-class roads, is being rapidly developed under a comprehensive programme adopted in 1937.

The Chilean merchant marine is the largest of any Hispanic-American country, and carried about 6 per cent of Chilean water commerce. A new government-supported Chilean navigation line was inaugurated in Feb. 1938.

Chilean Consulate, London]
ZAPALLAN, THE CHILEAN SUMMER RESORT

Chilean foreign trade in 1937 exceeded that of 1936 by 51 per cent Exports (947,789,000 pesos) were 68 per cent greater, and imports (428,866,000 pesos) 24 per cent. Imports came principally from the United States (29 1 per cent); Germany (26 per cent); Great Britain (10·9 per cent); and Peru (8·1 per cent). Exports went especially to the United States (23·1 per cent); Great Britain (19·8 per cent); Germany (9·5 per cent); Belgium (5·9 per cent), France (4·9 per cent); Italy (4·4 per cent), Sweden (3·8 per cent), with all but France increasing their proportions over 1936. The first nine months of 1938 showed imports increasing by 28 per cent, exports experienced a sharp drop (34 per cent), due to a decline in copper, to 508,800,000 pesos for the period.

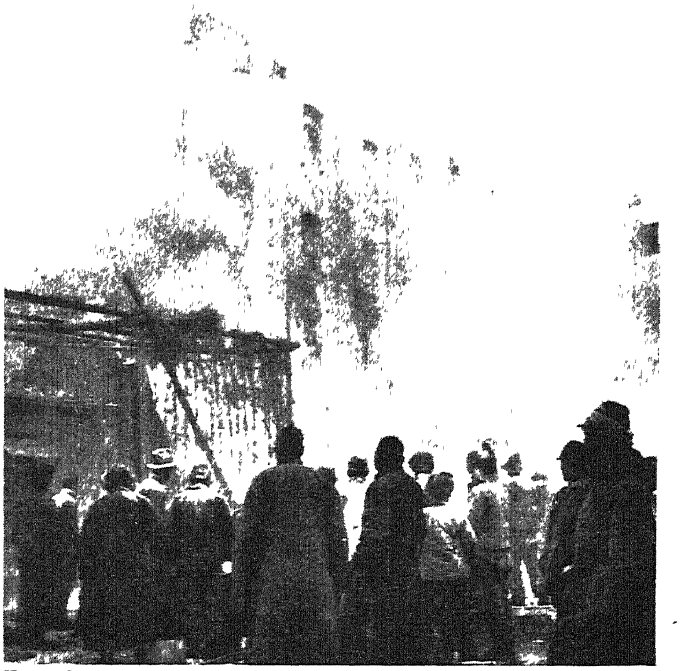
Imports are predominantly textiles and machinery. Exports are chiefly mineral products (copper 54 per cent, nitrates 20·3 per cent, other minerals 6·3 per cent, in 1937); non-mineral exports are wool, frozen meats, and hides, and miscellaneous agricultural products, especially wine, cereals, and legumes.

Agriculture, Manufactures, Mineral Production. Mineral production is chiefly of copper and nitrates, with totals dependent upon foreign demand and consequently shifting violently from year to year. Copper production in 1937 (413,185,666 kg.) was the greatest on record, in 1936 it amounted to 15 36 per cent of the world total. Production in the first nine months of 1938 declined 16 per cent, but exports fell off much more. In 1936–37 Chile produced 1,315,200 metric tons of nitrates and by-products. Chile is the only important coal producer in South America (nearly 4,000,000 metric tons in 1937), and produces 75 per cent of the continent's output, almost exclusively for domestic consumption. During 1937, 9,815,026 grams of gold was produced, an all-time record

Although minerals are the chief exports, agriculture is the leading industry, with its products largely for domestic consumption. For the season 1938–39, 1,700,000 acres were sown in cereals, primarily wheat, with considerable oats and barley. Potatoes and various legumes are grown extensively. In 1936 there were 251,600 acres devoted to viniculture. The pastoral industry is important in the south, with cattle and sheep the principal animals. Textiles are the principal manufacture, with cement and electric power next.

BIBLIOGRAPHY George McCutchen McBride, *Chile: Land and Society* (New York, 1936). (L. W. BE.)

CHINA. Excluding those areas over which no effective Chinese sovereignty has been exercised for many years (Manchukuo, Outer Mongolia, Tibet), China has an area of 2,845,740 sq. miles and a population of 418,479,000 (estimate of directorate of statistics in Nanking). No comprehensive census has ever been taken. Population of larger cities: Nanking (estimated, 1937), 1,000,000; Shanghai (foreign and Chinese administrative areas reckoned together, census of 1935), 3,490,762; Peking, 1,487,289; Canton, 861,024; Hankow, 777,993; Tsingtao, 440,135.



For the Sino-Japanese war, *see* that heading. A so-called People's Political Council consisting of delegates elected from various provinces, held several meetings during 1938 and was regarded as an unofficial agency of popular expression.

Education and Religion. Normal educational activity has been seriously affected by the war and the movement of vast numbers of refugees from one part of the country to another. There has been a transfer of higher educational institutions from such occupied cities as Peking, Nanking, Shanghai, and Tientsin to towns in the remote interior, such as Chengtu in Szechuen, and Kunming in Yunnan. Optimistic observers see compensation for the dislocation of life in the Japanese occupied regions through the spread of education and enlightenment in the formerly backward interior.

China's main religions are Buddhism, Taoism, and Confucianism. There are between 5,000,000 and 10,000,000 Mohammedans, mostly in the north-western and far-western provinces of the country. There were 2,818,839 Catholics and 512,873 Protestants in China at the beginning of 1935.

Army. On the eve of the outbreak of the Sino-Japanese war the Chinese armed forces, organized in sixteen route armies and 51 armies (the route armies are larger military units) consisted of 2,271,330 men, of whom 1,996,920 were under the direct control of the National Government, the remainder constituting provincial forces. There are no reliable reports of the forces engaged or of casualties in the present hostilities. Chiang Kai-shek is believed to have maintained fairly intact a force of 150,000 to 200,000 picked troops, and soldiers from Kwangsi Province, in the south-west, have given a good account of themselves in the war, probably because Kwangsi had one of the most efficient provincial systems of conscription and military training. (*See* also SINO-JAPANESE WAR.)

Finances and Banking. The unit of currency is the yuan, or dollar, which was worth 1*s.* 2·1*d.* at the end of 1937, but had fallen to 7·76*d.* by the end of 1938. The budget for 1937–38 was supposed to be balanced at 1,000,649,496 dollars, but the outbreak of the war unquestionably affected both income and appropriations. No subsequent budget has been published. According to the budget of 1937–38 the chief items of revenue were supposed to be customs receipts (36·9 per cent); the salt tax (22·85 per cent), and the consolidated tax, a levy on trade and industry (17·55 per cent). All these sources of revenue have been gravely impaired by the Japanese occupation of China's main ports and industrial centres, and of some of the chief salt-producing areas. The war has been financed largely by loans and by a policy of drastic retrenchment in government expenses, while munitions and supplies from abroad have been paid for largely with exports of silver and by drawing on reserves in foreign banks. The three largest and most important banks in China are the Central Bank of China, the Bank of China, and the Bank of Communications. There are also fourteen Japanese and nineteen other foreign banks which carry on business in China.

FIRE BREAKS OUT IN A NORTHERN CHINESE TOWN AFTER BOMBING BY JAPANESE AIRCRAFT

Trade and Communications. China's imports amounted to 941,545,000 Chinese dollars and exports to 705,741,000 dollars in 1936. Exports were stimulated by the abandonment of the silver basis of the currency in 1935 and the depreciation of the Chinese dollar. China's exports during 1937 amounted to 838,255,705 Chinese dollars, imports were valued at 953,386,007 dollars. During the first ten months of 1938 exports were 636,009,325 dollars (732,756,914 dollars in the corresponding period of 1937), imports were 739,722,005 dollars (856,094,663 dollars in 1937). Japan's occupation of Canton in October closed up the most convenient remaining route between Nationalist China and the outside world and increased the difficulties of carrying on foreign trade. China's main exports are eggs and egg products, silk, cotton, wood-oil, ground-nuts, seeds of various kinds, tea, and various ores and metals, including wolfram and antimony. Its main imports are metals, machinery, chemicals, dyes and paints, petroleum, and tobacco.

China had between 6,000 and 7,000 miles of railways at the end of 1936 and a five-year plan for the construction of 5,300 additional miles after 1936. Highway construction, which had increased substantially during recent years, reached the figure of 56,000 miles in 1935. According to a report of the ministry of communications in 1931, China had 2,986 registered ships, with a tonnage of 431,892. China has no trans-oceanic shipping lines, and much of the coastal shipping is in the hands of British and Japanese firms. A total of 87,755 ocean vessels entered and cleared at Chinese ports in 1936. British ships represented 16,000,000 tons; Japanese 9,500,000, and Chinese 7,300,000. The government telephone system in 1935 served 21 cities and 62 others were served by private and provincial systems. About 250,000 telephones were in use. China has 53,000 miles of telegraph lines and several high-power radio installations.

China Campaign Committee]
CHINESE SOLDIERS HELPING FARMERS TO GATHER RICE, LESS THAN TWO MILES FROM THE YANGTZE WESTERN FRONT

The war with Japan had a varied effect on China's economic development. It brought great misery to a large part of the population as a result of acts of devastation carried out by both sides. By the end of 1938, much the greater part of China's railway network was in the possession of the Japanese army. Japan had also taken over the communication systems in occupied territory. On the other hand, railway and road construction in the unoccupied south-west was stimulated. A new railway line was opened between Hengchow in South Hunan and Kweilin in Kiangsi, and two other lines (between Kweilin and Nanning, capital of Kwangsi, and between Nanning and Lungchow, on the border of French Indo-China) are under construction. Road communication in the remote interior also improved and a new motor road between Kunming, capital of Yunnan Province, and the Burma frontier was opened for traffic There has also been some industrial building in the interior, although this presents more difficulties than railway and road construction. In 1938 there was a marked industrial revival within the limits of the International Settlement of Shanghai. This was partly attributable to the flight of Chinese capital and labour from regions under Japanese occupation

The chief cities of China are linked up by air routes, which often serve as a substitute for non-existent rail connexions. Commercial aviation is in the hands of the Sino-American China National Aviation Corporation and the Sino-German Eurasia Aviation Corporation.

Agriculture, Manufactures, and Mining. China is an overwhelmingly agricultural country, and is predominantly a land of small-scale farming. As many as 36 per cent of its farms are less than 1½ acres in size, while 62 per cent are less than 4·3 acres. Rice is the main crop and the main food in the southern and central part of the country, while wheat, millet, kaoliang, and other grain crops are raised in the north. Animal husbandry is little practised, as there is little spare land for pasturing. China has fallen behind in the production of its traditional tea and silk because of lack of standardization and grading; efforts have been made recently to improve quality and increase output of tea, silk, and cotton.

Coal is China's most important mineral. The geological survey of China in 1934 estimated the country's coal reserves at 238,555,000,000 tons, of which more than half was in the mountainous north-western province of Shansi (now largely under Japanese occupation) and almost a third in the neighbouring Shensi. China's annual output of coal is about 20,000,000 tons. China leads the world in the production of antimony and tungsten. It is very poor in other important sources of mineral wealth, in petroleum, iron, copper, gold, and silver. Total deposits of iron are estimated at about 250,000,000 tons, of which about 90,000,000 tons are in Chahar province, while a considerable part of the remainder is to be found in Hupeh and Anhwei provinces, in the valley of the Yangtze. Iron-ore output is at the rate of about 2,000,000 tons a year. Manufacturing industry, in the modern sense of the term, is still in its infancy in China, and is largely concentrated in a few large centres, such as Shanghai, Tientsin, Canton, and Hankow. Cotton mills, silk filatures, flour mills, cigarette factories, cement works are among the most common types of industrial enterprises. The fighting in the Shanghai-Nanking area was a terrific blow to China's industrial development, since a great number of factories in the region were destroyed or badly damaged.

Japan has extensive plans for the reconstruction of industry in those parts of China which have passed under its military control. Two semi-governmental corporations, the North China Development Company, capitalized at 350,000,000 yen, and the Central China Development Company, capitalized at 100,000,000 yen, have been established for the exploitation of these two parts of China. No large enterprises have yet been undertaken, partly because of lack of capital, partly because of unsettled conditions off the railway lines. Japan hopes in time to obtain iron ore from the Lungyen fields (north-west of Peking) and the Tayeh deposits (near Hankow), cotton from several provinces of North China, and coal from Shansi A certain amount of industrial salt is already being obtained in the neighbourhood of Tientsin. The Japanese cotton mills which were destroyed by the Chinese before they abandoned Tsingtao are being slowly rebuilt. (W. H. Ch.)

CHURCH OF CHRIST, SCIENTIST. For the Christian Science movement throughout the world, 1938 was a period

of steady progress This was the case, not only in the United States, but also in other countries Even in Germany, the growth of the movement has not been stopped by the tendency of National Socialism to become an exclusive interest, nor by German restrictions on church collections and on the importation of books and periodicals

The number of Christian Scientists in the United States continues to exceed the number in all other countries, but within the United States the conspicuous growth of the Christian Science movement has moved westward from New England to the Pacific Coast Of the United States, California now has the largest number of Christian Scientists

In the United States and Canada, and to some extent in other countries, the Church of Christ, Scientist, has made an increased use of radio Likewise, *The Christian Science Monitor* has continued to develop its broadcast, " The Monitor Views the News ", which consists of editorial comments on important news of general interest. In 1938, a Christian Science lecture was broadcast from Hobart, Tasmania.

The Christian Science denomination (Dec. 1, 1938) included 2,825 churches and societies, besides many Christian Scientists living where local congregations are not yet organized There were 2,167 churches and societies in the United States, 307 in Great Britain, eighty in Germany, and 271 in other countries, including those most distant from Boston (Australia, New Zealand, and South Africa) There were 65 Christian Science Organizations at colleges or universities, and 11,216 practitioners engaged exclusively in Christian Science practice.

CHURCH OF ENGLAND, THE. Apart from the international crisis, the 400th anniversary of the open Bible and the publication of the Doctrinal Report (*see* ARCHBISHOPS' COMMISSION (DOCTRINAL REPORT)), there were few individual events of really outstanding interest. The Church continued, largely through the activities of the archbishop of Canterbury, to exercise a vigorous influence on the public life of the country. It was a year of consolidation and quiet progress in Church affairs, though marred by the prospect of the addition of heavy financial losses under the Coal Bill to the capital loss of some £17,750,000 resulting from the Tithe Act of 1936, a situation to meet which every possible adjustment is being made by the Ecclesiastical Commissioners and Queen Anne's Bounty. Both of these institutions suffered a heavy blow by the sudden death of Sir George Middleton in October.

The Recall to Religion. The work of following up the Primate's Recall to Religion went steadily forward, and the bishop of Leicester, chairman of the Archbishops' Evangelistic Committee, was able to record in this connexion, in the pages of *The Official Year Book of the Church of England*, " much cause for quiet encouragement ". The number of Easter communicants in 1937 (published in 1938) was 2,225,880.

Church and Cathedral Building. It was a year of active church extension work in all the new housing areas both in the north and in the south—work which was facilitated by the Central Loan Fund operated by the Central Board of Finance, as well as by various diocesan appeals. The work of reorganizing the cathedrals went forward under the Cathedral Commissioners. Steady progress was also made with the building of the great cathedrals of Liverpool and Guildford, and with the extension of that of Portsmouth. An appeal for £25,000 was launched to place the upkeep of Southwark Cathedral on a satisfactory permanent footing, and in October the Princess Royal attended a ceremony in connexion with the extension of Blackburn Cathedral. There was further rapid progress in the building of the Church House, Westminster

The Church Assembly, the Convocations, the Church Congress. Among the measures passed by the Church Assembly were the Parsonage Measure, 1938 (Royal Assent, June 23 . the Ecclesiastical Commissioners (Powers) Measure, 1938 (Royal Assent, June 23); the Faculty Jurisdiction Measure, 1938, which makes faculty jurisdiction more effective and gives statutory recognition and functions to the Diocesan Advisory Committees (Royal Assent, July 13); the Queen Anne's Bounty (Powers) Measure, which gives the Bounty additional powers, especially as regards the application of augmentation moneys and the abatement and extinguishment of charges upon benefices (Final Approval, June 24); and the Premunire (Appointment of Bishops) Abolition Measure, the object of which is to abolish the penalties of Premunire in relation to the appointment of bishops (Final Approval, June 24). In February the Church Assembly approved of the proposed World Council of Churches (*see* ANGLICAN COMMUNION, THE), and in June it approved of the setting up of a Council on the Christian Faith and the Common Life, proposals for which had been initiated by the archbishop of Canterbury and representatives of the larger Churches in Great Britain: " (i) to help in rebuilding the bridges between the Christian understanding of life and the ordinary activities of men, by stimulating thinking and investigation, (ii) to provide means of consultation between the Churches and facilitate common action; and (iii) to co-operate with the World Council of Churches, if it is formed, in furthering all efforts to awaken among Christians a sense of the Church of Christ as a universal society, to which the evangelism of the world is committed by God ".

The subjects before the Convocations of Canterbury and York included an important scheme for a declaration of the meaning of " lawful authority " in the Declaration of Assent, the Doctrinal Report, the appointment of bishops, and the status of deaconesses.

The Church Congress, which is usually held triennially, met at Bristol from Oct. 4 to 7 under the presidency of the bishop of Bristol (the Right Rev. C. S. Woodward). The general subject was " The Gospel to this Generation ".

Four-fold Education Policy. At a meeting on Jan. 12 of the Consultative Committee of the National Society (the Central Council of the Church for Religious Education), the archbishop of Canterbury presiding, the following four-fold policy was outlined by Viscount Sankey, chairman of the Standing Committee of the National Society, and approved: (1) To continue the policy of supporting the Church schools system, building Church senior schools, and ensuring that in all Church elementary schools the buildings should be adequate according to modern standards. (2) To give increasing attention to Church of England children in council schools. (3) To promote closer co-operation between the National Society and the dioceses. (4) To bring all teachers in Church schools into closer co-operation with the deliberations of the National Society, through conferences and membership of committees.

Retirements Announced. In addition to the losses by death already recorded (*see* ANGLICAN COMMUNION, THE), announcement was made during the year of the forthcoming retirement of the bishops of London and Durham.

(4) To bring all teachers in Church schools into closer co-operation with the deliberations of the National Society, through conferences and membership of committees.

Retirements Announced. In addition to the losses by death already recorded (*see* ANGLICAN COMMUNION, THE), announcement was made during the year of the forthcoming retirement of the bishops of London and Durham.

Other Events. Missionary work is dealt with *s.v.* Anglican Communion, but reference must be made here to the appeal launched by the archbishop of Canterbury on behalf of Anglo-Indian schools, and to the publication in June by the Missionary Council of the Church Assembly, of *The Healing Church*, the sixth Unified Statement of the Work and Needs of the Church Overseas. Finally must be recorded the increasing interest of the Church in films throughout the year, the centenary of the Guards' Chapel in May; the Jubilee of the diocese of Wakefield, also in May, and last but far from least, the universal stirring of all hearts which filled Westminster Abbey and innumerable other churches during the crisis (R. S.)

CIGARS AND CIGARETTES. The year 1938 showed a still further increase in the amount of tobacco consumed in Great Britain. For the ten months' period ending Oct. 31, 1938, the quantity retained for home consumption amounted to 157,504,022 lb., which compares with 151,209,340 lb. in the same period of the previous year. The latest report of the Commissioners of Customs and Excise also shows that the duties collected on tobacco were £5,500,000 greater than the Chancellor's Budget estimate. In effect this means that the cigarette smoker who consumed 100 a week last year now smokes 106½. Actually the *per capita* consumption is 3·97 lb. against 3·71 lb. in 1937. Although this is the fourth highest among European countries, it is still far below the American average.

Cigar consumption in Great Britain continues to show a slight falling away. For the eleven months ending Nov. 1938, Cuba exported to the United Kingdom 16,385,760 cigars valued at $1,664,319, against 20,109,336 ($2,135,281) in the same period of 1937. Nor was this trend confined to Great Britain alone if the total Cuban figures be considered. Exports to all markets during the eleven months were 30,417,487 ($2,945,211) against 33,310,160 ($3,479,233) in 1937.

Much the same might be said with regard to America if the details issued by the Bureau of Internal Revenue are taken into account. These show that during the first nine months of 1938, tax was paid on 3,763,246,069 cigars; this compares with 3,971,024,593 in the same period of 1937. Cigarettes, however, showed an upward trend, the comparative figures being 124,232,519,066 and 123,336,525,174; in other words, there was an increase of 895,983,892. This movement is practically world-wide, and in support of this statement the latest details from two widely separated countries, the Netherlands and Mexico, might be adduced. Imports of cigarettes into the Netherlands from all sources during the first six months of 1938 totalled 210 million pieces, compared with 190 million pieces in the corresponding period of 1937. From Mexico, the Ministry of National Economy reports production valued at 52,051,121 pesos against 45,203,135 pesos in 1937. (D. L. H.)

CITY PLANNING: *see* TOWN AND COUNTRY PLANNING.

CIVIL LIST PENSIONS. Under the Civil List Act, 1937, the amount allowed to be granted in any one financial year to account of pensions, which for over 100 years have been awarded by the Crown to "persons who have merited the gracious consideration of their sovereign and the gratitude of their country", was raised from £1,200 to £2,500, and in the 1938 List the whole of this sum was allotted. The following pensioners received additions varying from £20 to £50 per ann.: Miss A. M. Buckton, Mrs. A. M. Carey, the Rev. H. W. Clark, D.D., Miss R. M. Fleming, Sir James Marchant, the widows of Stephen Phillips and G. R. Sims, M. P. Shiel, Miss B. Thorne, and Dudley Wright.

New pensions were awarded as follows:

£210 in trust for the three children (and during the minority of any one of them) of the archæologist, James Leslie Starkey, who was murdered by Arabs near Hebron on Jan. 10.

£160 to Rutland Boughton, the composer of *The Immortal Hour*.

£130 to Frank Elgee, archæologist and geologist.

£120 each to A. J. Finberg, art critic, and the widow of George Sheringham, artist and designer of stage scenery and costumes.

£110 each to James Reid Moir, F.R.S., archæologist, and the widow of H. A. Pegram, R.A.

£100 each to W. A. Bewes, authority on international law, John Glyn Davies and John Herbert Jones, for their services to Welsh literature, the daughter of the late John Drinkwater, poet and dramatist; Miss Alice Everett, M.A., in recognition of her own and her father's services to physics, etc., Professor J. J. Guest, formerly of Birmingham University, the promulgator of "Guest's Law" (*Ency. Brit.*, vol. 15, p. 58); Robert Machray, novelist and writer on foreign affairs, and the widow of Fred Pegram, R.I.

£75 each to the daughter of the late Dr. A. Dupré, F.R.S.; and to the widows of T. Leman Hare and F. H. Townsend, in recognition of their husbands' services to art, of J. Gwili Jenkins, Welsh author and theologian, of J. W. N. Sullivan, author and late reviewer for *The Times*, etc., and of Stephen Wheeler, the late authority on Landor.

CIVIL SERVICE. During the year ended April 1, 1938, the personnel of the British Civil Service continued to expand, and at its close (exclusive of industrial staffs and Ministry of Labour branch managers and local agents) totalled 376,491 (275,085 men and 101,406 women), an increase of 20,152. Every department, except the Ministry of Pensions (2·4 per cent decrease), was "up", the Post Office (*q.v.*), the largest employer, accounting for 60 per cent of the total and 49 per cent of the increase. Expansion and acceleration of shipbuilding and armament production and the growth of the Royal Air Force caused an addition of 3,325 to the staffs of the defence departments, which totalled 22,249; the Ministry of Labour staff increased by 1,769 to 26,934 through the expansion of the live register of unemployed persons, that of the Ministry of Agriculture and Fisheries by 1,021 to 4,588 through the coming into force of the Agriculture Act, 1937, and acceleration of the Ordnance Survey; and that of the Home Department by 428 to 12,390, mainly through A.R.P. The staff of the Inland Revenue was increased by 743 to a total of 24,342, and of Customs and Excise by 211 to 14,669; additional work resulting from the transfer of duties from local authorities (see *Ency. Brit. Book of the Year*, 1938, p. 524) on April 1, 1937, mainly accounts for the rise in the staff of the Unemployment Assistance Board from 7,643 to 8,105, increased work in connexion with voluntary contributory pensions (*Ency. Brit. Book of the Year*, 1938, pp. 441–42) brought the staff of the Ministry of Health from 6,454 to 6,771, while the staff of the Board of Trade expanded from 4,396 to 4,611 through the administration of the Coal Act, 1937, and expansion of the Mercantile Marine and Patents departments. Ex-servicemen in government departments totalled 172,841.

The movement for placing women on an equal footing with men as regards pay has not yet met with success, but

improvements in salary were secured during 1938 for several thousand clerks employed in the War Office and at Air Ministry outstations, the increase amounting in the former case to, at the maximum, approximately £80 and in the latter to approximately £35 per annum. In addition to these, the Civil Service Arbitration Tribunal awarded in October improved pay scales for the various grades of Post Office workers, the amounts varying from 5*s.* to 6*s* 6*d* per week.

Towards the end of the year steps were taken by the Civil Service Clerical Association, the Ministry of Labour Staff Association, the Inland Revenue Staff Federation, and the County Court Officers' Association to replace the Civil Service Confederation, a body embracing the executive, clerical, and minor and manipulative grades in the Service and representing it on the National Whitley Council, by a new organization, the Civil Service Alliance, with central executive control of policy. The four associations mentioned comprised 80 per cent of the membership of the confederation, the balance consisting mainly of small groups (L. H D)

United States. The progress of the merit system in the Federal government proceeded during 1938 on two lines. Congress, after a long delay, enacted legislation placing over 14,000 first-, second-, and third-class postmasters under the merit system. This victory is greater than might be suggested by the numbers involved, since local postmasters have traditionally been an important cog in the political machines of both parties, and a convenient contact between congressmen, their constituents, and the postal employees. An executive order of President Roosevelt on June 24, 1938, extended the merit system to all positions not affirmatively excepted by legislation, an estimated total of about 100,000. This order, effective from Feb. 1939, will expand the Federal classified service to about 650,000. Meanwhile, the extension of the merit system to all remaining Federal positions except those policy-forming in nature was barely defeated in the House after favourable action in the Senate on the so-called Reorganization Bill. This bill will be given renewed attention in 1939.

The principal debate during 1938 concerned the proposal to replace the United States Civil Service Commission by an Administrator. Both the Senate and the House of Representatives approved the proposal, which was a part of the Reorganization Bill, but it was defeated on final roll-call in the House, partly as a result of a misdirected campaign of opposition to a " dictator " bill.

CLASSICAL STUDIES. While archæological research continues to widen our knowledge of ancient civilization on the material side, we owe a still greater debt to archæology for the mass of literary material unearthed from the tombs and rubbish-heaps of Hellenistic Egypt. Among *papyri* recently discovered or published, there are some fragments of great interest, though not of great bulk, comprising as they do portions of lost works of Aeschylus, Sophocles, and Euripides.

Modern editors of classical texts are hampered by accumulated masses of emendation which have found their way into our editions : a good example of conservative work in textual reconstruction is Gilbert Murray's *Aeschylus*, lately produced by the Oxford University Press, while Sir David Ross has done fine work both for the text and the interpretation of Aristotle's *Physics*.

The ever-increasing demand for editions with a translation on the opposite page to the original is gradually being met by the *Loeb Library* and the *Belles Lettres* series. These works, in which many well-known English, American, and French scholars have collaborated, are of value, not only to the general reader, but to the specialist, for they all contain scholarly texts of the authors, some of whom have hitherto been accessible, if at all, only in antiquated editions. We may instance Athenæus, Philo, the Roman tragedians, and the Greek novelists.

Apart from literature pure and simple, the general interpretation of ancient life and thought is an important branch of study. The Homeric question is never finally answered, and much has been written of late years on the structure of the poems. The late Milman Parry regarded epic technique as a mechanical process, whereby a series of lays forming the *Iliad* and *Odyssey* was improvised out of a rich store of stock-phrases ; others, such as J. T. Sheppard, and more recently J. L. Myres, believe that all the details were carefully arranged according to a preconceived plan. Martin Nillson's *Homer and Mycenæ* contains an admirable review of the situation and other valuable contributions to Homeric study. J. W. H. Atkins's *Literary Criticism in Ancient Times* traces a continuous current of thought through Greek and Roman writers ; G. C. Richards's *Cicero* gives a clear picture of the orator's life and works ; E. E. Sikes's *Introduction to Lucretius* is a valuable guide to students. Horace, whose bi-millennium produced a great crop of literature, has an aftermath in E. K. Rand's lectures on *Horace and the Spirit of Comedy*. (J. F. D.)

CLEVELAND, a city of North-east Ohio, occupies 73·74 sq. miles. On July 1, 1937, the population was estimated at 924,400.

Reorganization of the city's police department was an outstanding accomplishment of the administration of Mayor Harold H. Burton in 1938. The city's traffic fatalities in 1938 were almost 50 per cent less than the 1937 total, while traffic injuries were reduced by about one-third. The General Assembly's refusal to place relief on a permanent basis led to sit-down strikes in January and May. The Lake Shore Electric railway, one of the country's few remaining electric inter-urban lines, suspended operations on May 15, and on July 17 all passenger service on the Wheeling and Lake Erie railroad was suspended. At a special election on Dec. 21, voters approved a $3 millions mortgage bond issue to expand the municipal electric-light plant. Work was begun in May on the Main avenue high level bridge across the Cuyahoga River, which, with its approaches, will cost $7,200,000 ; and in October on a project to straighten and improve the channel of the Cuyahoga River to make it navigable by the largest lake freighters.

CLINICS : *see* PUBLIC HEALTH SERVICE.

CLOTHING INDUSTRY. Following the difficult period experienced by the clothing industry in 1937, due to rising wool prices, increased wage bills, and the economic strains of the National Defence Contribution, many looked to 1938 with optimism. But the weather proved contrary, and as rumours and counter-rumours of war gained firmer hold, business became increasingly unsettled, unemployment rose, and many branches of the industry continued to decline. The manufacturers of the cheapest grades of clothing appear to have suffered most, those concerned in the highest-priced products least : midway between came the big multiple firms, doing business that was mediocre.

The average monthly proportion of unemployed in the tailoring industry, during the first eleven months of the year, amounted to approximately 7¾ per cent of the total number of insured persons aged 16–64 ; a considerable rise

from the 6½ per cent average during the corresponding period of 1937. British trade abroad, too, provided a sharp reflection of world affairs For example, the total exports of suits and overcoats from the United Kingdom showed a decrease of approximately 21 per cent in value in 1937; while corresponding imports dropped 31½ per cent Perhaps the sole consolation of the slump was that it enabled the industry, while, so to speak, marking time, to consolidate the progress continually being made in methods of production. The main trend is still in favour of increased specialization in details and intermediate processes: more and more manufacturers are concentrating on producing one article in its highest state of efficiency such as the production by one large firm of ready-padded undercollars and ready-built-up interlinings: altogether a welcome trend, since it leads to reduction in labour costs, saving in material, and simplification of stocking and matching. A further contributory factor of this "specialization" to the present-day speeding-up of production is that, by simplifying the routine in individual firms, it releases skilled labour and machines for other work.

From the public point of view, another noticeable trend was the constantly increasing demand, even in the cheaper lines, for made-to-measure clothes as opposed to ready-mades. The taste and discrimination of the man-in-the-street can definitely be said to be improving in this respect: in a word, he is becoming more "clothes-conscious". Worsteds held their own as the most popular material, with blue in various shades and designs as the predominant colour. There was a gradual decline in popularity of "sports" jackets and flannels in favour of the new, neat, two-piece type of suit cut comfortably in an informal cloth. Experts are predicting that this new two-piece suit will be the popular summer style of 1939. (H. P. P.)

In the United States, the clothing industry also suffered severe financial reverses. Sales, and consequently production, fell off considerably. Increased production costs continued with renewed search for effort-saving devices the keynote. Great debate was held concerning the virtues and vices of the straight-line system as compared with the so-called bundle system. Generally, it was said that each system has its proper sphere; the straight-line where low cost is essential, where a variety of garments are not made and where labour is easily replaced. New machines appeared on the market: cloth-laying devices, cutting machines, blind stitch machines, pressing machines, and new, fast sewing machines. The slide fastener was taken up generally, on the wings of great consumer and manufacturer advertising. This was especially true of trousers and jackets; indications are for a renewed drive for slide fasteners on full-length coats.

Great demand for loose-fitting garments was the outstanding feature of the year. Bush coats and shirts were in demand. Sport shirts again were leaders. Indications of a trend toward peg-top trousers were evident with regular slacks still topping the field. Combination slacks and sport shirts of the same material were good sellers. In and out shirts and no-collar coats have made their presence felt. Interesting is the fact that the ensemble vogue has made trouser manufacturers out of shirt manufacturers, and vice versa, and at the same time driven the regular wear manufacturer to desperate straits.

Late in the year increased government regulation of the industry appeared in the hours and wages law and the new label rules for the woollen industry. Divided opinion greeted these measures as well as the Anglo-American trade treaty which lowered wool import duties. Political troubles abroad made themselves felt

The 1937 figure for all garments cut in the men's, young men's, and boys' industries (based on 72 per cent of value) was 281,365,267. It is indicated that 1938 will show a twenty per cent loss from these figures. (X.)

Ladies' Clothing. Sewing machines can now be found in almost all the remote villages and towns everywhere. In every country people make a large amount of their own clothing, but mass production tends to become more and more centralized.

For original model garments, Paris and London are the important centres; for bulk production, London, New York, and Berlin. Leeds and Manchester are increasingly important in the production of ladies' outer wear in the British Isles, and the quality of work and materials is very high.

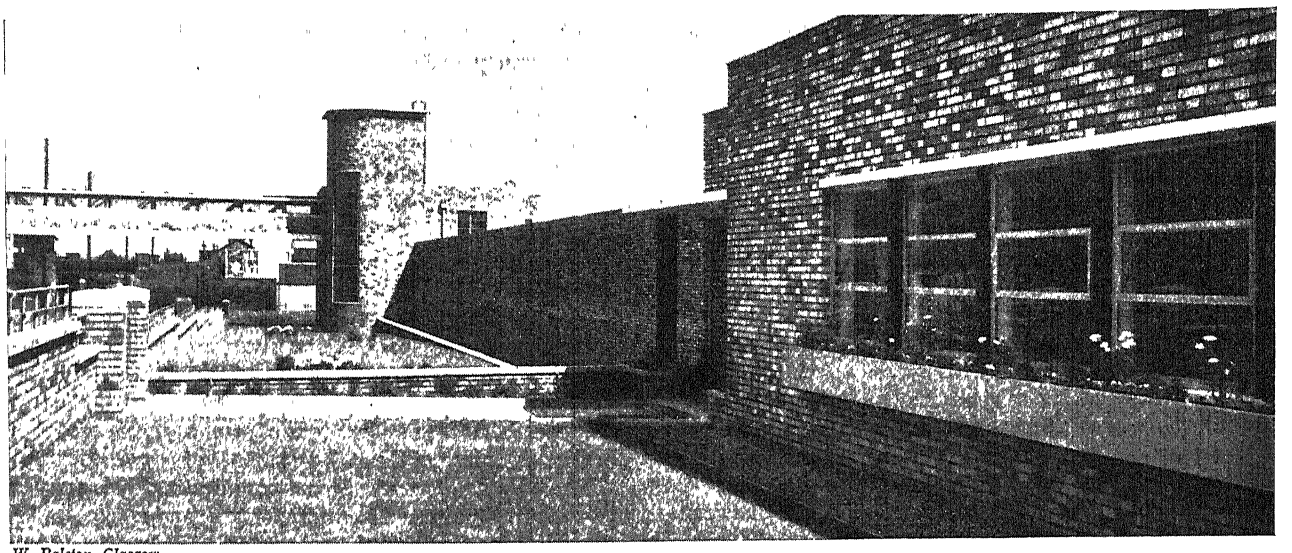
Efforts are being made to overcome the difficulty of stock sizes, and one large firm in Leeds produces as many as 55 different sizes. A closer study of sizes and a large and comprehensive range of different fittings are regarded by the trade as necessary to supply the public from stock without expensive alterations. The New York dress section of the trade has tackled the size question very well, but the same range of sizes is difficult to adapt to the requirements of the trade of other countries such as Great Britain.

The large variety of styles and materials required to meet the demands of changing fashion make the mass production of ladies' outer wear a most difficult matter. In certain sections of the trade, which is gradually becoming more mechanized, ingenious machines are continually being invented and adapted. An outstanding instance is a new quilting machine used to make a type of embroidery now very popular on ladies' coats (*see* FASHION). (G. H. W.)

COAL INDUSTRY. The estimated output of coal in Great Britain for 1938, namely 229 million tons, is 11 millions less than 1937. The decrease is due to a poorer demand for export and bunkers.

TABLE I

Year	Output, 000 Tons	Annual Change, 000 Tons
1929	258,000	—
1933	207,000	— 2,000
1936	228,000	+ 6,000
1937	240,000	+ 12,000
1938	229,000	— 11,000



In considering the above table, it must be remembered that the art of coal utilization has made great strides in the past decade, and that the use of fuel oil has increased greatly.

At a modern super-power station like Battersea the coal consumption is only 1·05 lb. of coal per electrical h.p. sent out, whereas in 1918 the figure would have been nearer 5 lb.

The increase of road transport has adversely affected the railways, who are also large consumers of coal.

Number Employed. The number of persons employed has shown a steady decline during the year, a decline that is comparable with the reduction in the demand for coal. The seasonal demand for house coal has not affected the number of employees as much as usual, owing to the autumn and early winter months being so mild.

The output per person employed has increased slightly in recent years, being between 23 and 24 cwt. per man shift. Any increase in the use of machinery has been offset by the

TABLE II

Production by Districts

	1929, 000 Tons	1933, 000 Tons	1937, 000 Tons	1938, 000 Tons
Northumberland	15,000	13,000	15,000	13,000
Durham	39,000	28,000	32,000	30,900
Yorkshire	46,000	37,000	44,000	42,000
Lancs, Cheshire, and North Wales	19,000	16,000	18,000	16,600
Derby, Notts, and Leicester	33,000	28,000	33,000	31,500
Staffs, Salop, Worcester, and Warwick	18,000	17,000	21,000	21,000
South Wales and Monmouth	48,000	34,000	36,000	35,000
Other English Districts	6,000	5,000	7,000	6,000
Scotland	34,000	20,000	34,000	32,000
Total	258,000	207,000	240,000	228,000

necessity for working thinner or more difficult seams. It must be remembered that the potential output of the coalfields is nearly half as much again as their actual output. This leads to short time being worked in all mines, and this is not conducive to efficiency.

TABLE III

Men at Work

End of	1937	1938
March	766,000	792,000
June†	778,000	786,000
September	780,000	773,000
December	780,000	770,000

Utilization of Output. The expansion of the heavy industries which became apparent in 1937 has been well maintained during 1938, and this is reflected in the continued good demand for home consumption.

There has been, however, a definite decline in the export trade, particularly to France, Belgium, and the Scandinavian countries, which is due to the continued decline in demand in these markets, accompanied by a fall in imports from all sources. In addition there has been an increase of restrictions on imports with France and Belgium as compared with the previous year. In the case of Italy, the demand was strong in the earlier months of the year, but declined later as it became necessary for Italy to maintain an equation between the value of coal imported and the sterling resources available.

No important new trade agreements were negotiated during the year, though amendments were made in one or two cases.

The question of a small levy on coal consumed at home in order to effect a subsidy on export coal has been under consideration, but no official steps have been taken to put it into effect. The threat of increasing competition from Germany and Poland has not caused any serious trouble during the year.

TABLE IV

Utilization of Output

	1913, 000 Tons	1933, 000 Tons	1937, 000 Tons	1938, 000 Tons

Total	60,263	39,068	40,000	35,877

Cost of Production and Profit per Ton. The average declared value per ton of coal sold during the year has risen from 15*s.* 11½*d.* to 17*s.* 3*d.*, and this rise is reflected in both the home and export market.

No major wage agreement has been negotiated during the year except one in the Lancashire and Cheshire district, which is to operate for one year from July 1, 1938. In many districts wages above the minimum rate have been paid during the year.

The average cash earnings per shift of all classes are estimated at 11*s.* 3*d.*, or sixpence more than in the preceding year, and during the year holidays-with-pay agreements have been concluded in most districts

There has been a continued rise in the price of colliery stores, particularly in pitwood and steel. The national armament programme has definitely increased the cost of production of coal in Great Britain.

The district selling schemes have continued to operate during the year with reasonable satisfaction, but no public action has yet been taken to co-ordinate the various districts; as a result coalfields close to the sea-coast have an advantage in the coastal trade over the inland districts.

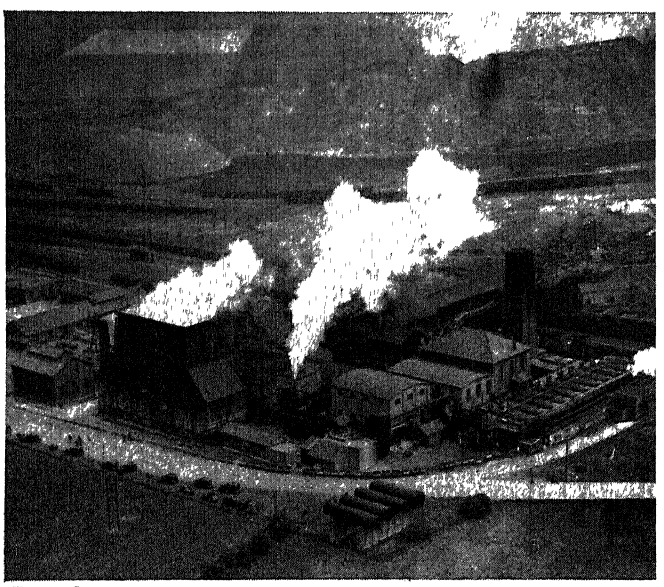

TABLE VI

Cost of Production and Proceeds per Ton of Coal Disposed of Commercially

	1937	1938
	s *d*	*s* *d.*

Credit Balance	1 1	1 3

Accidents. During the year the fatal accident rate has not altered materially from recent years, the death-rate being approximately 1 per 1,000 men employed, including underground and surface.

The accident rate per 100,000 man shifts worked above and below ground was 0·39 in 1936 and 0·43 in 1937.

Keystone]

MARKHAM COLLIERY, DERBYSHIRE, WHERE AN EXPLOSION ON MAY 10, 1938, KILLED 79 MEN

There has been one serious mining disaster during the year, namely the explosion at Markham Colliery, Derbyshire, which resulted in the loss of 79 lives. In addition, nine deaths were caused by an underground fire at Dumbreck Colliery, Stirling.

Safety in Coal Mines. Extensive use is being made of protective equipment in mines, at least 500,000 hard hats being in daily use. In addition to hard hats, special gloves, boots and shin protectors are being used in increasing quantities.

The condition of the haulage roads is being improved steadily, and over 3,000 miles of roadway, or 25 per cent of the whole, are protected by steel arches, while over 500,000 steel props are in use underground It has been estimated that more than 240 million tons of steel supports are in use in the coal mines of Great Britain.

The training of youths in matters affecting their safety is being actively pursued in most districts, and is expected to show positive results in the near future. It is a melancholy fact that many accidents underground are due to the workman's own carelessness or negligence.

General. There has been an increase in the number of pit-head baths erected during the year, and at the end of the year there were 131 in the process of erection or likely to be built shortly. These would provide extra accommodation for 140,000 men and 350 women. There are already in use 255 baths accommodating 330,700 persons. The cost is met largely by grants from the Miners' Welfare Fund, derived from a compulsory levy of ½*d.* per ton on all coal produced. Though the value of the pit-head bath was not realized by the mining population until recently, there is no doubt on the matter to-day.

One of the principal events of the year has been the publication of the report of the committee presided over by Lord Falmouth on Feb. 15, 1938, which examined among other things the question of the economic production of oil from coal.

The most important piece of legislation was the passing of the Coal Bill, which received the royal assent on July 29, 1938. The purpose of this bill is to provide for the unification of the coal royalties under public ownership.

Coke and Oil. During the year twenty million tons of coal were carbonized in 6,000 by-product ovens, the majority of which were of the regenerative type. During the same period nineteen million tons of coal were used in gas works. Some of the surplus gas from the by-product coke ovens, especially in the north of England, is sold direct to retail gas undertakings.

There has been a steady increase in the quantity of both light and heavy oils produced, the amounts in each case exceeding 100 million gallons. No success has, as yet, attended the attempts to find commercial quantities of natural oil in Great Britain. (J. A. S. R.)

United States. In the United States bituminous coal production has not yet recovered from the heavy decline which dropped the production rate by nearly one-half early in 1937; a gradual recovery in progress until near the end of the year was broken by the usual year-end decline. The high rate early in the year and the partial recovery resulted in a total output slightly greater (0·8 per cent) than that of 1936, at 442,455,000 short tons. Anthracite did not fare quite so well, and came out five per cent below 1936, at 51,856,000 tons. This gave a grand total of 494,311,000 tons, only 0·1 per cent above 1936. In 1938, the recovery from the year-end decline was broken at the end of January and production dropped regularly

until the end of March; throughout the entire second quarter production was at the low rate of about 2,500,000 tons weekly (bituminous only), gradually increasing during the third quarter, and averaging more than 4,000,000 tons weekly during the fourth quarter, up to the year-end decline Production for 1938 is reported at 342,407,000 tons, a drop of 23 per cent from 1937. The weekly production chart for anthracite during 1938 has much the appearance of a badly misused saw—a continuous series of ups and downs, with a tendency to sag in the middle, on the whole there were more downs than ups in the curve, for although the production rate at the end of the year was about the same as at the beginning, production for the year is reported at 45,054,000 tons, a drop of thirteen per cent from 1937. Total coal production for 1938 was then approximately 387,461,000 tons, or 22 per cent less than in 1937.

United States Production of Coal

(Millions of Short Tons)

	1929	1932	1935	1936	1937
Alabama	17·9	7 9	8 5	12·2	12 4

Tennessee	5·4	3·5	4·1	5·1	5 3
Utah	5·1	2·9	2·9	3·2	3·8
Virginia	12·7	7·7	9·7	11·7	13·6
West Virginia	138·5	85·6	99·2	117·9	118 1
Wyoming	6·7	4 2	5 2	5 8	5·9
Others	32·1	21·5	23·2	26·2	25·9
Total Bituminous	535·0	309·7	372·4	439·1	442·5
Anthracite	73·8	49·9	52·2	54·6	51 9
Grand Total	608·8	359·6	424·5	493·7	494·3

Considering coal as a whole, Pennsylvania is the foremost producing State, but eliminating anthracite and comparing only on a bituminous basis, Pennsylvania has lost the leading position, and West Virginia has taken its place. These two States alone produce more than half of the total bituminous output of the United States. Distributed by fields, about seventy per cent of the bituminous output comes from the Appalachian region (Pennsylvania, Ohio, West Virginia, Virginia, Eastern Kentucky, and Tennessee), twenty per cent from the Central region (Indiana, Illinois, Iowa, Missouri, and Kansas), six per cent from the Rocky Mountain and Western States, and three per cent from the Southern field (Alabama).

Although there is some international trade in coal, the amounts are so small that practically the United States industry is self-contained; imports are usually under 1,000,000 tons and exports have ranged from a high record of 24,000,000 tons in 1929 to a low record of 10,000,000 tons in 1932, including bunker coal and the coal equivalent of coke exported. (G. A. Ro.)

COAL: WORLD PRODUCTION. The reserves of coal, *i.e.* coal that can be worked at a profit, known in the world are approximately as under:

Anthracite	500,000 million tons
Bituminous	4,000,000 „ „
Lignite	8,000,000 „ „

In the larger coal-producing countries, the coal seams are mostly of carboniferous age, but vast quantities of lower-grade coal, such as lignite and brown coal, are available in Germany, Russia, Central Europe, and Asia.

The superficial extent of the coal areas of the world has been estimated at 605,000 square miles, or in the ratio of 1 to 110 of the land surface of the globe, about one-third belonging to formations newer than carboniferous. Coal is found in all latitudes between Spitzbergen and the Antarctic continent, and is of better quality as a whole in the Old World than in the New, also coal of the northern hemisphere is superior to that of the southern.[1]

Changes during 1938. During 1938 a redistribution of the coalfields has taken place in Central Europe owing to the absorption by the Reich of Austria and portions of Czechoslovakia The Austrian output of three million tons and the fourteen million tons of brown coal from the Falkenau and Elboger districts in Czechoslovakia are now controlled by Germany, while Poland has regained the Teschen area with an output of seven and a half million tons per annum As Austria has always had to import about three million tons of coal and coke, this redistribution of ownership will not materially affect the Continental situation, except to the extent that the output of the Teschen coalfield is not covered by the Anglo-Polish Trade Agreement at present in force.

The Anglo-German payment scheme, now covering the Austrian absorption, was renewed in July, a loan scheme to develop the Turkish minerals was completed during the year, and the possibility of an economic war in the Balkans is foreshadowed.

Principal Coalfields of the World. The United States is the largest producer of anthracite and bituminous coal in the world. Although the U.S.A. contains a larger amount of high-rank coal than any other country, its reserves of anthracite are relatively small. Bituminous coal is worked east of the Mississippi river, and low-grade lignites in the northern Great Plains and Gulf provinces, while comparatively little coal is found on the Pacific coast. The U.S.A. produces annually between 400 and 450 million tons, of which only some 11 million tons are exported, the majority going to Canada. The coalfields are all situated at a considerable distance from the shipping ports.

Germany. Germany, whose known coal reserves are the largest in Europe, is the world's second largest producer of coal, including lignite, and the largest producer of lignite itself. The bituminous coal districts of Germany are mainly in the Rhine provinces; the Saar district is close to the iron-ore deposits of Germany and France, the Rhine districts are in the heart of industrial Germany, while the output of Upper Silesia, the second most important field, is used both internally and for export. Lignite, which is extensively mined in Central Prussia, is dried before use and a large portion briqueted.

The German output is of the order of 350 million tons per annum, half of which is lignite, and 20 to 25 million tons is exported to France and other European continental countries.

The United Kingdom. The United Kingdom is the second largest producer of coal in Europe, and the largest exporter in the world. The coal is all of the highest quality, and the British anthracite, gas, and coking coals comprise the finest examples of their type in the world. The coalfields are distributed throughout the kingdom and in many cases are situated in close proximity to the shipping ports, which greatly assists the export trade.

The annual output of coal in Great Britain is some 230 million tons, of which forty million tons are exported, mostly

[1] Walcot Gibson: *Coal in Great Britain.*

to the continent of Europe and South America (*see* COAL INDUSTRY, Table V).

U.S.S.R. (*Russia*) The production of coal in the U.S.S.R. has shown an increase unparalleled among the world's larger coal producers. The largest producing coalfield is the Donetz basin, which is well equipped with railroads and is readily accessible to the Black Sea, and provides about 75 per cent of the coal mined in the U.S.S.R. An extensive lignite deposit is being developed south and west of Moscow to supply the industrial needs of that centre. One of the largest coal deposits in the world is situated in Central Siberia, the Kuznetsk basin, but it has not yet been developed to any great extent.

France. France, though a large producer, is short of coal and is therefore also a large importer. The most important coalfield is that of the Pas de Calais, centred round Valenciennes, Mons, and Lens. This coalfield was destroyed by the Germans in 1918, and as part of the reparation payment, the mines were re-equipped and are now modernized.

Poland. The main Polish coalfield borders on Silesia, and was ceded to Poland at the end of the War. The field has been extensively worked and by reason of the Polish Corridor and State-subsidized railways Polish coal has become a serious competitor to the older coal-exporting countries, especially in countries bordering on the Baltic Sea and in the Mediterranean.

Japan. Japan is a large consumer of coal, but is none too well provided with commercial deposits. There are, however, large deposits in Manchuria, especially at Fushun.

China. China possesses many coalfields, in fact one at least in every province, but as yet they have not been properly exploited.

South Africa. There are extensive coalfields in Natal, the Transvaal, and Southern Rhodesia. The Transvaal fields are in close proximity to the Witwatersrand goldfield. The Southern Rhodesian coalfield at Wankie has co-operated very materially in developing the copper-fields of Northern Rhodesia.

Australia. The more important coalfield in Australia is in New South Wales, and centres round Newcastle. A large lignite deposit is being worked in Victoria.

Coal Production of the World

(Including Lignite and Brown Coal)

Million Tons

	1929	1937	1938
United Kingdom	258·00	240·00	229·00
Germany	342·00	360·00	360·00
U.S.S.R.	40·30	121·00	125·00
France	55·00	43·00	42·00
Poland	46·00	35·00	33·00
Belgium	30·00	29·21	29·00
Netherlands	11·76	14·10	14·00
Czechoslovakia	39·00	34·92	27·00
U.S.A.	542·00	487·00	450·00
Canada	15·90	13·60	12·50
Australia	13·00	15·00	14·00
British Indies	24·00	22·21	22·00
Union of South Africa	13·10	15·25	16·00
Japan	34·00	45·00	45·00
China	15·00	14·00	?

Conclusion. It will be gathered from this short review that supplies of coal are available over a wide area of the earth's surface, but it will also be noted that the most progressive countries to-day are those possessing ample resources of coal which are being exploited. (J.A.S.R.)

COCHIN-CHINA: *see* FRENCH INDO-CHINA

COCOA. The Gold Coast farmers' "hold-up" of cocoa supplies lasting until April was the outstanding feature of 1938. An official report found the buying agreements, which provoked the hold-up, undesirable but improved marketing necessary.

Shipments from producing countries in 1938 totalled more than in 1937. The Gold Coast, Brazil, and St Domingo showed the chief increases and Nigeria the biggest decline. Trinidad exports increased, but French colonial shipments were almost unchanged. Imports declined heavily in 1938 for the United States, but increased for the chief European countries, notably the United Kingdom and the Netherlands. Visible stocks were reduced over the year in the United States, but increased substantially in the United Kingdom.

In Jan. 1938 the London price of good fermented Accra c.i.f. stood around 26*s.* a cwt., about half the price twelve months earlier. Some improvement occurred up to March, but the price dropped to 17*s.* 6*d.* at the end of May. A recovery thereafter was not fully maintained, and at the end of 1938 the price was about 21*s.* Movements for "fine cocoas" were similar.

The main crop estimates for 1938–39 indicate increases of about 10 per cent above 1937–38 for Brazil, 28,000 tons above the previous harvest for the Gold Coast, and little change in Nigeria. (J. L. C.)

COCONUTS: *see* VEGETABLE OILS AND ANIMAL FATS.

COFFEE. The quantity of coffee destroyed in Brazil from 1931 to Oct. 31, 1938, in the Brazilian government's coffee-marketing activities, was 84,444,000 centals. Of this 2,934,000 centals were destroyed in the first four months of the current 1938–39 season (July 1 to Oct. 31). Brazil's exportable coffee surplus for 1938–39 was reported by the International Institute of Agriculture as 31,315,000 centals, compared to 33,681,000 centals in 1937–38. The Colombian crop for 1938–39 was unofficially estimated at 4,250,000 bags of 60 kilos each. Coffee exports for the year ending June 30, 1938, are reported by the International Institute of Agriculture as follows, for principal producing countries: Brazil 1,934,056,000 lb.; Colombia 543,847,000 lb.; Netherlands Indies (Java and Madura) 190,046,000 lb.; Madagascar 70,817,000 lb.; Costa Rica 55,982,000 lb. and Haiti 50,341,000 lb. Compared with these figures the exports of the British Empire coffee-producing countries must seem but small: thus coffee exported from Kenya amounted to 26,883,000 lb.; India 16,405,000 lb.; Jamaica 8,375,000 lb.

Binks, Nairobi]

CUTTINGS SHOWING FLOWERS AND BERRIES OF A FOUR-YEAR-OLD COFFEE PLANT

and Aden 7,088,000 lb. Brazil had modified her export policy at the end of 1937, in view of the failure to arrive at an agreement for an international quota system. She had adopted the policy of competition, and reduction of the export tax and abolition of the official exchange quota had the effect of reducing her export price by 25 per cent. In the six months, January–June, 1938, shipments from Brazil increased by exactly this percentage, whereas those from other countries declined by nine per cent.

The principal coffee-importing countries, and the amount of their imports for the year ending June 30, 1938, were: United States 1,733,882,000 lb.; France 418,024,000 lb., Germany 400,425,000 lb., Belgium-Luxembourg 117,372,000 lb.; the Netherlands 101,631,000 lb., Sweden 105,716,000 lb.; Italy 76,516,000 lb., Denmark 61,551,000 lb., Finland 51,050,000 lb.; United Kingdom 50,795,000 lb. and Canada 41,050,000 lb. These figures once more reveal the extraordinarily low consumption of coffee per head in the United Kingdom, amounting as it does to less than one-twentieth of that in the Scandinavian countries. The year's end saw coffee shortages in both the totalitarian states. In Italy shopkeepers rationed their customers to ¼ lb. each, and the famine was even more acute in Germany. Germany's shortage was due to temporary difficulties over the barter agreement with Brazil, Italy's partly to the disorganization of trade caused by the government's creation of a monopoly company to handle coffee imports. (*See* also BRAZIL.)

COKE. The production of coke centres in the more heavily industrialized countries, particularly those with a large pig-iron output. World production, including both oven coke and gas-house coke, increased about eleven per cent in 1937, to an estimated 191,000,000 metric tons, the approximate distribution being: United States, 28 per cent; Germany, 25 per cent; United Kingdom, 15 per cent; U.S.S.R., 11 per cent; France, 5 per cent; Belgium, 3 per cent; Japanese Empire, 2 per cent; Netherlands, 2 per cent; Czechoslovakia, 2 per cent; India, Canada, Poland, and Italy, 5 per cent. Of the increased tonnage in 1937, the United States and Germany each contributed about 30 per cent and the United Kingdom 10 per cent.

The United States produced 52,362,000 short tons of oven coke in 1937, of which 94 per cent was by-product and six per cent beehive; this is an increase of thirteen per cent over 1936. Of the total, 65 per cent was used in the production of pig-iron and ferro-alloys. Production dropped heavily during 1938, the output for the first three-quarters being only 54 per cent of that for the corresponding period in 1937. Foreign trade plays a very little part in the industry, exports and imports each being of the order of one per cent of the output. Coke production took seventeen per cent of the bituminous coal production of the United States in 1937, apart from that used in gas works. Germany is the next largest producer of coke; in 1937 oven coke increased fourteen per cent to 14,894,000 metric tons; in addition, gas works coke is approximately 5,000,000 tons, and brown-coal coke 2,000,000 tons. Germany is a heavy exporter of coke, net exports in 1937 taking 20 per cent of the output.

Coke production increased six per cent in the United Kingdom in 1937, to 29,045,000 long tons; gas-house coke making up 45 per cent of the total, while by-product coke is 54 per cent, leaving one per cent for beehive ovens. Coke production consumed thirteen per cent of the bituminous coal output in 1937. Coke exports were 2,450,000 tons, or eight per cent of the total output. In Canada, in 1937 coke production used 3,577,000 short tons of coal, two-thirds of which was imported, in the making of 2,569,000 tons of coke; forty per cent of the output was used as domestic fuel, 35 per cent in smelting plants, and nine per cent in gas plants. In India, about 1,000,000 long tons of "soft coke" is made at the collieries, while "hard coke" production in 1937 was 1,867,000 long tons. The only other British Empire production of any magnitude is an output of about 1,500,000 tons in Australia, of which about sixty per cent is oven coke and forty per cent gas coke.

COLOMBIA, a republic in northern South America bordering both the Pacific and the Caribbean; language Spanish; capital, Bogotá; president, Eduardo Santos. Area 440,846 sq. m. Population (census 1928) 7,851,000 (official est. 1938), 8,698,634, the third largest in South America. A new census was taken in 1938, but is not yet released. Leading cities (1928 census): Bogotá, 235,421; Barranquilla, 139,974; Cali, 122,847; Medellín, 120,044; Cartagena, 92,491. Most of the population resides on the plateau; 30 per cent is urban.

Under constitutional amendment of May 25, 1938, the Congress meets once a year, instead of twice as formerly. The dominant political event of 1938 was the election (May 1), without formal opposition, of the Liberal candidate, Dr. Eduarto Santos, a leading newspaper editor of Bogotá and long a prominent figure in Colombian political life, to succeed President Alfonso López, who was constitutionally ineligible to succeed himself. The new president was inaugurated, Aug. 7, for a four-year term. Though somewhat less to the left than his predecessor, with whom he had differed on some policies, the new president gave no indication of major deviation from the López policies, except to pledge himself "not to use repressive measures to obtain social normality" in Colombia. The peaceful and orderly election and change of administration were in keeping with Colombia's record, unique in Hispanic America, of almost a third of a century of unbroken acquiescence in the verdict of the ballot-box.

Government education policies met with opposition when, on May 8, students in Bogotá, supported by the Conservative news organ, *El Siglo*, staged a protest strike against new requirements for matriculation in the universities. These, designed to raise academic standards and to force changes in curricula in parochial schools, had been the subject of bitter controversy on their enactment.

Important to the government's policy of furthering domestic ownership and nationalization of some industries, was the Supreme Court decision in May in favour of the government suit to collect a 2½ per cent "pipeline tax" on operating revenues of oil companies.

During November, an anti-Jewish campaign, largely supported by small merchants, was intensified in Bogotá and spread to other cities.

In October Colombia and the U.S.A. simultaneously raised their respective legations to embassies, and at the Pan-American conference (*q.v.*) at Lima co-operated closely in defence of democracy. On Nov. 28, a United States naval and military mission was sent to Colombia.

In July, Colombia formally announced intention to withdraw from the League of Nations. A sharp dispute with Germany broke out in December, when Berlin police detained the newly arrived Colombian minister because he photographed Nazi rioting against Jews. The minister was peremptorily withdrawn.

Education. In 1936 there were 8,459 primary schools

(enrolment 553,700), largely supported by the National Government, 438 secondary (enrolment, 31,122), about 80 per cent privately controlled, although Government aided; and two important national universities, at Bogotá and Medellín

Finance. The monetary unit is the peso (value: 2*s.* 6*d.*).

Trade and Communications. In May 1938, the last link of the Bogotá–Quito highway was opened Air transport service is quite important in internal communication, owing to the inadequacy of land routes from the coast to the main centres of population on the plateau There are 1,100 miles of railway, and approximately 500 miles of highway. The Magdalena river is an important artery of commerce.

In 1937, imports (largely textiles and other manufactured goods) totalled 167,770,000 pesos, with the United States leading (48·5 per cent), Great Britain second, and Germany declining to third. Exports were 182,991,000 pesos (besides 32,019,000 pesos value of gold), 15·9 per cent gain over 1936, with the United States taking 60·1 per cent. Purchases by Great Britain and Germany decreased; those of Belgium and Italy rose sharply. Coffee comprised 53·5 per cent of exports, petroleum 19·1 per cent, and bananas 3·8 per cent.

Agriculture and Minerals. In addition to the principal agricultural exports, Colombia produces sugar, wheat, cotton, cacao, and tobacco, largely for domestic consumption. The pastoral industry annually produces about 3 million pesos value of hides for export Colombia ranks ninth in world petroleum production (estimated production in 1938: 21,315,000 barrels), second in platinum, and first in emeralds. Gold is mined in considerable quantity. Manufacturing for domestic consumption has advanced under the protective tariff policy, and employs 300,000 persons. (L. W. Be; X.)

COLONIAL POLICIES. While economic considerations may be said to remain of first importance in colonial policy, since the adoption of the Covenant of the League of Nations in 1919, involving the principle of trusteeship for backward peoples, colonial development has been characterized by a widespread effort to reform the administration of native affairs and to improve the economic and social conditions of the native peoples. There are, however, considerable differences in the policies adopted by the colonial powers in carrying out these objectives.

Events in the West Indian and in other colonies have given occasion for a public discussion regarding the adequacy of the British system of control through the Colonial Office. Lord Hailey, in *An African Survey*, dismisses the suggestion for the establishment of a Colonial Council as alien to British ideals of parliamentary control, and suggests the institution of a Standing Colonial Committee of the Houses of Parliament.

British colonial policy of to-day looks to government through parliamentary institutions as the political future of its colonies, and encourages the devolution of a large measure of authority to the colonial governments. But in colonies where self-government would involve either the predominance of a European minority or the ultimate political supremacy of a native majority, difficulties stand in the way of its complete realization, and a compromise is sought by the creation of legislative bodies, with nominated or elected non-official members and an official majority, and by the development of local self-government among the tribal authorities. The acceptance of the principle that native institutions are themselves of value as agencies of government, and can be brought into agreement with civilized conceptions, was elaborated in a series of political memoranda by Lord Lugard in the early part of this century. This system, known as indirect rule, has been adopted with success in Africa and forms the basis of native administration in Malaya, local native administrations with both executive and judicial functions now administer the affairs of the native people under the guidance of the British officials. The future of the system depends both on its powers of adaptation to the strain of local government as social services expand and to the growth of native political and national aspirations. Its future relation to parliamentary government is obscure, and it is significant that in advanced native communities political interest centres on the municipal and legislative councils rather than on tribal self-government

British policy in countries where backward native peoples form a majority of the inhabitants may be contrasted with the policy of native administration in the Union of South Africa and in Southern Rhodesia. In the Union the main objective of policy is the preservation of the social and economic standards of European civilization. The native people are relegated to a separate and subordinate sphere, and are provided with their own system of representative government, culminating in a consultative body, the natives' representative councils. In Southern Rhodesia policy is in the same direction In both countries it is accompanied by comprehensive measures for the social and economic improvement of the native areas in which the main body of the native people are to be segregated.

French policy aims at the close economic and political association of the colonies with the mother country. An early colonial doctrine of "assimilation", which envisaged the wide admission of the native people to French citizenship, has given way to a policy aiming at the progressive spread of French culture and the close association of the people with the French administration. The indigenous chiefs are used as agents of the government, and education is directed towards the production of an *élite* who will, under French direction, take their part in the social and economic development of their country. These political aims are closely allied to a policy of *mise en valeur* which has the dual aim of fostering local prosperity and enriching the mother country Citizens of all races vote in the election of deputies who represent the colonies in the Paris Chamber; to-day, however, the numbers of admissions to French citizenship are restricted. The ministry for the colonies exercises a close control of policy through visiting commissioners, and legislation is mainly through ministerial decree; the government of the colonies is thus highly centralized. A system of consultative councils on the French model, on which natives are largely represented, assist in local administration and provide scope for the political ambitions of educated natives.

Belgian policy forms a strong contrast to the excesses of the Congo Free State. While economic development through both government and private agencies is widely encouraged, the rights of the natives are carefully protected in a Colonial Constitution, and by means of a permanent Commission for the Protection of Natives. A Colonial Council advises the minister for the colonies and exercises control over legislation and administration. A system of indirect rule, giving existing tribal authorities a measure of self-rule, is being developed throughout the Congo and Ruanda Urundi

Portuguese colonial policy has been infused with new

vigour. The Organic Charter and the Overseas Administrative Reform, under the Salazar regime, introduced in 1933, lay down the general principles of a liberal native policy aimed at the encouragement of local government through the recognized tribal authorities, the protection of native lands, and the abolition of enforced labour. Among other colonial powers, the Netherlands have since 1925 granted a measure of self-government to their colonies, and where possible have adopted a system of indirect rule which approximates to that in British colonies, but the colonial territories remain closely bound to the mother country by economic and political ties.

Although there is a wide divergence in the principles underlying the colonial policies of the various powers, all are faced with the same task of fulfilling the two aims of what Lord Lugard has described as the "dual mandate"; they must allay the dissatisfaction of the subject peoples shown in riots and risings by offering a fair return for the obligations they impose, and allow a reasonable outlet for a growing desire for social and economic improvement; they must administer colonial resources in the general interest if they are to prove to other powers that their policy is not one of selfish exploitation.

COMMUNITY CENTRES AND CLUBS. The great increase of clubs and community work which has taken place and is still taking place in Great Britain is largely due to the work of three organizations · the National Association of Boys' Clubs, the National Council of Girls' Clubs, and the National Council of Social Service. These three organizations owe much of their strength, if not their very existence, to the far-sighted and generous assistance of the Carnegie United Kingdom Trustees and the personal interest of Their Majesties the King and Queen, H.R.H. the Duke of Gloucester, H.R.H. the Duke of Windsor (when Prince of Wales), and other members of the Royal Family. They are now being further strengthened by the co-operation of local authorities and the work of the National Fitness Council. In their distinctive but allied spheres the Y.M.C.A. and Y.W.C.A. (*qq.v.*) have a fine record of achievement.

The main purpose of clubs may be summarized as to provide for the constructive use of leisure. The overwhelming majority of boys and girls of Great Britain leave school at fourteen (to be raised from Sept. 1, 1939, with exemption in approved cases, to fifteen). The four or five years which intervene before maturity are years of immense potential development, which influence and largely decide the habits, interests, physique, and character which will be permanent in maturity. There is appalling wastage and loss to the community if boys and girls do not have the opportunity for this development which their employment and home circumstances seldom provide. A good club can and does fill the gaps; boys and girls can be attracted, in the first place, by games and recreation, but they must be held by something far stronger. This impulse is found by utilizing the instinct for comradeship in order to create a society which will evoke the loyalty of its members. In membership of such a self-governing society as a club the boy or girl finds a healthy pride, an objective to serve and an opportunity for achievement, but more than that he or she experiences a fellowship which, however much it may have been besmirched by false sentiment, remains one of the foundations of the ideal community and an incentive to worthy action. The success of the method may be shown by the very high standards reached by clubs in physical training, sport, handicrafts, and drama, the most successful clubs being often those whose members are drawn from the poorest homes.

The Builder]
WELWYN GARDEN CITY COMMUNITY CENTRE

The following figures give some account of the scope of the movement:

The National Association of Boys' Clubs, 17, Bedford Square, London, W.C.1, has 1,600 affiliated clubs, with a membership of 145,000 boys, approximately 80 per cent of whom are between fourteen and eighteen. There are fifteen County Associations and fourteen City Federations of Boys' Clubs. These figures take no account of the many clubs which are unaffiliated either because they do not reach the minimum standard or for other reasons.

The National Council of Girls' Clubs, Hamilton House, Bidborough Street, London, W.C.2, has, with its associated organizations, the Association of County Clubs, the British Home Fire Girls, the Girls' Friendly Society, the National Home Fire Girls' Association, and its 55 local Unions, a total membership of approximately 202,000. The majority of the members are between 14 and 25.

The Community Centres and Associations Committee, which has taken the lead in the promotion of community centres, works under the ægis of the National Council of Social Service, 26, Bedford Square, London, W.C.1. There are now upwards of 140 Community Associations concerned with the development and co-ordination of all kinds of community efforts. The Slough Social Centre, one of the most interesting experiments, differs from other centres in seeking to promote the community spirit by uniting those who use the Centre in membership of the Central Club. Further, by providing adequate accommodation for youth, it has avoided the mistakes made elsewhere.

It has been possible here to summarize only very briefly the principles and methods of the movements. More detailed information may be had from the literature published by the Associations mentioned above. (E. F. P.)

CONGO: *see* BELGIAN CONGO; FRENCH EQUATORIAL AFRICA.

CONGREGATIONAL CHURCHES. The most notable event in British Congregationalism during 1938 was the removal of the accumulated deficit of £76,000 on the

London Missionary Society—the Society supported by Congregational Churches throughout the Empire. In addition, promises have been made amounting to an extra income of between £15,000 and £20,000 a year

The Rev. J Ernest James, B D , of Allen Street, Kensington, was elected to succeed the Rev R. W Thompson, M.A , B D., of Bristol, as chairman of the Congregational Union of England and Wales. The Rev. J. G Drummond and the Rev. J McKane were elected chairmen of the Scottish and Irish Unions respectively, and Principal J. Morgan Jones chairman of the Welsh Union of Independents

English Congregationalism has under consideration a scheme for dealing with the problem of ministerial settlements and removals and also a proposed new hymn book, the present one, the *Congregational Hymnary*, dating from 1916.

The Rev H F. Lovell-Cocks has succeeded Dr. T Hywel Hughes as Principal of Edinburgh College, and the Rev T. S. Taylor Dr. A R. Henderson at Nottingham.

In Canada the Congregational Churches are now merged with the Methodists and most of the Presbyterians in the United Church of Canada. In South Africa and Australia attention has been given to the question of Church Union, especially with these two denominations. In New Zealand negotiations have been suspended. In India the South India United Church scheme has been under discussion by the different parties concerned—Anglican, Methodist, and the already United Church (Presbyterian and Congregational). In Newfoundland the churches have felt the full blast of the economic situation, while the same also applies to the West Indies. (A. P.)

United States. The Congregational churches have a membership of 1,030,914, organized into 6,109 congregations. During 1938, these churches received 58,490 new members, an increase of about 3,000 over the number of new members received the preceding year. Pension funds have been enlarged so that all pastors reaching the age of 65 may retire on an adequate pension, and this plan is being extended to include the lay workers of the denomination. The Congregational churches are developing a new interest in public worship, in the re-establishing of historic forms, and the observance of the traditional Christian year. The Lenten season and Advent, which received hardly any notice in most of these churches twenty years ago, are now recognized as worthy features of the church programme.

The foreign work of the churches, administered by the American Board of Commissioners for Foreign Missions, has been under unusual handicaps due to war conditions in China and Japan. But in spite of great hardships the missionaries have remained at their stations and have helped the refugees to the limit of their resources.

CONGRESS OF INDUSTRIAL ORGANIZATIONS, a federation of labour unions in the United States and Canada, of which John L. Lewis, president of the United Mine Workers, is president. Formed on Nov. 9, 1935, as the Committee for Industrial Organization, the committee held its first constitutional convention in Pittsburgh on Nov. 14–18, 1938, changed its name, adopted a constitution, named Mr. Lewis president, Philip Murray and Sidney Hillman vice-presidents, and James E. Carey secretary.

The first objective of the C.I.O. was to organize the employees in the mass-production industries, such as steel, automobiles, and textiles, into industrial unions. It took over three weak American Federation of Labor unions in those fields, and started an intensive organization campaign in the autumn of 1936. Two years later the C.I.O. reported that the membership of the Amalgamated Association of Iron, Steel, and Tin Workers had grown from approximately 10,000 to more than 525,000 ; the United Automobile Workers from 30,000 to 381,000, and the textile union from 25,000 to 450,000. (*See* also AMERICAN FEDERATION OF LABOR ; STRIKES AND LOCKOUTS.)

CONNAUGHT, PRINCE ARTHUR OF, was born at Windsor on Jan. 13, 1883, and died in London on Sept. 12, 1938. He was the only son of the Duke of Connaught, and therefore was first cousin to King George V. He was educated at Eton, whence he proceeded to Sandhurst, and in 1901 was commissioned to the 7th Hussars. His association with the Royal Scots Greys, of which he was made Colonel-in-Chief in 1921, began in 1907. He served in the South African War and throughout the World War, in which he was extra A.D.C. successively to Sir John French, Sir Douglas Haig, and Sir Charles Monro. He was twice mentioned in dispatches, and in 1915 was made a C.B. He retired from the army in 1919.

In 1906 the Prince went to Japan to invest the Emperor Mutsukito with the Garter. He again went to Japan in 1912 and 1918. After the accession of George V he continued to perform many public duties while the King's sons were too young to do so. He was one of the Counsellors of State during the King's Durbar tour in India in 1911–12. In 1913 Prince Arthur married the Duchess of Fife, daughter of the Princess Royal. From 1920 to 1923 he was Governor-General of the Union of South Africa. The Prince was created K.G. in 1902, G.C.V.O. in 1899, and G.C.M.G. in 1918 ; and since 1936 he had been personal A.D.C. to the King. He is succeeded by his son, the Earl of Macduff.

CONSERVATIVE PARTY, THE. During 1938 the policy of the National Government in Great Britain, to which the Conservative Party of course subscribes, has undergone no outward change. This policy was thus enunciated by the prime minister on assuming office : (1) to keep the peace ; (2) to make Britain so strong that nobody shall treat her with anything but respect ; (3) to maintain and increase the prosperity and activity of trade and employment ; (4) to carry on the improvement of the condition of the people.

The year 1938 has seen the application of this policy to situations of unusual complexity both at home and abroad ; these in their turn have revealed acute differences within the party. One may perhaps account for these by relating them to one central problem, the difficulty of reconciling traditional Conservative opinion with the vagueness and flexibility of a National Government, seeking by " Highest Common Factors " to unify the partly disparate aims of the Liberal and Labour element with those of the Conservative majority. Though these discords and conflicts increased in violence throughout the year, they did not culminate in active revolt : the process, furthermore, was not accompanied by any marked transfer of popular allegiance to the opposition. Each of the four main points of government policy contributed to this division of views.

(1) " *To keep the peace* ". With inexhaustible energy and steadfastness Mr Chamberlain has insisted on a foreign policy based on active appeasement. A sick and mutilated League of Nations could only regain health and authority if it were not overloaded with tasks beyond its strength. European peace could yet be maintained if nations would consent, under British tutelage, to break away from the fatal vicious circle of distrust and hostile alignments, by a resolute attempt to understand and sympathize with each other's problems. Meanwhile, in view of existing weakness, alike of collective security and of imperial defence, British

diplomacy must "go slow". Personal contacts were the surest prelude to the written agreement. So by the close of the year the prime minister was able to point to successive treaties with Italy, Eire, Germany, and the U S A Conservative opinion would fain applaud this policy and echo the hope that inspires it. Yet a large and growing body of opinion agrees with Mr. Eden and others in opposing a militant realism (the "forward policy" of Palmerston or Disraeli) to the Gladstonian romanticism of the prime minister. It has seemed impossible to reconcile appeasement to the "stand and deliver" tactics of the totalitarian states. To "go slow" seems to commit Great Britain to a "policy of scuttle" a series of rearguard actions dragging her prestige ever downward to the precipice edge. Throughout the year the pendulum swayed to and fro—impending revolt forever being arrested by the "symbolic figure" of the prime minister.

(2) "*Strength through rearmament*". Nowadays the defensive security of Great Britain is an imperial problem, in view of the ultimate dependence of the entire Commonwealth on the mother country. Thus a co-ordinated system of long range planning, spatial and temporal, finds equal expression in the government's decision to carry out a system of compulsory national registration in the event of war; the decentralization of imperial defence; the correlation of Britain's defensive policy with that of France; and the co ordination of industry. Can Great Britain, by exerting herself to the utmost along lines of voluntary co-operation, belatedly overhaul the superior efficiency of the totalitarian powers? Again, extremist Conservative opinion, led by Mr. Churchill, has strenuously attacked the government's defence programme as inadequate: alike in its failure to anticipate a critical emergency by adequate provision of economic resources; its slowness in developing air-raid defence; the insufficiency of Air Force expansion, and its helplessness in coping with the individualism of industry. In these terms the crisis provided in retrospect some doubts of the government's administrative capacity, and some Conservative suspicion of the survival of the traditional Tory indolence that prefers decentralization and impromptu effort, with all its wasteful inefficiency.

(3) and (4) "*The development of trade activity and social amelioration*". Conservative opinion accepts, in part with approval, in part with great reluctance, a policy which would assist staple industries and agriculture alike by a cautious paternalism that would leave unimpaired the initiative of each interest involved. Such a "Highest Common Factor" creed stands half way between the extremes of Free Trade and of economic nationalism. Conservative opinion of the old order still favours the latter, and hopes to be able to construe trade difficulties in terms of a campaign for whole-hog Protection. Thus Coal and Farming have expressed in the past year their dissatisfaction with government policy. Though individualist competition had brought a large section of the coal industry to the verge of suicide, the Coal Act, providing for compulsory regional amalgamation and the purchase of royalties, met with extremist opposition. Again, certain branches of British agriculture still anticipate a type of government assistance which will yet not interfere with their liberty of action. While £40 millions are being spent annually in direct assistance, a farmer will chafe at the dubious benefits of market reorganization, restricting quotas, and other forms of bracing regimentation. Forgetful of the direct dependence of agriculture on industrial prosperity (in its turn conditional on an equitable interchange with good friends and customers abroad), the militant Tory still hopes to thwart the Free Trade majority in the Party by an ever-widening wedge of Protection (T. S.)

CONTRACT BRIDGE. Conservative estimates for 1938, based on government sales of playing cards, bridge book sales, etc, placed the number of players in the United States and Great Britain alone at between 15,000,000 and 18,000,000. Of this number, more than ninety per cent played the Culbertson system; the remainder being split up among several variations of the basic system.

During the early part of the year, considerable flurry was caused by the introduction of "Five-Suit Bridge", but this innovation proved short-lived Originating in Vienna, this type of bridge, based on packs containing five suits, received its greatest impetus in England when the King and Queen visited a bazaar and bought the new packs. This incident, widely reported by American newspapers and magazines, led to the game's being taken up by experimentally-minded Americans, but the fad lasted less than two months. Thus, Ely Culbertson's early observation that "the average player had not yet thoroughly learned how to play with four suits, let alone with five suits" proved prophetic.

The consolidation (in late 1937) of the two rival bridge associations (American Bridge League and United States Bridge Association) into one powerful governing body (American Contract Bridge League) had its expected result · tournaments flourished in every part of the United States. The annual World Bridge Olympic, held on April 20, enjoyed unprecedented success, with 192,452 players, participating in 57 different countries

The International Bridge League held its annual tournament in Oslo. Teams representing eleven European countries participated. Hungary was the victor. It was voted to hold the 1939 World Tournament in New York, to coincide with the New York World's Fair.

Perhaps the greatest single influence during 1938 for creating new players and improving experienced ones was a device known as "Autobridge". This invention reproduces actual playing conditions, and makes it possible for one person to take a hand against two experts, and with one expert partner, to play perfectly, automatically.

The few changes in the Culbertson system during 1938 affected, primarily, the opening three-bid. Heretofore, such opening bids were either strong or weak bids, the true nature of which was not made known until succeeding rounds of bidding. The new requirements were put as follows:

For a major suit three-bid, a trump suit at least six cards long with no more than one loser in the suit and no more than one-plus honour-trick outside the trump suit; total playing-tricks of hand between six and 7½. For a minor suit three-bid, an absolutely solid suit of six or seven cards with same general specifications (six or 7½ total winners in the hand).

The second change in the system was to put the two following bidding sequences on identical bases:

1. East	South	2. East	South
1 ♡	2 ♤	2 ♤	3 ♡ or 3 ♢ or 3 ♧

As always, South's two-spade bid in sequence 1 remained a strong bid asking for a light raise. Now, South's three-heart, three-diamond, or three-club overcall in sequence 2 means precisely the same as the two-spade bid in sequence 1, *i.e.* a strong hand (though not necessarily a solid suit) inviting a light raise. Besides these two minor revisions, there was one addition to the Culbertson system. This

involved a forcing bid by the partner of an overcaller. In such a sequence as East, one club ; South, one heart ; West, pass ; North, two spades, North's two-spade bid (a single jump response) is forcing for one round. This, according to Ely Culbertson, makes it much easier for the so-called defending side to reach game after the bidding has been opened by the opponents

In late 1938, leaders in contract bridge (notably Ely Culbertson and William E McKenney, secretary of the A.C.B L) publicly voiced the proposal that contract bridge scoring be changed, so that the minor suits (diamonds and clubs) would be on an equal basis with the major suits, in so far as scoring value is concerned ; and that with this change, a " sub-slam " should be put into the game. With all suits on an equal basis and with the possibility of making game at four-odd in diamonds and clubs as well as in spades and hearts, the five-level of bidding would be left free for this sub-slam idea and, thus, accurate bidders could earn a bonus (200 or 300 points) for risking a game, to contract for and fulfil a sub-slam at the five-level. According to agreement made between all law-making bodies in 1935, no changes in the rules or scoring can be undertaken until 1940, but it is very probable that the mentioned proposals will receive attention of a preliminary committee in late 1939, and that they will be adopted in 1940. It is known that many players favour these changes. (E. CUL.)

CO-OPERATIVE MOVEMENT. The Co-operative movement substantially increased its share of the national retail trade during 1937. Official statistics show 1,100 distributive societies with 8,085,000 members (increase 277,000 or 3½ per cent), sterling turnover £251,393,047 (increase £17,548,697 or 7½ per cent), share and loan capital of £100 millions (increase proportionate). These figures will certainly be exceeded in 1938, as increases were visible up to August and greatly outweighed subsequent small declines. Thus 1938 will substantially exceed the previous sterling record turnover of 1920, £254,158,144, when war-time price levels prevailed. Contrast between 1920 and 1938 can best be measured by the number of employees, namely, 201,509 in 1920 and 335,705 in 1938, despite rationalization.

The turnover of the four wholesale societies in the last completed year, £151,270,000, represented a substantial advance, and provided employment for 73,000 workers in distributive, productive, and transport services. The Co-operative Insurance Society now has a premium income of £8,415,600 as against £7,694,000 in 1936. A number of expansions in productive capacity have been made and as in recent years, milk treatment and distribution shows a big trading development. There are, however, still difficulties in regard to overlapping of functions and trading areas in both retail distribution and production, and attempts to deal with these handicaps radically have, so far, failed to command any measure of the support necessary in voluntary federations, the units of which enjoy full statutory autonomy.

Economic self-examination was an important feature of 1938, when the economic survey of retail services was completed and approved by the Co-operative Congress. It revealed, *inter alia*, the total number of co-operative shops as 24,000, far higher than had been believed. The results showed that co-operative retailing is increasing more quickly than that of the total retail trade of the country. Some departments are doing better than others. Grocery is virtually stationary. Dairy work, on the other hand, is expanding rapidly, and accounts now for about £20 millions per annum. The survey recommends amalgamation of societies where necessary to secure economies of service.

Relations between the Co-operative Party and the Labour Party, previously cordial, were not so happy last year, the Co-operative movement preferring free association with, rather than close affiliation to, the Labour Party. (E. T.)

COORG. This tiny Indian province (area 1,593 sq. miles ; pop. 163,327) has not yet reached the dignity of autonomy, the resident at Mysore (Col J. H. Gordon) being *ex officio* its chief executive and judicial authority. Coffee is its best known product , rice and forest-timbers come next in importance.

COPELAND, ROYAL SAMUEL, United States Senator, was born in Dexter, Mich., on Nov. 7, 1868, and died at Washington on June 17, 1938 Though he came from the same state as President Roosevelt and belonged to the same political party, he was one of the bitterest critics of the " New Deal " policies. He began his career as a doctor, specializing in ophthalmology, and taught his speciality in Michigan and later in New York, where he migrated in 1908. Closely associated with Tammany Hall, the New York Democratic party organization, he was appointed Commissioner of Health for New York City in 1918, and was Democratic Senator for New York State from 1923 on. In 1937 he entered as Tammany candidate for the Mayoralty, but was crushingly defeated in the primary elections both of the Democratic and Republican parties, one of the worst reverses Tammany has ever suffered.

COPPER. Nine copper-producing countries with outputs, present or past, in excess of 50,000 tons accounted for ninety per cent of the world total in 1929 and 89 per cent in 1936, which is only a comparatively small change, but in the meantime there has been a radical change in the status of many of the individual producers. World output as a whole decreased by 53 per cent between 1929 and 1932, increasing by 1937 to 118 per cent of the 1929 high level ; of this total, production outside the United States dropped only 26 per cent and recovered to 53 per cent above 1929, while the United States output declined by 75 per cent and recovered to only 82 per cent of the former high level ; as a result, the United States proportion of the total has decreased from 49 per cent to 33 per cent. The United States still retains the position of leading producer, followed by Chile with eighteen per cent, Canada ten per cent, Rhodesia ten per cent, Belgian Congo seven per cent, Soviet Union four per cent, Japan three per cent, and Peru and Mexico each two per cent. All major countries except the United States, Mexico, and Peru, and many of the minor ones, were well above the 1929 level in 1937.

World Production of Copper

Exc. U.S. .	990·5	673·7	1,114·7	1,120·0	1,511·4

Rearmament activities were largely responsible for heavy increases in production in 1937, to a world output of 2,273,000 metric tons, an increase of 26 per cent over 1936.

The chief countries contributing to this increase were: Chile 61 per cent; Congo 57 per cent; Rhodesia 52 per cent; United States 37 per cent; and Canada 24 per cent. Production in the United States began to decline in September, continuing to July 1938, since when there has been marked improvement, but not to the level of the 1937 average, with the result that the output for 1938 is estimated at 34 per cent less than in 1937, or approximately 500,000 tons Production outside the United States declined slightly in 1938, chiefly in the first and third quarters, but with a marked pick-up in the fourth quarter, which cut the drop for the year to about four per cent, for an output estimated at 1,450,000 tons This gives an estimated world total of 1,950,000 tons, a decrease of fourteen per cent from 1937 Canada and the Soviet Union, among the major producers, and Yugoslavia and Australia among the minors, seem to have had increased production in 1938, while most of the others had decreases, Japanese smelter output was higher, but it is not yet known how much of this was from domestic and how much from imported ores During most of 1938, deliveries have exceeded output, and by November stocks had been reduced by about 45,000 tons During 1938 the international copper cartel made three changes in production quotas, from Dec 1, 1937, to July 1, 1938, the operating rate was set at 105 per cent; to Oct. 15, at 95 per cent, then reverting to 105 per cent, but on Oct. 17 all restrictions were removed, retroactive to Oct. 15 The members of the cartel supply about 75 per cent of the world total, and the percentage figures on which quotas are based refer to the operating rate at the time the cartel was formed and not to the actual capacity of the plants, which is about fifty per cent greater.

All the countries listed in the table, with the exception of the United States, Japan, and the Soviet Union, are comparatively small consumers of copper, and hence produce mainly for export. The chief copper-consuming countries, in order of importance, are the United States, the United Kingdom, Germany, the Soviet Union, Japan, and France, which cover nearly ninety per cent of the total consumption The United States is the only major consumer with an export surplus; all others are dependent on imports for a large proportion of their supply. In spite of the fact that on the average 22 per cent of the output is exported, consumption of copper in the United States far exceeds the new copper supply, the remainder coming from secondary metal recovered from previous use, a source which yielded a larger amount of copper during the depression years than was obtained from the primary production.

The United Kingdom, the second largest consumer, has only a nominal output of a few thousand tons, and secures practically its entire supply from imports, a growing amount of which is re-exported. Most of the imports are from Empire sources, though the United States and Chile furnish appreciable amounts. Ore and matte make up only about ten per cent of the imports, the remainder being divided in about equal proportions between rough copper and electrolytic. German refineries are now producing about 225,000 tons annually, about 85 per cent of which comes from imports, seventy per cent as metal, and fifteen per cent in ore; exports are negligibly small. Russian production supplies about two-thirds of the demand, and imports one-third, while in Japan production is slightly less and imports are proportionately higher. France has practically no domestic output, and imports almost the entire supply. (*See* also METALLURGY; MINERAL AND METAL PRICES.) (G. A. Ro.)

COSTA RICA, a Central American republic, capital, San José (pop. 45,000), president, León Cortés; area, 23,000 sq. m., population (1936 estimate), 578,040. Throughout 1938 Costa Rica's boundary dispute with Panama was active. A boundary treaty signed Sept. 26 met such violent popular protest that in October it was withdrawn unratified In November strong measures were taken to eliminate the "unfavourable" trade balances of Italy and Japan. Road construction, especially of the Pan-American highway, received strong stimulus during 1938 In 1937, imports increased 41·5 per cent to $11,878,547, principally from the United States and Germany; exports were $11,512,097 (a 38·5 per cent increase), to the United States, Great Britain, and Germany. Coffee and bananas are the mainstays of Costa Rican economy. Further development of the banana industry was promised in 1938 with the grant of a 50-year concession for cultivation of 6,880 acres on the Pacific coast. Cacao is also important. The monetary unit is the colon (value . 9d.). The budget for 1937 was 32,597,873 colones. (L. W. BE.)

COST OF LIVING. The upward trend of the cost of living characteristic of almost the entire world after 1933 continued into 1937–38, but only in France and Norway (excluding war areas) did 1937–38 indexes of food prices go higher than in 1929. In most nations 1937–38 food prices were higher than 1936; but the official indexes of Germany, Austria, and South Africa show very little change The increases ranged around five points in the United States, Great Britain, Australia, Bulgaria, Estonia, Hungary, Ireland, Netherlands, Poland, and Sweden, and were definitely below 5 per cent in Canada, Australia, and Czechoslovakia. But Great Britain, Finland, Belgium, Norway, and Switzerland experienced almost a 10 per cent increase in food prices in 1937–38. During the first half of 1938 cost of living stabilized at approximately the 1937 levels in most of the nations. In France there was a slight increase and in Sweden a slight drop in living costs by midsummer of 1938. The food costs index for the United States stood at 78·7, Sept. 13, 1937, and 85·8 a year earlier.

The inclusion of rent, clothing, fuel, and sundries in a cost of living index tends to increase its stability as compared with an index based upon food prices only. The latter fluctuate faster and more sharply. This is apparent when the British, Canadian, and American indexes are examined. The accompanying table includes a varied assortment of items and not merely food costs.

The detailed figures of the United States, Canada, and the United Kingdom reveal that the trends of prices of different foods varied considerably both during 1937 and 1938. In the United States, meats were 13·2 per cent lower in Sept. 1938 than Sept. 1937; dairy products, 6·7 per cent lower; and eggs 3 per cent higher.

The accompanying table shows the relative trends of retail food prices in eleven countries from 1929 up to June 1938. The figures have been recalculated by the International Labor Office on a 1929 base, and this table cannot be compared directly with the table published for 1937 and previous years. (*See* also PRICES, STATISTICS OF; PURCHASING POWER OF MONEY.)

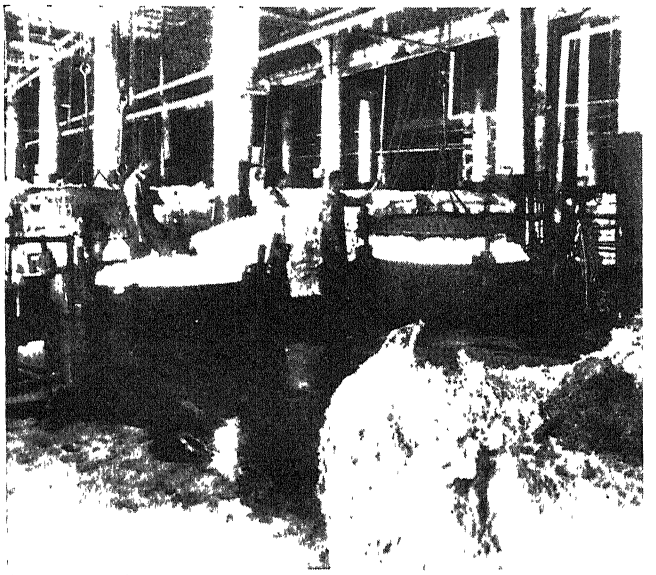
COTTON AND COTTON MANUFACTURE. The world supply of cotton for the current cotton-crop year of 1938–39 (Aug. 1, 1938, to July 31, 1939) was estimated at approximately 50,775,000 bales. This is slightly larger than the preceding year, and marks the third consecutive year of record high world supplies of cotton. This situation is attributable to the large carry-over of previous crops, since production as a whole was smaller than in the preceding year, 1937–38. The world carry-over, as on July 31, 1938, was 22,612,000 bales, about 8,800,000 bales larger than the previous year's carry-over and approximately 11,000,000 bales larger than the ten-year average annual carry-over (1927–36). The 1938–39 supply of United States cotton was estimated at 25,525,000 bales, compared to 25,200,000 bales in other countries. United States cotton on hand July 31, 1938, throughout the world was estimated as 13,650,000 bales. The carry-over of other cotton was: Egyptian, 1,095,000 bales in 1938 and 701,000 bales in 1937; East Indian, 3,226,000 bales in 1938 and 3,209,000 bales in 1937; all other cotton, 4,639,000 bales in 1938 and 3,621,000 bales in 1937.



The large carry-over and huge accumulation of cotton is considered to be due to record production, the 1937 business recession which reduced cotton manufacturing, the war in China, and substitution of synthetic fibres.

World production of cotton in the crop year of 1938–39 was estimated at about 28,125,000 bales, approximately 8,425,000 bales less than the record crop of 1937–38, although 1938–39 production is estimated as about ten per cent larger than the ten-year average and is the third largest in history. About 75 per cent of the decrease is owing to the smaller crop in the United States. The 1938–39 cotton crop in the United States was estimated by the Department of Agriculture at 12,008,000 bales, as against the record yield of 18,946,000 bales the preceding year and a ten-year average crop (1927–36) of 13,204,000 bales. The present crop in China and Manchukuo was estimated at 2,300,000 bales, compared with 3,560,000 bales in 1937–38; Egypt, 1,523,000 bales in 1938–39 and 2,281,000 bales in 1937–38; Northern Brazil, 633,200 bales in 1938–39 and 707,600 in 1937–38. No figures are available for the U.S.S.R., which, with Egypt, Brazil, and China, is largely responsible for an increase in cotton production in the last ten years. China, however, increased production greatly only from 1932 to 1936, and has since declined.

World mill consumption of cotton in the year ending July 31, 1938, was reported as 27,565,000 bales, compared with 30,689,000 bales (the record high level in world consumption) for the year ending July 31, 1937. For the year ending July 31, 1936, world mill consumption was 27,708,000 bales, and the ten-year annual average (1927–36) was 25,555,000 bales

United States. The 1938–39 cotton crop of 12,008,000 bales was from 25,346,000 acres harvested, compared with 18,946,000 bales from 26,449,000 acres the preceding year. The 1938–39 acreage was the smallest since 1900, and the crop the smallest with two exceptions (1934 and 1935) for fifteen years. On March 12, 1938, 1,527,028 United States cotton growers voted in a referendum in favour of the Agricultural Adjustment Administration's programme to restrict the 1938 acreage planted to 27,400,000 acres, and to grant benefit payments and loans to growers subscribing to the programme. On Dec. 10, 1938, the A.A.A. again submitted a similar referendum to the growers, more than 85 per cent of whom approved. Thus, quotas will again be allotted to growers, and the total acreage planted in the spring of 1939 is expected to be about the same as in 1938. As accurately as can now be determined, government payments will be made of 3·6 to 4 cents per lb. on the farm's normal yield per acre of cotton for each acre in the cotton allotment. Benefits for participation in the A.A.A. soil-building plan are included. Farmers producing more than the allotted quota are to be penalized 3 cents a lb. on the excess in 1939. (X.)

Cotton Manufacture. The year 1938 has been a disappointing period for spinners, manufacturers, and merchants in the English cotton industry. Owing to the slackening off in world demand for textiles, Lancashire producers have been compelled to stop a large proportion of the machinery. The setback in trade was first noticed

Sport & General]
RAW COTTON STOCK DRYING IN A U S FACTORY

in the autumn of 1937, and has continued almost uninterrupted. There has been a smaller demand from world markets, in addition to a reduced turnover for the British home trade. Apart from what might be termed local difficulties, the situation was vitally affected by the international political developments. The period which preceded the crisis in September, and which terminated in the signing of the Munich Agreement, was an anxious one, for although English cotton spinners and manufacturers received fairly substantial contracts under the rearmament programme, they by no means compensated for the shrinkage in business with markets, which in normal circumstances would have been buying cotton fabrics.

The significant factor has been the further decline in the British export trade. The reduced turnover was attributed to the decline in the purchasing power of the millions of people in East and Far Eastern countries which had been brought about by the relatively low prices prevailing for agricultural products and raw materials generally. Apart from this angle, however, there was considerable overbuying of cotton goods in 1937 The world became glutted with cotton fabrics, and dealers and merchants first had to clear these heavy supplies before placing further business. It was only towards the end of 1938 that there were signs of these stocks being reduced. The market for cotton goods is world-wide and English manufacturers have found it increasingly difficult to compete with other countries. This is due to hours and wages in Great Britain being more favourable to the operatives than working conditions in most other countries. In some quarters, the opinion is held that the striking decline in the British export trade in cotton goods has to some extent been caused by the artificial price level for cotton yarns which has resulted from the various fixing agreements amongst spinners. These agreements, however, have stabilized selling rates, and there is no doubt that they have prevented serious financial losses, for without the price pacts, internal competition would have been acute and selling rates brought down to a ruinous level.

The spinning mills, in common with other textile sections, have suffered from the full force of the trade setback, and it is estimated that throughout 1938 the machinery has been worked between fifty and sixty per cent of full capacity. The falling off in trade placed a severe strain on the price-fixing agreements, for firms which loyally observed the pacts found that they were losing business to the comparatively small number of mills which remained outside the agreements. The situation reached a head in August of 1938, when it was decided to make a reduction in selling rates under what is called the 56's Weft Agreement. In September, spinners under the Medium American Ring Agreement abandoned the scheme, with the result that prices were immediately reduced. Other cuts in selling rates took place in October. The price scheme in the section spinning yarns made from Egyptian cotton has operated successfully, and in Sept. 1938, it was renewed for a further period of twelve months. In November it was announced that a comprehensive price agreement was being drawn up to cover all yarns made from American cotton, and this should be placed before the trade for consideration early in 1939.

Position of Manufacturers. The trade depression in the English cotton-weaving section has been more pronounced than in the spinning branch, for whereas the spinning mills have been operating under price-fixing agreements, cloth manufacturers have been competing against each other for the limited trade available, with the result that business, generally speaking, has not been profitable. It is estimated that production throughout 1938 has been around fifty per cent of full capacity. In October, however, business started to improve. Buyers were more prepared to place orders for export, but the whole trade outlook was still overshadowed by the European political situation. In the British home-trade market, dear stocks have had to be liquidated, but towards the end of the year larger contracts were placed with manufacturers, and there were indications of freer clearances in the wholesale and retail establishments The manufacturing section of the cotton industry has not yet dealt with the question of redundant machinery as has been the case in the spinning branch, but the matter has been receiving the attention of the responsible organizations, and there is a possibility of a scheme being devised.

Reorganization. In the King's Speech at the opening of Parliament in Nov. 1938, reference was made to the proposed Enabling Bill under which it is hoped to negotiate schemes which have for their object the rehabilitation of the industry and the maintenance of trade at a profitable price level. The proposals have been strongly opposed by a minority of interests, but the real strength of this opposition will not be disclosed until a ballot of the proposals has taken place. It is probable that the outstanding provisions in the Bill will deal with the fixing of selling prices and eliminating redundant machinery No serious difficulties will present themselves in coming to some price arrangements in the spinning branch, but the problem of fixing minimum selling rates for cloth is likely to present obstacles That reorganization is required in the industry is acknowledged on all sides. It is the methods under which it is proposed to attempt to recover lost trade that separate the sponsors of the Enabling Bill from the opposition firms. English cotton manufacturers are not behind the times in their efforts to improve the export trade, and evidence is brought to light each week of producing firms improving and developing their production methods so far as their finances will permit. In this respect the adoption of automatic weaving is becoming more widespread, and the pace would be accelerated if firms had sufficient capital resources.

The Outlook. At the end of 1938, traders were encouraged by indications of a larger turnover in the export

trade. They were also cheered by the probable benefits which are expected to accrue from the trade agreements negotiated with the United States and Egypt. It is difficult to take on the rôle of prophet when dealing with the English cotton industry, but it does seem probable that the first half of 1939 will witness an improvement in the turnover as compared with the last six months of 1938. Trading conditions, however, will be affected by any change in the political situation, either in England or on the Continent. If a long view is taken of the prospects in the English cotton industry, there appears to be little ground for optimism. Economic nationalism is resulting in almost all countries striving to produce sufficient textiles to satisfy their own needs. Where there is a surplus of textile fabrics, they are exported at prices with which English manufacturers find it virtually impossible to compete. Lancashire has already lost the huge trade formerly done in the commoner and cheaper styles of cotton fabrics, and the tendency will be to concentrate on fabrics which, for various reasons, cannot be manufactured, either in quality or at the same price level, by other producers. But even in this respect, it seems to be only a matter of time before Eastern and Far Eastern countries will develop their industries and the skill of the workers, so that these speciality fabrics can be manufactured by their own particular mills. This is the position which English manufacturers are facing, and every effort is being made to maintain the present export trade. There appears to be little hope of any material reduction in production costs. As a matter of fact, present tendencies point to a movement in the opposite direction, for it is only a matter of time before the employers will grant holidays with pay to the workers, and this will increase the total wage bill. The best thing that could happen would be a world improvement in commodity prices, for English spinners and manufacturers would then benefit from a general world improvement in trade, which, economists agree, would follow a development of this kind. (F. W. Ta.)

[1] Including disputed area (approx. 100,000 sq. miles).
[2] Nov. 1938, including transferred areas.

Note. All the above-named States are members of the League of Nations, with the exception of those marked *, which have never acceded, and those marked †, which have resigned membership: Chile, Italy, Salvador, and Venezuela (marked §) have also announced their withdrawal from the League, the withdrawals becoming effective respectively, in May 1940, Dec. 1939, Aug. 1939, and July 1940.

‡ Burma's membership of the League is, for the present, covered by that of India.

COURSING. This sport was badly hit during the 1937–38 season by the heavy rains, which caused a shortage of hares, and by the prevalence of foot-and-mouth disease. The Barbican and the Netherby Cups, for example, had to be abandoned. Successful meetings were, however, held, *inter alia*, at Widdrington (Nov.), Druid's Lodge (Dec.), and Thanet and Altcar (Jan. and Feb.).

In the Waterloo Cup the winner, Mr. H. C. Pilkington's "Perambulate" (11 to 8 against) beat Mr. R. Rank's "Rotten Row", which for two days had been lame in one foot; and, of other leading events, the South of England Cup went to "Wet and Cold", and the Lonsdale to "Wrack Chain".

Regulations governing the registration of dogs were

tightened up with the object of preventing certain malpractices. In the 1937 and 1938 seasons registrations were respectively 9,891 and 10,261, of which 4,741 and 4,799 were re-registrations. The numbers of litters entered in the Stud Book were 1,318 in 1938, showing an increase of 114 over 1937's total.

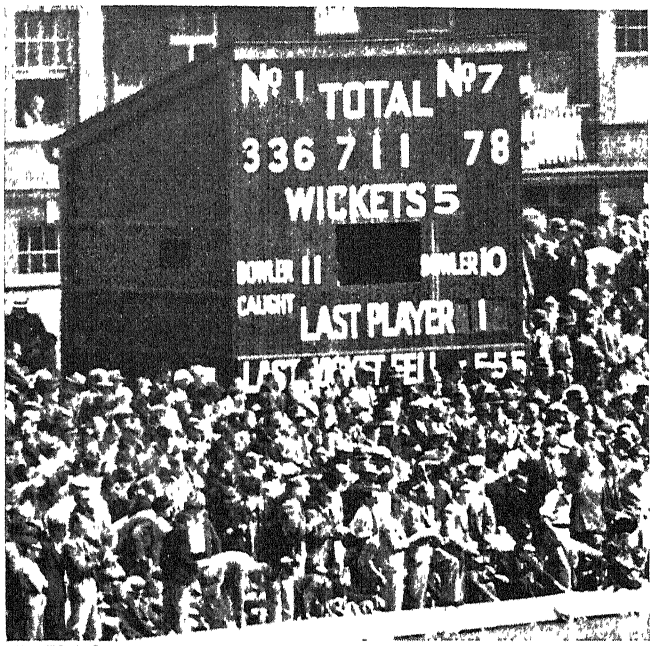
Lt.-Col. Sir John Humphrey, president of the South of England Club and a very popular supporter of coursing, died on July 19

CRAIGAVON, JAMES CRAIG, 1st Viscount (1871–), British statesman, the first prime minister of Northern Ireland, having held that office since 1921. A biographical note will be found in the *Ency. Brit*, vol. 6, p 631

Lord Craigavon has long been known as the very embodiment of the solidarity of Ulstermen for the Unionist cause; and in Jan. 1938, in view of Mr de Valera's forthcoming discussions with the British government, during which he was going to raise the question of the partition of Ireland, he announced a general election for February (*see* NORTHERN IRELAND). Lord Craigavon was returned for Down unopposed, and the sweeping victory gained by the Unionists (followed by a visit by Lord Craigavon to Mr. Chamberlain in London) was hailed by him as " wiping the unification of Ireland " from Eire's programme, though Mr. de Valera did not see the matter quite in this light. Lord Craigavon also visited London in April, and on his return was able to report on certain financial benefits for Ulster agreed to by the United Kingdom government, including an increased share in the rearmament programme.

P. P. Bureau]
LORD CRAIGAVON

Lord Craigavon, being an elected member of the Northern Ireland House of Commons, is the only member of the British House of Lords entitled to the suffix " M.P." He married (1905) the only daughter of the late Sir Daniel Tupper, M.V.O., and has two sons and one daughter.



CRETE: *see* GREECE.

CRICKET. Those who followed cricket closely in the season of 1938 would have found it difficult to avoid the conclusion that, from the English point of view, it was a vintage year. In the rubber of test matches played against Australia in England during the summer, the mother country, captained by W. R. Hammond, did far better than had been expected by the majority of authorities on the game; and, even if England did not actually recover the Ashes, they had all the best of the series and, but for one or two magnificent individual performances, on various occasions, by Australian players, they must have won handsomely.

The test at Old Trafford was washed out with no ball bowled, and England lost at Leeds; but they were the better side in each of the other three matches, failing only to have enough in hand, by comparison with their opponents, at Lords and at Nottingham, to force home their advantage. At the beginning there was not really a very great deal between the two sides, and it would be hard to assess that difference in terms of percentages; but all the same there was a difference in the comparative ability of the two sides, and that difference was without doubt in England's favour. At Nottingham nothing but an inspired innings by McCabe stood between England and a victory by a wide margin; while at Lords England, in spite of having to face a very nasty wicket after rain, were still in a winning position when stumps were drawn. Australia won the Leeds match on their merits, but they were fortunate, in that the wicket on which the match was played proved to be one so favourable to spin bowlers. Their fortune lay in the fact that they had practically no choice about their bowlers, and O'Reilly and Fleetwood-Smith (the latter for the only time in the series) found conditions which were ideal for them, and took full advantage of the fact; while England, not knowing before the start how that wicket, which looked perfect, would play, left out a spin bowler and played a second fast one. The Australians deserve all credit for the manner in which they took advantage of their opportunity, and they snatched a win against a side which, in all other conditions of wicket, were superior and had they played their other available spinner, would as assuredly have won as they actually did in the next match at the Oval. The fifth and last test was a game played without time limit, while the previous games were limited to four days; and the longer that match went on the more apparent became the superiority of England, who eventually won by an innings and 579 runs. England's record score of 903 for 7 (declared) included a record individual score of 364 by Hutton.

The winning or the losing of a test series, however, is not the thing by which the success or failure of a season's play, or a tour, should be judged. It is the quality and quantity of the new entry, whether it be in county or test sides, which measure the value of the season. In this matter, England have a very great deal more about which to rejoice than the Australians. No new reputations were made by the tourists, though some reputations were enhanced. O'Reilly gave further proof, if any were needed, that he is the best spin bowler in the world to-day; and Bradman, as a batsman, while not so spectacular as he has been on some previous occasions, made a hundred in every test: and no one could ask for more than that. Brown, who was regarded as the best new-comer on the last tour, went one better, and was a match saver in every sense at Lords, while McCabe saved the first test practically with his own bat. But that is the end of the tale. The side came with a magnificent reputation, which was not dimmed by the defeatist attitude of the majority of critics in England when they landed; but among their new batsmen only Hassett showed any approach to the reputation which accompanied him, and among the new bowlers none did even that. Grimmett and Oldfield were sadly missed.

England, on the other hand, produced Hutton and Compton as completely new batsmen, and Wright as a bowler who seemed to many to drop from the blue; and all three made good in the test side from the start, and must be big factors for the future unless they suffer a total loss of form. In addition, there were several others who, mainly on account of the success of the above-named, did not have a chance to prove themselves as good, but of whom at least as high hopes were entertained before the season started. D. R. Wilcox, P. A. Gibb, N. W. D. Yardley, Wilkinson (the Lancashire spinner), J. G. H. Chalk, and Peter Smith are only a few of the names which come to one's mind. Although they were hovering round the fringe of the side all through, they had no chance, but their time will come.

Fox Photos]
THE SCOREBOARD AT THE OVAL WHEN HUTTON BROKE THE RECORD DURING THE TEST MATCH *v.* AUSTRALIA, AUG. 23, 1938

Edrich alone did not make good this time, but he is such a good player that it would be impossible to lose faith in him in spite of the fact that he played without success in every match. The fact that, in spite of failure, he was persevered with is a real indication of two things. First, it meant that the selectors felt that they had enough in hand over their opponents to be able to continue to play a batsman of whom they felt sure that, although he had not done so, he would succeed; and secondly, it meant that they had realized one very important fact: Edrich was out six times out of eight to the same ball from the same bowler, so that his lack of success appeared to be far more due to his inability to play that particular ball than to any real lack of ability.

Such reflections must lead us to view the events of the summer of 1938, from the English point of view, with considerable satisfaction. There would not appear to have been any season within memory which has provided so much new material and proved such a large percentage of it. English cricket would appear to be well on the up grade, and approaching the crest of the wave.

As is natural, county cricket suffered a lot of interference, due not only to the tests, each of which affected two county games, but also to the trial match held at Lords. Yorkshire, in again winning the championship, proved not only their ability but their consistency and their reserve power; for no county side lost more players to the call of country. Hutton, Verity, Smailes, Gibb, Wood, and Leyland were all called on various occasions, and when they played, more than pulled their weight in the test team.

Surrey were another side to improve on their form of recent years, and they did it mainly by virtue of the all-round ability of the individual players who composed their side, and the manner in which they were held together in spite of the absence, on so very many occasions, of their official captain.

Essex started the season very badly, but finished well, as one would expect them to do with four such bowlers at their disposal as J. W. A. Stevenson, K. Farnes, Nichols, and Peter Smith, all of whom played with success in the Gentlemen *v.* Players match at Lords.

On the whole the county season was a good one, to which the persistent challenge of Middlesex for the championship added a tremendous lot of interest, although that effort again failed. Middlesex were not the only county to produce new blood successfully, for most sides seemed to emulate the deeds of the test side in the way of fresh talent.

The other historic matches at Lords resulted in a win for the Gentlemen over the Players by 133 runs, and drawn games between Oxford and Cambridge, and Eton and Harrow.

FINAL POSITIONS IN THE COUNTY CHAMPIONSHIP

* Including two points for first innings tie in match lost. There were nineteen matches with no result at all

As is natural when there is a test series between England and Australia, this seems to fill the cricket eye almost completely, and the tremendous publicity which is given to such matches, all over the cricket world, seems rather to obscure what is taking place in other fields, quite apart from the fact that Africa and New Zealand play their cricket during the English winter. News of the doings abroad is therefore rather sparse in test summers in England, though there has been sufficiently encouraging news of the game in South Africa to add rather more than the usual amount of interest to the visit of Hammond's side to that country in the winter of 1938–39.

The game flourishes in all corners of the world, as it should do, and at the same time, it progresses, as must all good things. To many it is a moot point whether or not the growing volume of publicity which envelops the game is for its benefit, but apart from the fact that we must all admit its growth, that is not a fit subject for discussion in this place. New life must enter the sinews of the game as new blood is successfully introduced to it; and in that respect England at least is taking a new lease of life, and, knowing them as we do, the Australians will not be very far behind. The 1938 season must now rank as one of the most successful in post-war cricket, and, as a result, the prospects of the game for the future must be brighter than they have been for some years. (P. G. H. F.)

CRICHTON-BROWNE, SIR JAMES, British physician, was born in Edinburgh on Nov. 29, 1840, and died at Dumfries on Jan. 31, 1938. He was educated at Trinity College, Glenalmond, and at Edinburgh University and Paris. Specializing in the mental aspects of medicine,

he served successively as assistant, and later as superintendent, at different asylums, and earned himself a national reputation as medical superintendent of the West Riding Asylum at Wakefield from 1866 to 1875. From 1875 to 1922 he was Lord Chancellor's Visitor in Lunacy. Throughout his career he gave vigorous expression to his opinion on matters of public health, and his opinion was held in general respect. He was knighted in 1886. He was the author of: *Victorian Jottings*, 1926; *What the Doctor Thought*, 1930, and several other volumes, as well as pamphlets, including one on *What We Owe to Alcohol*, 1918.

Vandyk]
SIR JAMES CRICHTON-BROWNE

CRIME. Under this heading are reviewed the criminal statistics of Great Britain and the United States of America during 1938.

Great Britain. Criminal offences in Great Britain are divided into two main categories—indictable (larceny, breaking and entering, violence against the person, etc.) and non-indictable (traffic offences, drunkenness, breach of by-laws, failure to take out licences, etc).

The latest statistics show that there has been an increase in every type of non-indictable offence except assault and Education Act transgressions. Traffic offences, which furnish 59 per cent of the total number of offenders of all types, were thirteen per cent higher in 1936 (the latest year for which complete figures are available) than in 1935. At 488,297 they stand at a record total; of these, 57,555 were cases of obstruction. Motorists formed 79·8 per cent and cyclists sixteen per cent of all traffic cases. Drunkenness, too, is on the increase, there being 46,757 cases as compared with 44,525 in the previous year, an increase of five per cent. The total is still, however, substantially below the record figure of 53,080 cases in 1930. Non-indictable assaults, on the other hand, show a decrease of 2,658 in relation to the 1931 total. Offences by prostitutes have risen from 1,260 in 1931 to 3,343, the trend being steadily upwards every year. Education Act offences fell in the same period from 7,318 to 4,988.

Turning to indictable offences, convictions in respect of those committed by persons under seventeen years of age (*see* JUVENILE DELINQUENCY) have risen from 20,540 in 1934 to 27,126, while persons over seventeen found guilty show only a slight increase at 45,659 in comparison with 45,196 in 1934. Of the 72,785 offenders listed in the most recent statistics, 51 per cent were aged 21 and over, twelve per cent were between seventeen and 21, and 37 per cent were under seventeen. Three hundred and eighty-three men and boys out of every 100,000 in the population were guilty of indictable offences, the corresponding figure for women and girls being 49; in 1929 these figures were 299 and forty so that there is a substantial increase in both groups. Of the 45,659 persons over seventeen found guilty, 74 per cent were convicted for larceny, ten per cent for receiving, false pretences, and fraud, six per cent for breaking and entering, four per cent for miscellaneous offences, three per cent for sexual offences, and three per cent for offences against the person. The most common forms of larceny are thefts from shops and stalls, "larceny by a servant", thefts of pedal cycles, thefts from unattended vehicles, and thefts from automatic machines and meters. Of the "breaking and entering" offences nearly half related to shop-breaking. In 79·4 per cent of the cases of theft (larceny, and breaking and entering) known to the police, the value of the property stolen was under £5; in 19·3 per cent it was between £5 and £100; while in 1·3 per cent it was over £100. Of the "receiving, frauds, and false pretences" group, obtaining by false pretences was the most common offence, followed by receiving stolen goods. In 103 out of the 232 cases of persons between seventeen and 21 years of age concerned in sexual offences, the charge was indecent assault; the corresponding figure for persons over 21 was 524 out of 1,267; 34 per cent of those over 21 in this category were under thirty years of age.

Nine hundred and fifty-one of the 1,162 persons charged with violence against the person (wounding, manslaughter, infanticide, murder, etc.) were found guilty of "wounding", and of these 728 were dealt with summarily; forty per cent of the total aged 21 and over were under thirty. In 33 out of the 99 cases of murder known to the police, the murderer or suspect committed suicide Out of 64 arrests, 23 persons were convicted and sentenced to death. Of these, eight were executed, in thirteen cases the sentence was commuted to penal servitude, and two convicted murderers were certified as insane. In five cases of known murder the murderer escaped.

The total number of persons committing suicide has increased from 3,474 in 1911 to 5,007 (3,408 males and 1,599 females); this high figure (a drop, however, of 216 on the previous year's) is thought to be largely due to the great increase in the number of persons of 45 and over in the population, amounting now to sixty per cent. On the per million of the population in various age groups basis, suicides of men under 55 have actually decreased, those of men over 55 showing a slight rise; while among women, whereas the figure for those under 25 is much lower than it was in 1911, both the under- and over-45 groups show increases.

A notable tendency of recent years has been the decrease in the number of persons sent to prison for debt; for non-payment of fines, for example, the decrease in convictions amounts to 23 per cent in comparison to 1935; for failure to pay wife maintenance orders committals decreased by 19·5 per cent, for affiliation orders by 33·8 per cent, and for rates 33·4 per cent. (V. B.)

United States. For the nine-year period beginning with 1930, there has been a gradual decline in all classes of reportable crimes, except for rape and larceny, which have increased perceptibly. The year 1936 was notable for the smallest number of "crimes known to the police" thus far recorded. In 1937 there was a slight upturn for practically all classes, but in 1938 the totals turned downward again or remained close to the 1937 levels. Thus the general trend continues downward.

The New England and Middle Atlantic States have the lowest urban crime rates, with the South Atlantic, East South Central and Pacific Coast States reaching the highest levels. In America the larger the city, the larger is the ratio of crime to population.

For the first nine months of 1938, 55·7 per cent of the total of all reportable crimes were larcenies. Other major categories included burglaries, 23·8 per cent; motor-

car thefts, 12·8 per cent, and robberies, 4·0 per cent All of these offences, representing 95·6 per cent of the total, involved unlawful gain as a motive The rather small residue of 4·4 per cent represented attacks upon persons, *i.e.* homicides, rapes, and aggravated assaults

The following comparison of 1937 with 1938 includes 1,750 cities, towns, and villages for 1937, and 1,894 such communities for 1938:

Offences known to the Police, January–September inclusive, 1937–38

Rate per 100,000 of population

Offence	1937	1938
Murder and non-negligent manslaughter	4·6	3·9
Manslaughter by negligence	4·1	3·1
Rape	6·5	6·3
Robbery	40·0	42·4
Aggravated assault	35·5	32·8
Burglary breaking or entering	237·4	243·0
Larceny theft	559·9	584·9
Motor theft	157·9	134·8

The prominent position occupied by larcenies in the foregoing summary invites further analysis Larcenies involving the theft of property valued at more than $50 represented only 13 per cent of the larceny total; those from $5.00 to $50 were 65 per cent, and thefts ranging downward from $5.00 constituted the remaining 22 per cent.

Residences were the object of attack in approximately half the burglaries, 35 per cent of them being entered in the daytime. Of all burglaries, only 21 per cent were committed during the daylight hours.

Of the crimes of robbery, 56·5 per cent were committed on the highway or elsewhere in the open, with commercial establishments standing second at 27·2 per cent. Banks were the objective in only 12 instances out of a total of 10,666 robberies reported.

No figures similar to those given above are available for extensive rural areas, but it is well established that, generally speaking, rural crime rates are lower than those for more densely populated areas, though crimes against the person are relatively more frequent. The relative standings for each class of reportable offence, in 1937, are given below in terms of average groups of 100 urban and 100 rural crimes:

Offences against Property	Per cent		Offences against the Person	Per cent	
	Urban	Rural		Urban	Rural
Larceny	53·9	46·8	Aggravated assault	3·2	5·6
Burglary	22·5	28·2	Rape	·6	2·6
Motor theft	14·9	9·7	Murder	·4	1·5
Robbery	4·1	4·1	Manslaughter	·4	1·5

Similar urban-rural relationships have repeatedly been observed by foreign commentators upon crime in Europe. The relative preponderance of rural murders, manslaughters, and rapes, as shown in the foregoing table, is especially pronounced. (*See* also FEDERAL BUREAU OF INVESTIGATION; JUVENILE DELINQUENCY; POLICE.)

BIBLIOGRAPHY. *Uniform Crime Reports*, 1937 and 1938, Fed. Bureau of Investigation, Washington; *Prisoners in State and Federal Prisons and Reformatories*, 1936, and *Mortality Statistics*, 1935, U.S. Bureau of the Census, 1938.

CROQUET. The open championship of 1938 fell to Mr. D. J. V. Hamilton-Miller; Mr. C F. Colman, whose attractive, quick style was the outstanding feature of the season, won both the men's championship and the President's Cup; Miss D D. Steel won the women's championship for the seventh time in succession and the fourteenth time in all. The open doubles championship went to Mr. C. F Colman and Mrs R. C J. Beaton, and the mixed doubles to Lt.-Col W B du Pre and Mrs. R. C. J. Beaton.

The Roehampton Challenge Cup was won by Dr. Edgar Whitaker—the winner of the open championship in 1911—who this year made a welcome return to the game Mrs. T. H. F. Clarkson won the Ladies' Field Cup, the Men's Peel Memorial went to Mr. Leslie Walton and the Women's to Mrs. S Stannard, and the Gilbey Cup was won by Mrs. J.V Harris. Miss M E Norman won the All England Handicap; Hampshire succeeded Middlesex as leading county, and Roehampton was the winner in the inter-club competitions.

The appointment by the Croquet Association of an authorized instructor met with much success, and in various towns public courts have been laid down by the local authorities. Important proposals regarding the width of the hoops and the dimensions of the court are under consideration.

CUBA. A republic occupying the largest of the West Indian islands; language, Spanish; capital, Havana; president, Federico Laredo Bru, area, 41,634 sq. miles without small neighbouring islands. Population (census, 1931) 3,962,344; (estimate, 1936) 4,108,650, including about 68 per cent whites. The chief cities (with 1930 population) are: Havana, 542,522; Santiago, 103,525; Cienfuegos, 87,699. The United States has a leased naval base at Guantánamo.

Colonel Fulgencio Batista, Chief of Staff of the constitutional army, remained during 1938 the dominating figure in Cuban politics. On March 4 his strength was manifested in the congressional elections for 81 representatives and one senator, in which the 450 candidates nominated by seven parties were all his fervent supporters. After a brief cabinet crisis in August, President Laredo Bru's cabinet resigned so that new appointments might be made along "non-political" lines.

On February 14 Congress passed a measure authorizing an $80,000,000 bond issue with which to retire the outstanding public works bonds. The effort of the Cuban government to settle its old debts was preliminary to the establishment of its own bank of issue and an independent currency. The existing currency is in dollar certificates against silver, printed in the United States and on parity with the United States dollar, but because of its rigid relationship to the dollar it lacks the standing of an independent currency.

In March, the first distribution of State lands to tenant farmers was made, with fifty acres each, to 250 indigent farmers. Colonel Batista personally delivered the deeds. Recipients of the farm lands are required to occupy and cultivate them for six years. The farms cannot be encumbered or sold and are transferable only by inheritance. To increase production of corn and rice, 102,000 lb. and 122,400 lb. respectively of seed were distributed by the Bureau of Agriculture for planting.

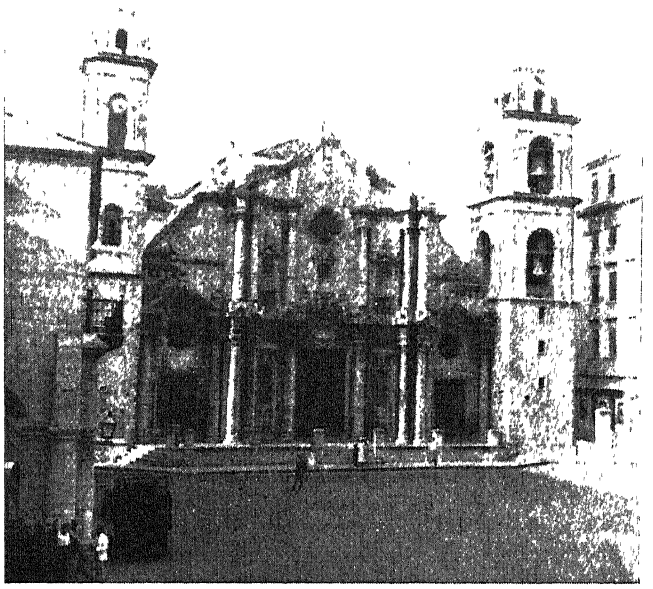
Evidence of some unrest was shown in March, when an alleged conspiracy against the government was exposed. Four men were killed when soldiers surprised a meeting of plotters; later, seven persons received three-year prison terms each for conspiracy.

In April, upon the opening of Congress, Colonel Batista began actively to urge the enactment of legislation called for by his Three-Year Plan, but on May 4 he suddenly announced suspension of the much-publicized Plan until a constituent assembly, to provide the nation with a new constitution, could be held. In a dramatic and unexpected statement he declared he was sacrificing his plans for social and economic reconstruction in the face of the general demand of all parties for a free and sovereign constituent assembly This sudden withdrawal of the Three-Year Plan was considered a master political manœuvre in that it threw all responsibility for the halting of the reforms on the shoulders of the opposition.

Another of the important events of 1938 was the launching of a $6,000,000 public works programme to aid the unemployed, the funds to be obtained through a ten per cent reduction in government expenditures. The plan included repatriation of an estimated 50,000 West Indian labourers and tightening of immigration legislation, wage regulation, and further control of relations between employers and workers.

A thoroughly revised penal code ("Code of Social Defence"), enacted in 1936, came into effect in 1938. Its intent is to "defend society" rather than to punish the individual criminal. Among its provisions is one for levying fines on a basis of the individual offender's capacity to pay.

Education. During the 1937–38 school year 4,115 schoolhouses, with more than 8,300 classrooms, were used for primary schools. The total enrolment was 423,420. It was estimated, however, that 4,000 more classrooms were needed. Reorganization of the 211-year-old University of Havana continued during 1938.



Defence. The Cuban army numbers 1,916 men and officers, the rural guard 600. The navy includes sixteen ships. Both army and navy have air services.

Finances and Banking. The monetary unit is the peso, equivalent to the United States dollar. The 1938–39 budget called originally for $78,513,778·60, but was cut by $9,700,000 in Oct. 1938 because of reduced government income.

Trade and Communication. Cuba is on the main route of the Pan-American Airways, and enjoys excellent external as well as internal air transport facilities. There are 3,850 miles of railways and a network of 2,500 miles of roads, dominated by the 706-mile Central Highway, which runs the length of the island from Havana to Santiago. Telephone and telegraph facilities (10,939 miles) are superior to those of any other Hispanic American republic. There are 54 radio broadcasting stations.

In 1937 imports totalled $129,572,117, while exports were $186,071,036, representing increases of 25·54 per cent and 20·16 per cent over 1936. Approximately 80 per cent of exports went to the United States, while 67 per cent of imports came from that country. Great Britain is second in Cuban trade, with 15 per cent of exports and 5 per cent of imports in 1937. Exports and imports in the first eight months of 1938 declined 27 per cent and 13 per cent respectively, but most of the loss was regained before the end of the year. During 1938 trade agreements were made with Mexico, Great Britain, and Italy.

The principal export commodity is sugar, which comprised 70 per cent of the total in 1937. In 1938 sugar exports increased to 2,746,050 long tons (2,490,725 tons in 1937). Shipments to the United States were 1,663,554 tons, a decrease of 172,181 tons. Sugar exports to Europe increased 157,506 tons over 1937. Tobacco is second to

A. Costa]
THE SPANISH BAROQUE CATHEDRAL OF HAVANA, CUBA

sugar as an export item. Imports are foodstuffs, textiles, machinery, and other manufactured articles.

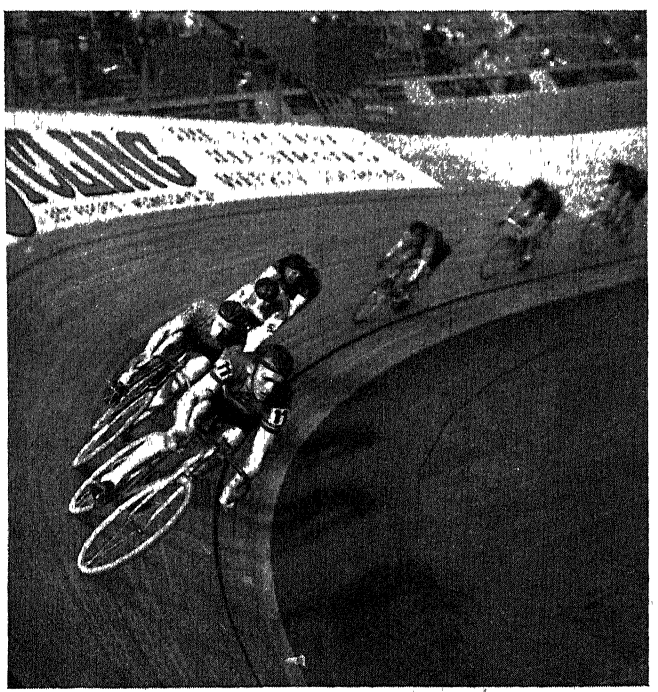
Agriculture and Mineral Production. Owing to world over-production, sugar production is restricted by international agreement. In 1937 slightly over 3,000,000 long tons was produced; for 1938 the quota was set at 2,950,000 tons, of which all but 150,000 tons was for export. Coffee is also increasing in importance, with 152,460 acres planted, and an estimated production of over 71,000,000 lb. To permit Cuban coffee to compete in foreign markets on equal terms with that of other countries an export subsidy is given.

Encouragement to gold mining was given on Oct. 20 with the abolition of the previous export duty of 15 per cent. Special legislation for the development of potential petroleum resources was enacted in 1938, resulting in considerable explorative efforts, but as yet no development of consequence. Approximately one-sixth of the area of the country is forest. A valuable sponge industry centres at Batabano. (L. W. Be.)

CURAÇAO. Dutch West Indian island in the Leeward group off the coast of Venezuela, with which are included the nearby islands of Aruba and Bonaire and the small Windward islands of Saba, St. Eustatius, and St. Martin. Capital: Willemstad (pop. 27,231). The area of Curaçao is 212 sq. miles, of the entire colony 436 sq. miles. Population (1936 census) 90,870, with 58,233 on Curaçao, and 21,638 on Aruba. The colony is administered by an appointed governor and partially elected council. In 1936, the latest year for which statistics are available, imports aggregated 197,012,376 florins in value (Venezuela 75·6 per cent; the United States 8·5 per cent; Colombia 5·7 per cent; and the Netherlands 2·1 per cent). Crude oil (principally from Venezuela, with some from Colombia) represented 77·6 per cent. Exports (1936) aggregated 201,512,618 florins, of which petroleum and its derivatives represented over 99¼ per cent, chiefly to Great Britain (31·3 per cent), the Netherlands (11·2 per cent), and the United States (20·2 per cent), with 8,165,717 florins value in oil products to ships. The colony's chief industry is oil-refining. It is also important as a producer of phosphate, exporting

600,818 florins value in 1936 The monetary unit is the Dutch florin (8·70 to the pound sterling approx). The entire colony (1936) had 49 schools, mostly parochial, with total enrolment of 12,474 The population is over 75 per cent Roman Catholic. (L. W BE)

CURLING: *see* WINTER SPORTS



CURRENCY: *see* EXCHANGE RATES

CYCLING. In England and Wales the popularity of cycling was well maintained. It is estimated that there are 10 million cycles on the roads. There are approximately 2,000 clubs, and in 1938, its diamond jubilee year, membership of the National Cyclists' Union for the first time exceeded 60,000.

The outstanding event of the year was the appointment of a National Organizer under the Physical Training and Recreation Act From some hundreds of applications the choice fell on Mr. J. E. Holdsworth, an ex-racing man who had become an official of the N C.U. , he commenced his duties on Nov. 1, and the appointment is, in the first instance, to March 31, 1940. During the year the Traffic Advisory Council published its report dealing with the use of cycle paths, rear lights, riding more than two abreast, etc. ; no bill embodying the recommendations made has yet been presented.

On the racing side, the National Sprint championship was won by D. S. Horn, of the Polytechnic C.C. W. W. Maxfield (Kentish Wheelers) repeated his 1937 win in the 25 miles, but in the fifty-mile human-paced R. W. Shand (Southern Elite) sprang a surprise by beating the record holder, E. V. Mills. The Team Pursuit championship was won by Belle Vue, who, in the final of the London competition, established a British record for the distance. Organized for the first time, a National Massed Start championship, held at Donington motor track, was won by J. Holmes (Yorkshire Road Club)

In the world championships, Scherens was at last beaten in the professional sprint, the new holder being Van Vliet of Holland. The other world champions for the year are : amateur sprint, Van de Vijver (Holland) ; amateur road, Knecht (Switzerland) ; professional motor-paced, Metze (Germany). The six-day International, held at Wembley in May, was won by the Belgian team, Buysse and Billiet, their tenth win in events of this kind At the professional meeting (Herne Hill, September), Karel Kaers (Belgium), world's professional road champion, beat Harry Hill of Sheffield in the 1,000 metres (standing start), the ten-mile pursuit, and the five-mile motor-paced. (L H. D.)

Fox Photos]
THE SIX-DAY CYCLE RACE AT WEMBLEY, MAY 1938

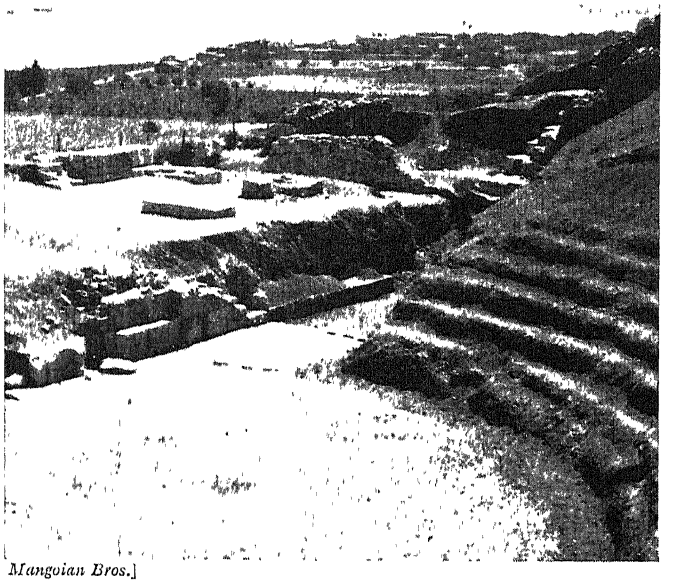
In the United States a new record for the Pikes Peak, Colo., bicycle run was established by J. A. Armado. Three East Indians completed a bicycle trip half way round the world in five years, a total of 35,000 miles made for good will and education, arriving in New York in Sept. 1938

CYPRUS. The year 1938 was a relatively prosperous one for Cyprus. Crops were fair and prices for some improved. The mining companies continued to be an important economic factor by reason of the increased purchasing power which the wages they distributed gave the people.

Towards the end of the year labour disputes, mainly concerned with the question of wages and conditions of working, broke out, and trade unions made their appearance in connexion with some of the local industries.

The main legislative measure was the Rural Debt Bill, which aims at relieving the farmer in respect of his indebtedness, and will be enacted after the government has considered the criticisms of the local financial authorities. The rural debt is estimated at about £2 millions. The Bill proposes to examine the position of each debtor, fix what he is capable of paying, with a reduction of thirty per cent in most cases but unlimited in others, and then spread the net amount over a period of fifteen years.

Cyprus's great need of water was taken in hand during 1938. Schemes costing over £200,000 have been submitted to Whitehall. Considerable areas hitherto scantily supplied with water will receive additional supplies, and their productivity be increased.



Much progress has been made at Fassouri, near Limassol, by Jewish agriculturists in the development of hitherto undeveloped land, which has been converted into prosperous fruit and vegetable gardens. Jewish immigration is welcomed so long as it is not of the labour type. An artificial-tooth factory and a-button factory have been started near Larnaca in order to profit by the Ottawa Agreements and compete in the English market with Italian and other foreign productions. (A. MN.)

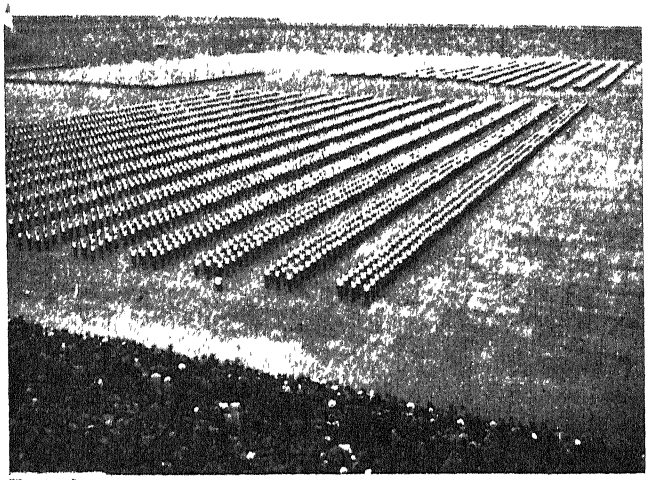
CYRIL, THE GRAND DUKE (Kirill Vladimirovich Romanov), claimant to the Russian throne, was born at Tsarskoe Selo on Sept. 30, 1876, and died in Neuilly, Paris, on Oct. 12, 1938. He was a first cousin of the Tsar Nicholas II, his father, the Grand Duke Vladimir, being a son of Alexander II. Through the marriage of his sister to the late Prince Nicholas of Greece, the Grand Duke was uncle to the Duchess of Kent. He himself married in 1905 his first cousin, the Princess Victoria (*d.* 1936), daughter of the Duke of Edinburgh and sister of the late Queen Marie of Rumania, whose former marriage with the Grand Duke of Hesse-Darmstadt had been dissolved ; and, as a result, he was deprived by the Tsar of all his honours, and lived in exile until 1910. His children are the Grand Duke Vladimir (*b.* 1917), who succeeds him, Marie, Princess of Leiningen, and Kira, Princess Louis Ferdinand of Prussia. The Grand Duke Cyril served in the Russo-Japanese war, being on the bridge when the battleship " Petropavlovsk " was mined, and commanded a regiment of marines during the World War. After the 1917 revolution he at first offered his services to the Provisional Government, but later fled via Finland to France.



CZECH LITERATURE. Otokar Fischer died on March 12, and Karel Čapek on Christmas Day, 1938. Among collections of poetry Fischer's *Last Poems*, J. Hora's *Home*, and several volumes inspired by the September crisis (Kolman-Cassius, *The Iron Shirt* ; F. Halas, *Torso of Hope* ; J. Seifert's *Put out the lights* ; V. Holan's *September 1938*) attracted most attention. The outstanding novels of the year were : Vl. Vančura's *Horvat Family*, M. Majerová's *Miners' Ballad*, J Durych's *Carnival 1611*, J. Hora's *Breath on Glass*, B. Klička's *Vineyard of the Lord*, J. Karásek's *Paradise Lost*, and E. Hostovský's *Three Old Men* (short stories). Among plays, K. Čapek's *Mother* is most characteristic of the mood of the nation before the crisis. The magnificent volume by A. Matějček on *Czech Gothic Painting*, J. Vilíkovský's *Czech Fourteenth-century Prose*, J. Vašica's *Czech Baroque Literature*, and a volume of studies on *Mácha* testify to undiminished interest in the past of the nation, while excellent translations by E. Saudek of *A Midsummer Night's Dream* and *Twelfth Night* and by A. Skoumal of K Mansfield's *Bliss* show interest in English literature unabated. J Čapek's *Art of Primitive Nations* should also be mentioned The effects of the political upheaval on literature are not yet visible (R W.)

See an article " Twenty Years of Czech Literature " (1918–38), by R Wellek, in the Jan 1939 number of the *Slavonic Review*.

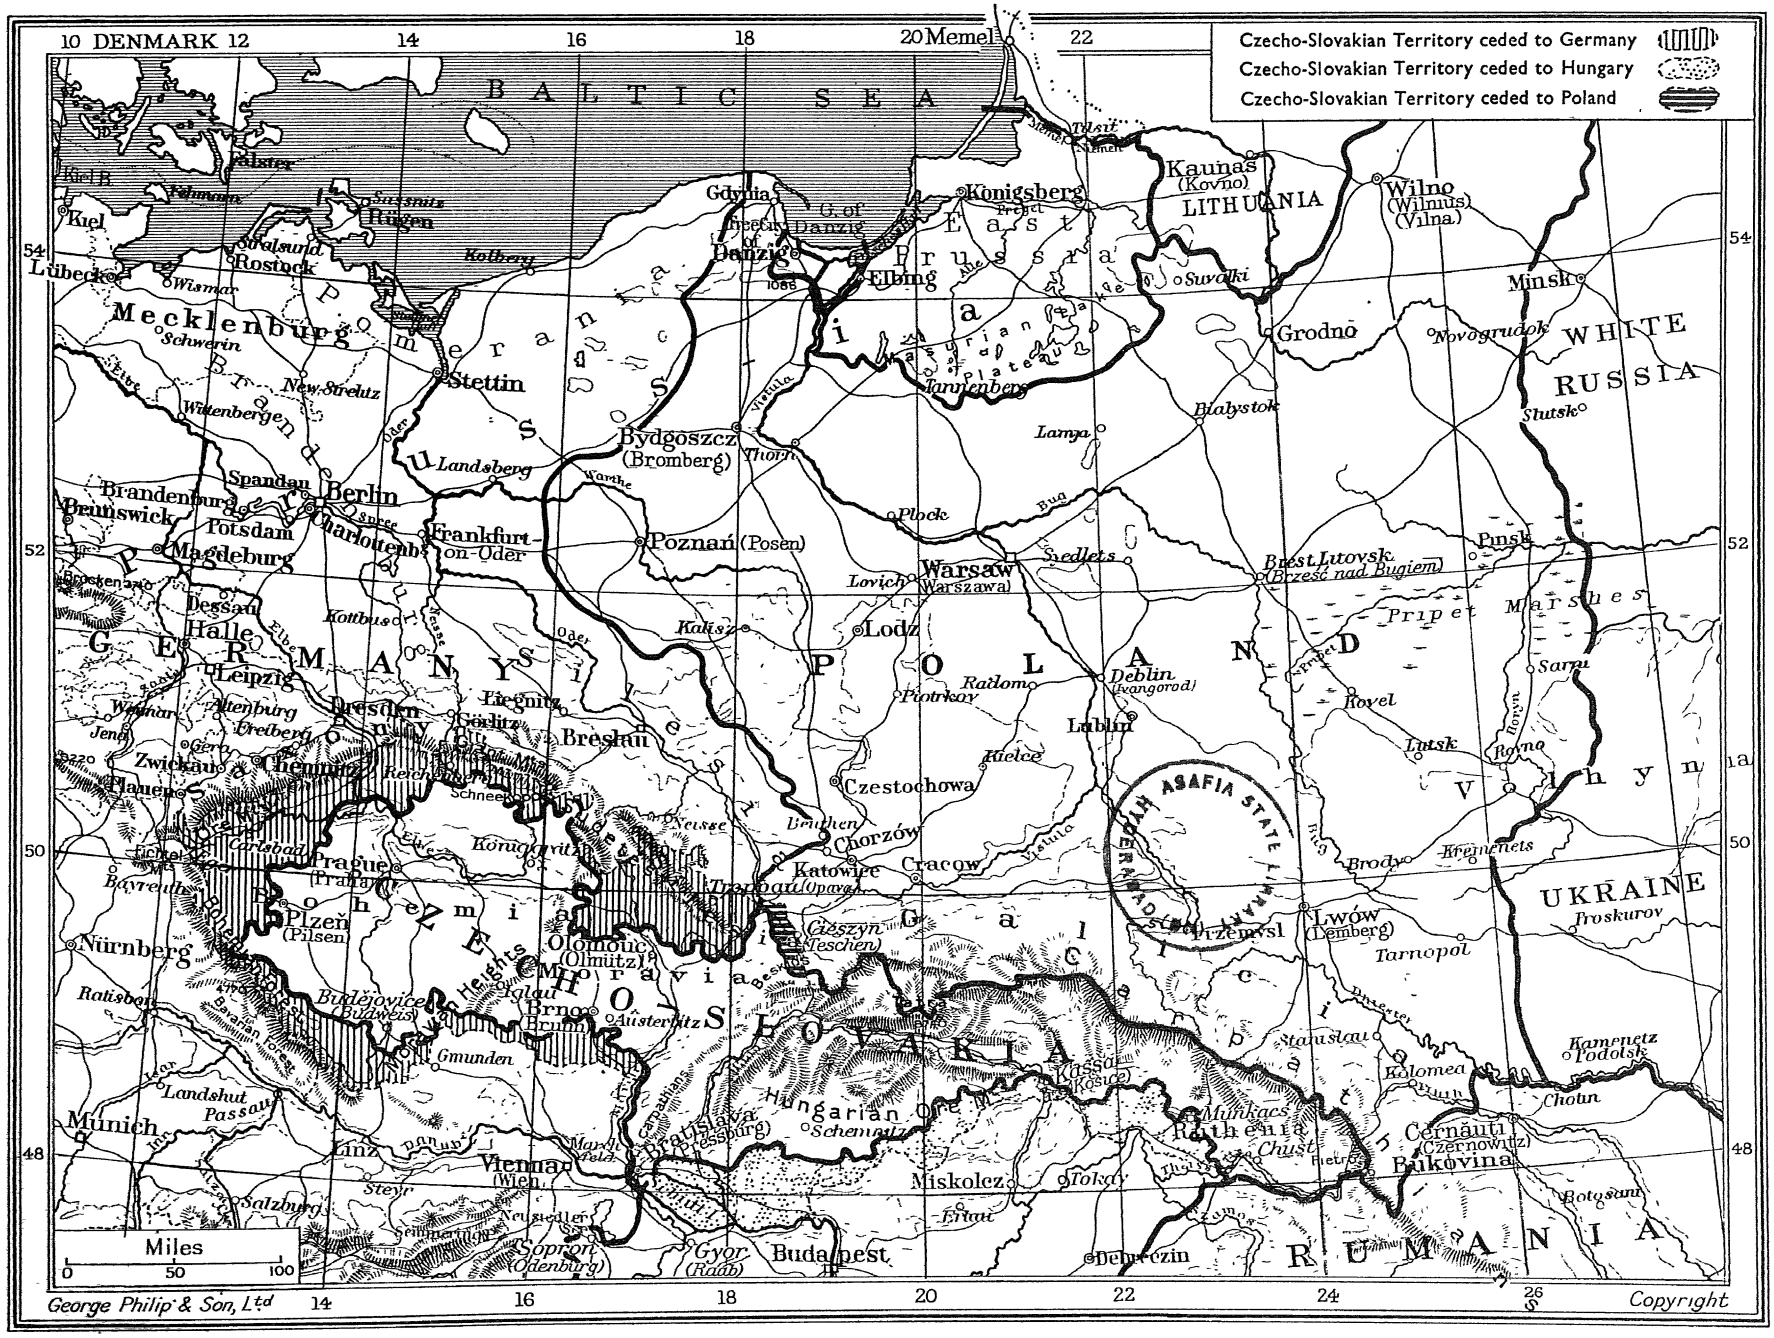
CZECHOSLOVAKIA. The year opened quietly for Czechoslovakia. The Sudetendeutsche Party (S.D.P.) was weakened by scandals and dissensions, and an oppositional movement within it was actually started under the name of " German Socialists ". But Herr Hitler's speech of Feb. 20, referring to the ten million Germans living across the German frontier (*i.e* in Austria and Czechoslovakia) foreboded coming storms President Beneš on March 5 warmly defended Czechoslovakia's treatment of her minorities, although denying that a federal solution was possible. But the absorption of Austria (*q v.*) by Germany at once aggravated the situation. The S.D.P. declared (March 16) that they would co-operate if the government remodelled both the internal structure and the foreign policy of the country on the Swiss model. Three of the " Activist " parties—the German Agrarians, Small Traders, and Clericals—then left the government coalition and joined Henlein ; of the German parties, only the Social Democrats still supported the government, in so far as questions of sovereignty and defence were concerned. On March 24 the Slovak Clericals decided to press for autonomy. On March 28 the government announced that it would consolidate all its minority provisions into a new " Minority Statute ", based on the Constitution, but the S.D.P. rejected this as insufficient. Not only the Slovak Clericals (from whom, however, the Slovak Centralists dissented) demanded autonomy, but the Magyar and Polish groups also (March 29). On April 23 Henlein, speaking at Carlsbad, put forward " eight points " : (1) full equality of status for Czechs and Germans ; (2) guarantee of this by recognition of corporate personality for the Germans ; (3) determination and legal recognition of the German areas within the State ; (4) full self-government for the German areas ; (5) legal protection for citizens living outside their own national areas ; (6) removal of and reparation for injustices inflicted since 1918 ; (7) German officials in German areas ; (8) liberty to profess German nationality and outlook. He added that, if Czechoslovakia wished for a reconciliation with Germany and the German people, she must revise her foreign policy. He declared the present situation intolerable.

The Czech coalition declared point 8 and the demand for modification of foreign policy unacceptable, but was willing to negotiate on modified terms. Henlein replied (May 1) that his demands were not a maximum.

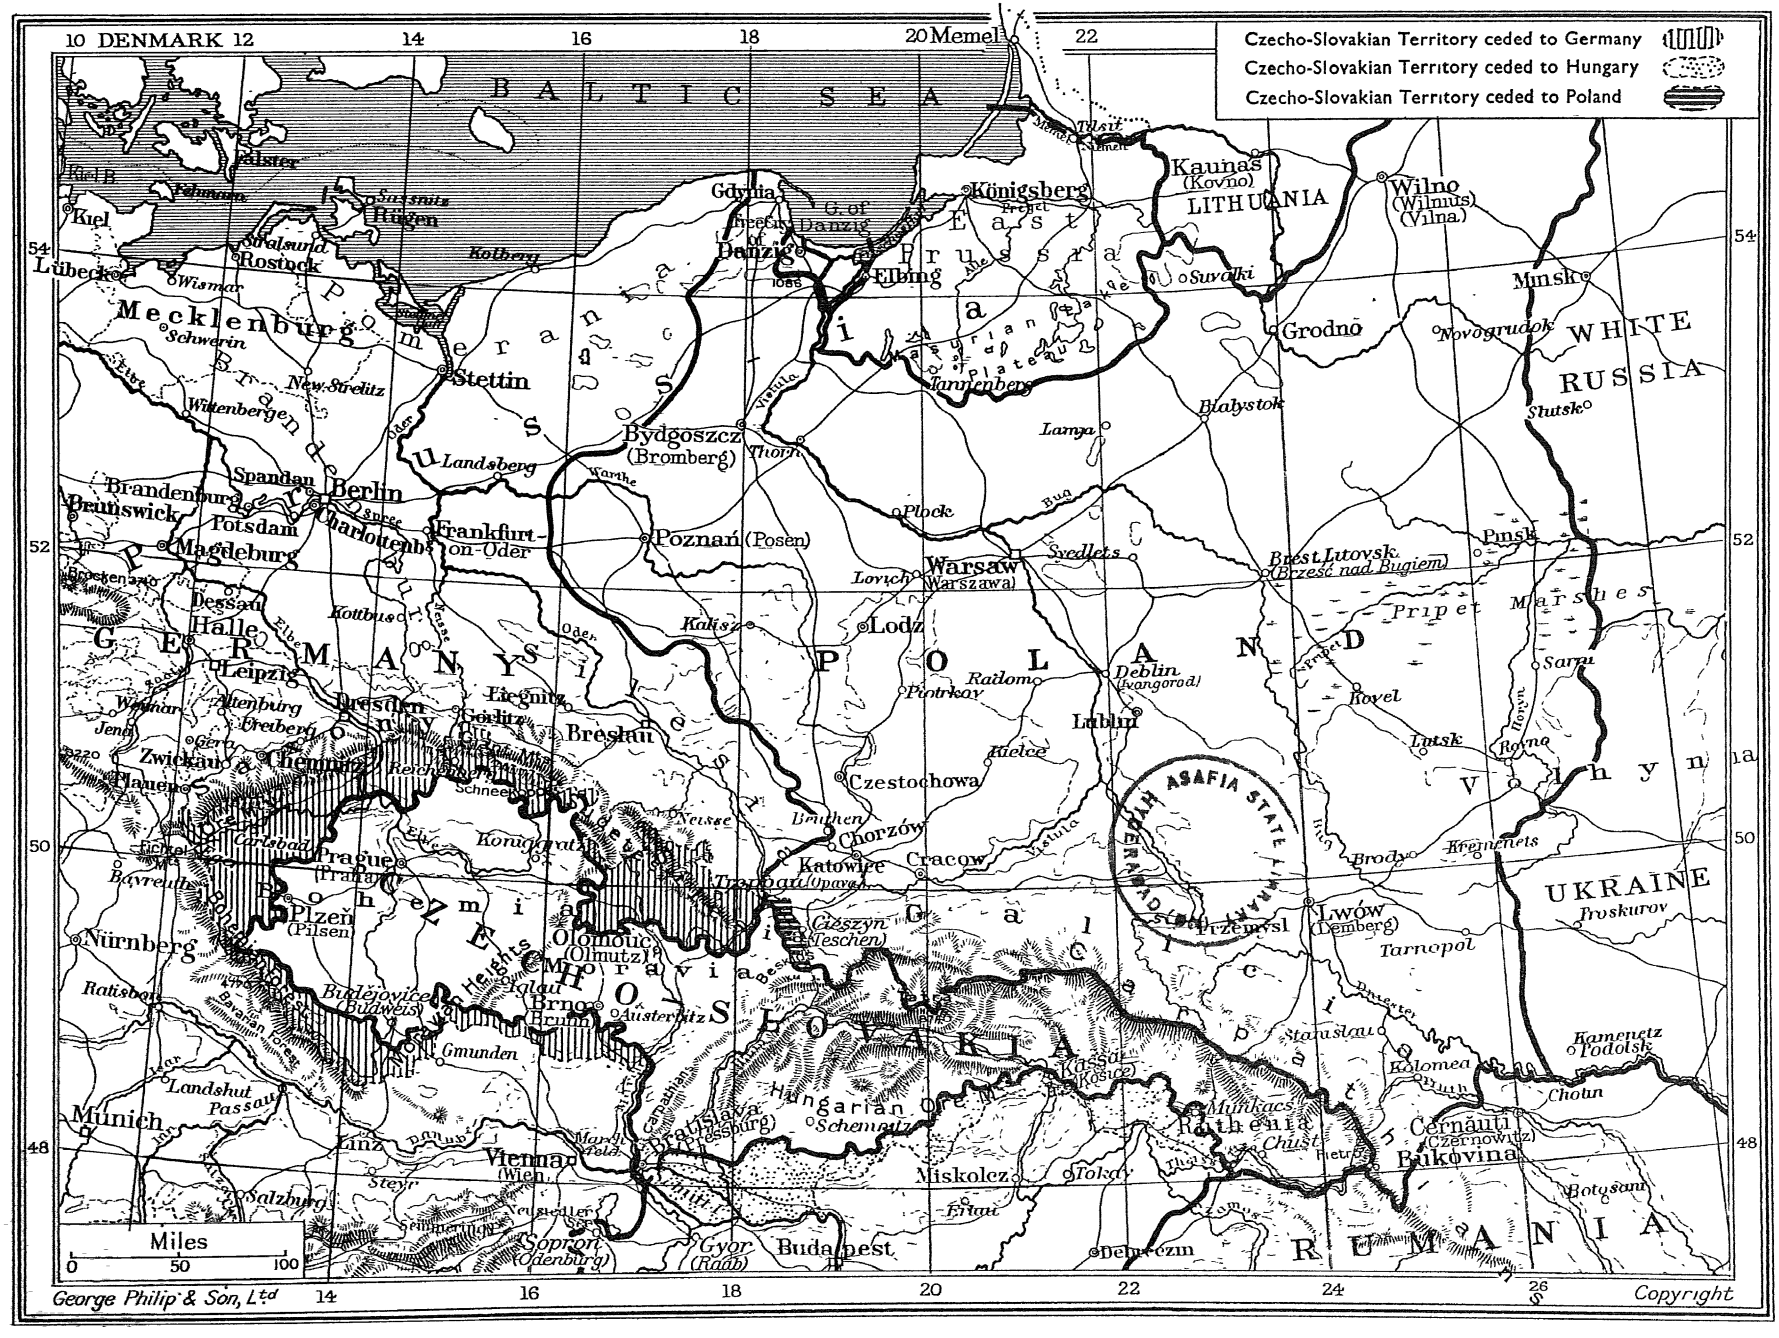
The May Crisis. The government repeated that it would negotiate on the basis of the forthcoming Minorities Statute, which would contain liberal concessions. Meanwhile, however, the respective minority demands were

Keystone]
MASS DISPLAY IN THE SOKOL STADIUM, PRAGUE, MAY 1938

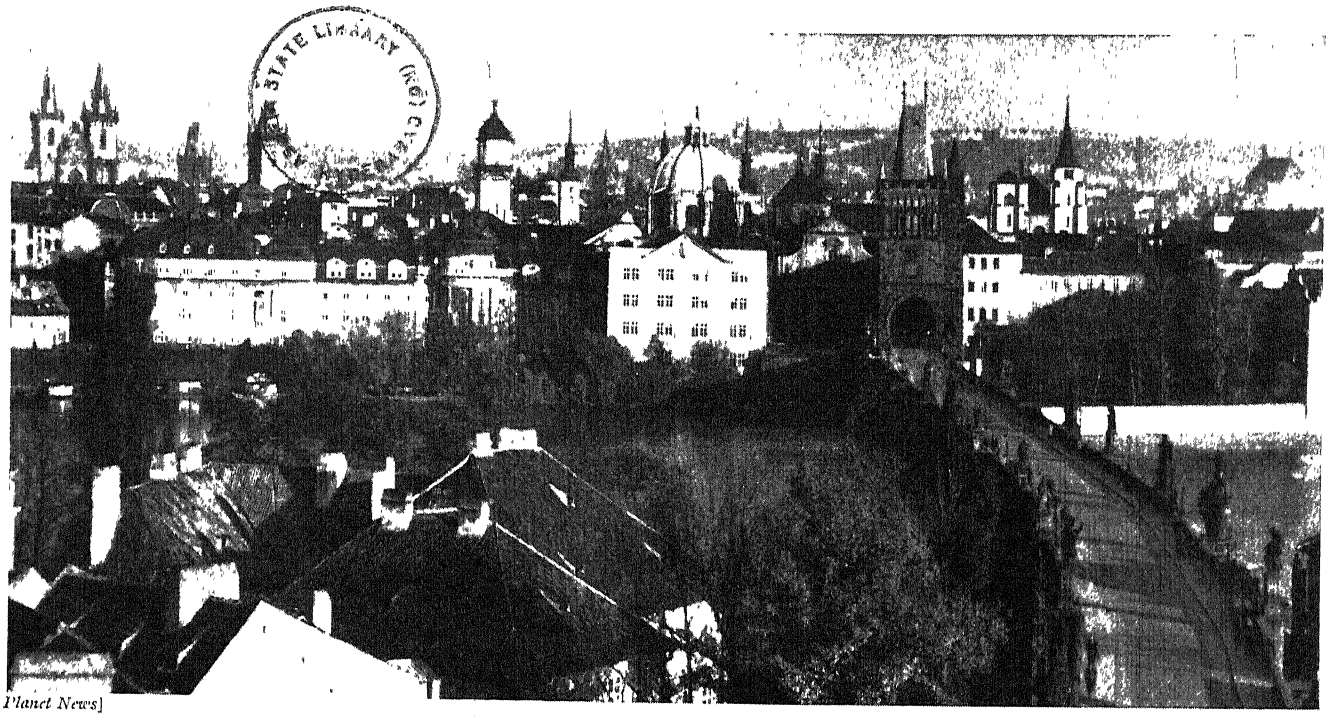
backed strongly by Poland and Germany, whose tone grew very threatening. Britain urged conciliation on both Prague and Berlin (May 7 and 12), but the situation developed very rapidly. Clashes occurred daily. On May 19 Henlein visited Herr Hitler. On the same day, reports were current in Prague that Germany had moved troops up to near the Czech frontier. In spite of official assurances from Germany that these were only routine movements, Czechoslovakia, on the night of May 20–21, called up and sent to the frontier some technical and other troops (an action which, according to Dr. Goebbels's later statement, decided Herr Hitler that the problem must be "liquidated"). France said that if necessary she would fulfil completely her obligations towards Czechoslovakia; Britain (May 23) urged restraint and a satisfactory settlement. In fact, the immediate crisis passed; but the German Press strongly criticized British "interference" in Central Europe, and declared that the rumours of a planned German attack were a legend. Britain should send observers to see for themselves the Czech "terror" and should "call Prague to order".



The local elections of May 22 and 29 and June 6 passed off quietly, the S.D.P. gaining large majorities in the German districts (according to their figures ninety per cent of German votes cast), while the Slovak autonomist parties lost considerably, although they continued and intensified their agitation, producing on June 4 a draft Autonomy Bill providing for the constitution of Slovakia as a complete autonomous unit within the Republic, with a Slovak diet competent in all local matters, and a Slovak administrative and supreme court. Slovak was to be the official language; Slovak soldiers only to serve in formations stationed in Slovakia. Foreign policy, defence, and finance were to remain with the central government.



The government and its coalition continued work on the Statute, interviewing but not negotiating with the minority leaders. The Germans on July 19 published their demands, now fourteen in number. The basis was the Carlsbad Points, but the administrative details were more carefully elaborated, the whole forming a complete plan for the reorganization of the Republic into a federal unit, with complete equality for all nationalities. Defence and foreign affairs remained with the central government, in which each nationality was to be equally represented. Henlein declared (July 25) that nothing short of genuine autonomy was acceptable; he did not ask for annexation to the Reich, nor for a plebiscite. The government on July 28 handed parts of their proposals to the S.D.P., which at once rejected them as inadequate. This "First Plan" provided for four diets competent for local administration, in which each local nationality would have its own "curia". The Germans were to receive proportional representation in the central services, excluding the army. The central government was to retain control of foreign affairs, finance, and defence.



The Runciman Mission. On Aug. 3 Lord Runciman arrived in Prague, sent by the British government with a somewhat mistily defined status of mediator and adviser. He negotiated with the various groups throughout August — a month marked by recurring incidents and friction with Germany, and by the death of Father Hlinka, the Slovak autonomist leader (Aug. 16). M. Tiso succeeded him in the party. From Aug 17 there were direct negotiations between the government and the S.D.P. leaders, but the latter maintained intact their previous demands, rejecting a "Second" and "Third Plan" which progressed in the direction of cantonal autonomy.

Germany's attitude was now increasingly threatening, and the possibilities of intervention by her, through the enormous army engaged on manœuvres, and of a wider conflict, were obvious The German Press persistently alleged terrorism by Czechs of the German areas and the need for action. On Sept. 1 Henlein visited Herr Hitler at Berchtesgaden On Sept 5 a "Fourth Plan" offered proportional employment of officials of different nationalities in government and affiliated services: officials to be employed as far as possible in regions of their own nationality; special financial help for German districts; division of police into State and local; modification of language law on basis of equality; principle of national self-government in form of a system of cantons, delimited as far as possible on national lines, with protection for minorities within them, including the curia system, these to deal with all matters not concerning the unity of the State; registration and protection of nationalities; creation in all government departments of special sections to deal with questions of nationality. These provisions, where not requiring legislative action, to come into force without delay; where so requiring, the laws to be drafted with the collaboration of the various nationalities.

The S.D.P. agreed to continue negotiations and established contact with the Slovak, Magyar, Polish, and Ruthene groups; but incidents continued to increase. Herr Hitler at Nuremberg on Sept. 12 violently abused Czechoslovakia and President Beneš, and demanded self-determination for the Sudeten Germans. If necessary, Germany would help them. The next day the Czechoslovak government proclaimed martial law. The S.D.P. demanded that it be immediately rescinded and the State police withdrawn from the German districts. The government replied announcing strong measures. Henlein replied (Sept. 15) that Czechs and Germans could no longer live together in one State. The Germans wished to go "home to the Reich". Later he established a "Freikorps". The more moderate Germans appealed for further negotiation on the basis of the "Fourth Plan", but the Anglo-French proposals, following Mr. Chamberlain's visit to Berchtesgaden (Sept. 15) of Sept. 18 (presented to Prague Sept. 19), pressed on Prague complete cession to Germany of the mainly German areas,

PRAGUE. THE KARLSBRIDGE WITH ITS BRIDGEHOUSE, AND THE OLD TOWN

following which Britain and France would join in an international guarantee of the remaining frontiers.

On Sept. 21 the government accepted, resigning the next day, when General Sirový became premier. Two days later, however, Hitler (at Godesberg) demanded immediate occupation by Germany, pending a plebiscite, of an area much larger than anticipated. Czechoslovakia declared the new demands absolutely unacceptable and ordered general mobilization. In spite of intercession by Britain and the U.S.A., Germany maintained her demands, although on Sept. 29 Czechoslovakia offered further concessions, suggesting alternatively arbitration. The same day the Munich Four-Power Agreement provided that Germany should occupy between Oct. 1–7 four zones described as preponderantly German, and a fifth zone (limits to be fixed by an International Commission) on Oct. 10. The International Commission was to determine the areas for plebiscite. The problem of the Polish and Hungarian minorities was to be settled by direct negotiation, or, failing agreement within three months, by the Four Powers, after which Germany and Italy would join France and Britain in guaranteeing the new frontiers. Czechoslovakia accepted under protest. The cabinet was reconstructed on Oct. 4, Beneš resigned the presidency (temporarily assumed by Sirový) on Oct. 5. On Oct. 6 the Commission fixed the limits —again unexpectedly extensive—of zone 5. The plebiscite was dropped (Oct. 13) in favour of further direct negotiations. The final frontier was fixed on Nov. 20, Germany acquiring 67 villages in excess of the original proposals and ceding 27. Germany also received a corridor for a motor-road right through Bohemia.

The Polish and Hungarian Questions. Poland had already demanded Teschen (Sept. 20); Hungary notified her claims the same day. On Oct. 1, following an ultimatum, Czechoslovakia accepted Poland's demands. A first zone was occupied that day, the remainder of the Teschen area by Oct. 11; this included Bohumin (Oderberg), which Germany had meant to take. The last districts were ceded on Oct 27. The negotiations with Hungary opened on Oct. 9 and proved difficult. An arbitral award on Nov. 2 gave Hungary the southern edge of Slovakia and Ruthenia (*see* HUNGARY).

Czechoslovakia's total losses were thus: to Germany, 10,900 sq. m. with a pop. (1930 Czech census) of 3,600,000 (2,800,000 Germans, 750,000 Czechs); to Poland, 770 sq. m., pop. 240,000 (77,000 Poles, 130,000 Czechs and Slovaks); to Hungary, 4,630 sq. m., pop. 1,040,000 (592,000 Magyars, 294,000 Czechs and Slovaks, 45,000 Ruthenes, 44,000 Germans, 50,000 Jews).

Internal Reconstruction. Czechoslovakia's internal structure was grievously disorganised; she was further burdened by numerous refugees—Czech, German, and Jewish. A British contribution of £10 millions gave small relief. On Oct. 14 the new foreign minister visited Hitler and promised a "loyal" attitude towards Germany. An economic mission subsequently visited Berlin. The Communist Party in Prague was dissolved, and the Pact with the U.S.S.R. dropped (Oct. 21). On Nov. 12 the main Conservative parties fused in a National Party, the Left forming an United Opposition. On Nov. 17 parliament declared it would adopt an entirely new orientation of policy.

The chief Slovak parties had formed a Slovak Front on Oct. 5 and demanded autonomy, although declaring they would not secede. On Oct. 6 Prague agreed to a wide federative system with a Slovak diet, with representation in a central government The new government adopted a "Christian and national" (totalitarian and anti-Semitic) policy. In Ruthenia, the Czechs retained their troops and administration, but set up a diet with Ruthene ministers, who declared for federal union with Czechoslovakia. All political parties were dissolved. Successive ministers proved unreliable and fled or were imprisoned. Guerrilla fighting went on between the Czechs and Germans on one side, Poles and Magyars on the other, the Ruthenes usually remaining neutral. In December Germany insisted that her wish should prevail and Ruthenia remain within Czechoslovakia. The surviving premier, M. Vološin, belonged to the Ukrainian faction. The pro-Russian tendencies were re-

pressed. On Nov. 19 the Prague parliament adopted the Slovak and Ruthene Autonomy Bills. These transformed Czechoslovakia from a centralized into a federal state in which the three units (Bohemia-Moravia, Slovakia, and Ruthenia) enjoyed in theory very wide independence; although only Slovakia was able to realize this *de facto*, the Czechs continuing to garrison and administer Ruthenia. On Nov. 30 Dr. Emil Hácha was elected president On Dec 1 M. Beran, formerly an Agrarian, formed a new cabinet on an authoritarian and Germanophile basis

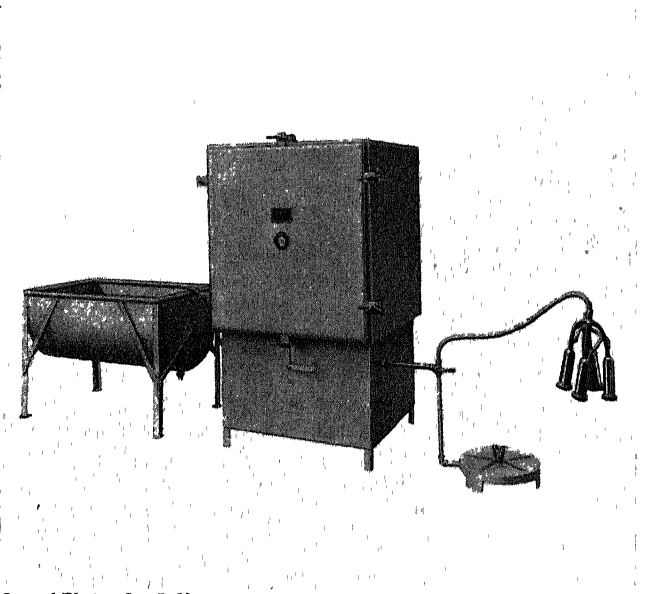
DAHOMEY: *see* FRENCH WEST AFRICA AND THE SAHARA.

DAIRY FARMING AND DAIRY PRODUCE. Within the comparatively small area covered by Great Britain, there was during 1938 an extraordinary variation in the weather and other conditions influencing milk production. In Scotland and the north and west of England there was an abundant rainfall, which resulted in an ample supply of grass during the summer, and of hay and roots for autumn and winter milk production. In the remainder of England a severe drought during the spring and summer caused a serious shortage of grass and a still more serious shortage of hay and roots for winter feeding. These deficiencies had to be made good by extensive purchases, mainly of concentrated foods, and by this means a reduction in the output of milk was avoided. To help to meet the extra cost of production, an increase of *4d.* per gallon in the contract price for milk was sanctioned for July.

The number of dairy cattle was very similar to 1937; the census of June 4 showed no significant changes in the respective classes of stock. The monthly statements issued by the Milk Marketing Board, however, showed an increase in the quantity of milk handled by the Board during the year, due in part to the inclusion of the milk produced by herds holding "Tuberculin-tested" licences, and by herds of four cows and under, which had previously been exempted from the Milk Marketing Scheme, and probably in part to a slightly higher production per cow.

There has been increasing difficulty in obtaining satisfactory labour in many districts, and many producers are giving special attention to the installation of milking machines of the auto-recorder and releaser type, and to other mechanical aids in the management of dairy herds.



During the year the Attested Herds Scheme, for the recognition of herds entirely free from tuberculosis, has made great progress. At the end of Dec. 1937 there were 812 attested herds in England and Wales and 640 in Scotland, and by the end of 1938 these numbers had increased to about 2,400 and 1,000 respectively. The number of herds producing "Tuberculin-tested" milk under the Milk (Special Designations) Order issued by the Ministry of Health had also increased, by some forty per cent, to over 3,000, and the number of holders of "Accredited" licences had increased to fully 23,000. A slight increase in the quality premium which can be earned by the producers of these grades became operative in Oct. 1938, and the financial benefits now obtainable by producers of graded milk will encourage many others to qualify for licences.

In the Dominions south of the equator yearly periods ending in December include the later half of one production season and the first half of the next, and this point is of importance when summarizing dairy farming conditions. In New Zealand a dry summer followed by a cold wet spring resulted in a decrease of some fifteen per cent in milk production. In certain areas production was also decreased by the incidence of facial eczema amongst cows. Systematic efforts to control mastitis are being inaugurated following a survey on the prevalence of this disease amongst herds in the herd-testing associations To aid in the fixing of a fair price for milk and milk products, standards of efficiency of production have been recommended by a representative committee. In Australia, a drought during the summer of 1937–38 lessened production, particularly in Victoria and New South Wales, but the output of milk attained the normal level during the later months of the year

South Africa suffered in the early part of the year from the severe drought of 1937–38, but there was a marked improvement in climatic conditions and milk production during 1938, particularly in South-West Africa.

In Canada, where the production season is the same as in Britain, favourable weather conditions stimulated milk production, and the output per cow was greater than in 1937. This improvement extended to the prairie provinces, but was not so marked in the maritime provinces. In Ontario, new legislation requires that only pasteurized milk may be sold in all towns and villages with a population of over 1,000, and it is claimed that this is the largest area in the world to which compulsory pasteurization has been applied.

Milk, Butter, and Cheese. The proportion of the total milk production in Great Britain used for liquid consumption continues to increase, and this tendency is stimulated by schemes for the use of milk in schools and by industrial workers sponsored by the National Milk Publicity Council. The increase in total production during the last year has, however, been greater than the increase in the sales of liquid milk, hence a larger amount has been available for the manufacture of butter, cheese, and other products. The proportion of the total output used in manufacture was fully thirty per cent, and an increasing share of this quantity was allocated to those products which could afford a higher price for the milk so used. The manu-

General Electric Co., Ltd.]

ELECTRIC STERILIZING CHEST WITH LAYOUT FOR SUPPLYING HOT WATER TO WASHING TROUGH AND EXTERNAL STEAM JET FOR CHURN-STOOL AND MILKING MACHINE CLAW ASSEMBLY

facture of cheese on farms in England has also increased during the year, an additional 4,000,000 gallons being utilized in this manner.

In New Zealand the production of both butter and cheese has decreased, and the trend from butter production to the manufacture of cheese has proceeded at a slower rate. In Australia there was a decrease in the production of dairy products during the early part of the year, but, in spite of a lack of rain in the later months, production, especially in Queensland, equalled, and in some months appreciably exceeded, that of last year.

The production of butter and cheese in South Africa increased during the year, the manufacture of cheese continues to increase, owing to more favourable prices. To avoid a repetition of the shortage of butter which occurred in 1937, action was taken by the government to assist in the storing of an additional reserve to meet requirements in the months of low production

In Canada, the quantity of butter made has increased, but there has been a slight reduction in the manufacture of cheese. There has, however, been a marked increase—some nineteen per cent—in the production of concentrated milk during the year. This was mainly in evaporated milk (unsweetened) and in skim milk powder. (J. MH.)

The declining trend in dairy herds in the United States since 1934 was reversed in 1938 with a slight addition, less than one per cent, to the 24,902,000 cows and heifers more than two years old kept on farms for milking purposes on Jan. 1. The number of yearling heifers being kept for milk cows was 4,923,000 head on Jan. 1, 1938, and on Jan. 1, 1939, was 5,100,000, according to preliminary estimates by the U.S. Department of Agriculture. This should result in an increase of about two per cent in milk cows in 1939, providing older animals are not culled too severely. Milk production in 1938 was estimated at probably four or five per cent more than the 103,000 million lb. production of 1937. The milk flow, from below average production in February, reached a record peak on June 1 and continued at record levels in autumn and winter production.

To-day nearly two-thirds of the manufactured dairy products in the United States are produced in the twelve north central States, and in 1938 cash butter, sold on the Chicago Mercantile Exchange, reached a record of 73,398,087 pounds. The production of the principal products was much larger in the first eight months of 1938 than in 1937, but cheese was the only one showing an increase in consumption, about four per cent in the first eight months. Prices for dairy products declined, although the government entered the market to support the price of butter. Consumption of milk and cream also declined in most urban districts, owing to the recession in buying power beginning in 1937, and ice-cream consumption in 1938 was below that of 1937. The movement of evaporated milk into distribution channels during the first eight months of 1938 was reported by the U.S. Department of Agriculture as about six per cent less than in the same period in 1937.

DALADIER, EDOUARD (1884–), French politician, of whom a biographical notice will be found in the *Ency. Brit.*, vol. 6, p. 985. The son of a baker, he was educated at Lyons, and was a school-teacher until the War, in which he served, retiring as a captain (*Croix de Guerre, Légion d'Honneur*). In 1919 he entered the Chamber as a radical-socialist. Minister of war in 1925, president of the Radical party since 1927, he formed in 1933 a ministry which lasted ten months, and then served under Sarraut and Chautemps. In 1934 he formed another government which, as a result of the riots following the Stavisky scandal, lasted only a few days. Minister of war since 1936 in various *Front Populaire* governments, in April 1938 he became prime minister. He was created G.C.M.G. during the Paris visit of the British Sovereigns in July. At the height of the German-Czech crisis M. Daladier declared partial mobilization, visited London, and later attended the Four-Power Conference in Munich, the peaceful outcome of which added greatly to his prestige, though a minority of extremists termed it a shameful surrender. His subsequent delay in taking measures to restore finances, for which he had been accorded special powers by the Chamber, tended to weaken public confidence in him. An advocate of a modification of the forty-hour week, he pilloried the dissentient communists for their illogical policy in a speech at the annual socialist-radical congress in October, when relations with the communist party were broken off. A widower, M. Daladier has two sons.

concrete dam. The low dam was completed early in 1938, and work was immediately commenced on the project of increasing it by some 300 ft. to a total height of 550 ft Towering 200 ft above the low dam, the steel trestle for carrying concrete trains is complete. An unusual feature of the construction of the Shasta dam is the necessity of boring a tunnel in the west abutment for a temporary relocation of the tracks of the Southern Pacific railroad. Later on, the tracks will be removed to a permanent relocation and the tunnel will be used for the diversion of the river. Construction of the Fort Peck dam received a setback on Sept 22, when there occurred a considerable movement of the earth in the upstream face near the east abutment, involving approximately 8,000,000 cu. yds. of fill. An investigation was started to discover the cause of the slide. Fortunately it did not block the four diversion tunnels, 25 ft. in diameter, driven through the shale under the east abutment, and they are in normal operation The Parker dam, below Boulder on the Colorado river, is now ready to divert water into the Colorado aqueduct for Los Angeles. This dam is unique in that, of its 320 ft. of height, 235 ft is beneath the river bed.

The Vaalbank dam of the Vaal-Hartz project, now completed, has already been of considerable assistance in storing spring floods and alleviating autumn drought Dam No. 2, one of five to be built on the Volga, has been started. The Genissiat dam on the Rhone will soon be under way. The Fuihodo dam on the Yalu river will provide power to operate seven generators with an output of 92,000 kw. each, compared with 82,000 kw. each at Boulder.

THE "CHESTNUT TREE" DANCE, INTRODUCED LATE IN 1938

DANCING. In the ballroom during the year 1938 there has been a decided tendency for British dances to become more sociable. The coming of the "Big Apple" from America in 1937 foreshadowed this, but the very "hot" nature of the music for that dance appealed to only the younger dancers in Great Britain, and a simpler substitute which both young and old could do with ease was found in the "Lambeth Walk." This dance had its origin in a catchy Cockney song of the same name, sung and danced in the review *Me and My Gal* at the Victoria Palace, London This was subsequently adapted for the ballroom, and is performed somewhat in the manner of the old "Barn Dance", with the introduction of conventional Cockney movements. It quickly displaced the "Big Apple", and not only took England by storm, but has been received with equal enthusiasm both on the Continent of Europe and in the United States. It is possibly the first instance on record in modern times of an English "invented" dance finding favour first in the popular dance halls and subsequently in the smartest ballrooms of all countries. Another instance of the desire to add more festiveness to British ballrooms has been the occasional introduction, at all kinds of dances, of the old "Palais Glide", which had a considerable vogue in popular ballrooms in the North of England some years ago. This is even more of a romp than the "Lambeth Walk".

Among more serious dancers, both in Britain and on the Continent, the four standard dances, modern waltz, foxtrot,

tango, and quickstep, continue to dominate the ballroom, though the foxtrot is seldom danced on the crowded small floors of the smart hotel and restaurant The quick or Viennese waltz is increasing in popularity, particularly in the West End of London

For the first time a team of Danish amateurs was able to beat a team of English amateurs in the annual match at Copenhagen. Herr Max Wendt (Germany) was the sole adjudicator. The British amateur championship was won by Mr. Bobbie Israel and Mrs Eirene Browne, and the British professional by Mr Cyril Farmer and Miss Adela Roscoe Both events were held at Blackpool, and the former was again broadcast. The British dancers, Mr. John Wells and Miss Renée Sissons (amateurs), and Mr Arthur Norton and Miss Pat Eaton (professionals), won several international competitions in Germany, where the "English style" is still paramount

During the year the Imperial Society of Teachers of Dancing sent an examiner to conduct ballroom examinations on their behalf in Australia The Royal Academy of Dancing sent an examiner to conduct their "Children's Examinations" in South Africa.

Mr. Alexander Genée, best known in England as the uncle and teacher of Madame Adeline Genée, who in his younger days had established a considerable reputation on the Continent as a dancer and producer, died at Brighton on June 29 in his 89th year. (P J S. R.)

In the United States the year 1938 was marked by an intense and almost feverish exploitation of new dance steps, community and group dancing, and by the importation of foreign dances. For a similar craze in new and wild dance-steps one must go back to 1913 and 1914, when, on the eve of the World War, hitherto conservative ballroom dancers took up such exotic steps as the maxixe, "Bunny Hug", Grizzly Bear", and "Chinese Ta-Tao". There would seem to be some connexion between a period of tension and a sudden popularity in extravagant dances.

Sociologically, the most distinctive phenomenon of 1938 was the continued and even rising popularity of group dances like the "Big Apple", a melange of wild and often spontaneous steps danced to fast swing music by groups of eight or ten people. The "Lambeth Walk" was introduced from England late in the summer of 1938. It leapt into popularity, as a reaction against the undignified jitterbug dances and because of its simplicity made it possible for persons to dance it after ten minutes' instruction Fast as the "Lambeth Walk" rose in favour, it fell just as fast. For one thing, it could only be danced to one song, and the dancers soon tired of it The "Palais Glide", another group ballroom dance from England, made some headway in America.

With the younger generation, the shag, with its dozens of variations, remained the favourite step. Swing bands and racy rhythms held their popularity, and the energetic swing steps stayed on top. The foxtrot and waltz nevertheless remained the basic steps, and the rhumba, the conga, and the tango were as popular as before. Ability to do the rhumba is gradually coming to be considered a necessity on the dance floor.

The sources for new American ballroom dances continue to be enlarged, teachers going to South America for inspiration. Argentina, Brazil, and Chile have all supplied dances, the most remarkable of which is the samba, the national dance of Brazil. The samba is an intricate, graceful, and exciting dance. It is about 110 years old, and was invented by Don Chalasa, a courtier in the court of Dom Pedro, the first emperor of Brazil It is first cousin to the maxixe, also a Brazilian dance, which gained popularity before the War.

DANUBE. On Aug. 18 an agreement was signed at Sinaia between the Powers represented on the European Commission of the Danube, with the exception of Italy (*i e.* Great Britain, France, and Rumania). This made many concessions to demands which had long been pressed by Rumania All authority over the port of Sulina, the technical work at the mouth of the Danube and the inspectorate of navigation, observers, and pilots passed to Rumania. Rumania took over the property of the Commission (boats, dredgers, lighthouses, etc.) and also the service of its loans, the Commission agreeing in compensation to pay Rumania all receipts from navigation for a period of years. Rumania organizes under her Ministry of Air and Navigation a new autonomous service, known as the "Directorate of the Maritime Danube".

In 1938, Germany also opened up negotiations with the other main riparian States to obtain a revision in her favour of the regime controlled by the International Danube Commission (which moved its seat from Vienna to Belgrade). These had not led to any definite result by the end of the year. (C. A. M)

DANZIG. Affairs in Danzig were settled during 1938 by direct Polish-German negotiation instead of by the League of Nations. In a speech early in February, Herr Förster, the Nazi chief in Danzig, said that Berlin had assumed control of Danzig's foreign policy, and that, since the last vestiges of the opposition had disappeared, the Nazi party alone would rule in the Free City. At the meeting of the Volkstag on June 20, to celebrate the fifth anniversary of the Nazi accession to power in Danzig, every deputy wore Nazi uniform, except two Poles ; and the session confirmed the *Gleichschaltung* of all political parties, except the Poles. Throughout the year it was understood that Poland had given up political claims in return for economic concessions. After the summer, fresh difficulties occurred with Poland, especially when many Danzigers went to Germany to share in the autumn manœuvres. On Oct. 10, Förster announced

ASIATIC STATE LIBRARY HYDERABAD (DN)

THE HARBOUR AT DANZIG

that "the Germans in Danzig will soon be rewarded for their suffering, just as the Germans in Austria and the Sudetenland were rewarded". After Oct. 12, the Nuremberg anti-Jewish laws were openly enforced, and the year closed with a feeling that Danzig's reincorporation in the Reich was soon to become a practical issue. (S. H. R.)

D'ARCY, The Most Rev. CHARLES FREDERICK, Archbishop of Armagh and Primate of All Ireland, was born on Jan. 2, 1859, and died on Feb. 1, 1938. After graduating at Dublin University, he became in 1884 curate at St. Thomas's, Belfast. He was subsequently rector of Billy, and later of Ballymena, in Antrim, and in 1900 became vicar and dean of Belfast cathedral. He was bishop of Clogher, 1903–07 ; of Ossory, Ferns, and Leighlin, 1907–11 ; of Down and Connor, 1911–19 ; and archbishop of Dublin, 1919–20. In April 1920 Archbishop D'Arcy was unanimously elected by the bishops to succeed Archbishop Crozier as Archbishop of Armagh and Primate of All Ireland. His publications included *Idealism and Theology*, 1897 (the Donellan Lecture) ; *Christian Ethics and Modern Thought*, 1912 ; *Science and Creation*, 1925 ; *God in Science*, 1931 ; and *The Adventures of a Bishop*, 1934.

DARDANELLES : *see* TURKEY.

DARROW, CLARENCE, American lawyer, was born in Ohio on April 18, 1857, and died on March 13, 1938. After being called to the bar in 1878, he began practising in Chicago, and quickly gained a reputation as counsel for various labour organizations. Among the outstanding cases in which he figured were the trial of Eugene Debs, a Socialist candidate for the presidency, in 1894 ; the arbitration over the anthracite strike in 1902 ; the defence of the Macnamara brothers for a dynamite outrage in 1911 ; the defence of the boy murderers Loeb and Leopold in 1924 ; and the defence in 1925 of J. T. Scopes, the Tennessee schoolmaster, against a charge of teaching evolutionary doctrines.

DARTS. From obscure and crude beginnings in the remote past, this English sport has comparatively recently developed into a highly skilled and sophisticated game. Its chief venue is the public-house, where the various brewers have their leagues and run matches, tournaments, and championships. But the game is also played at the universities and in clubs, etc., and even at church bazaars, while on Dec. 16, 1937, their Majesties each threw a dart at the Social Centre of the new Slough Trading Estate.

The National Darts Association was founded in a North London public-house in 1924. It standardizes the rules for match play, registers the leagues, arranges championships, and generally controls the game. Its organ is the *News of the World*.

In 1938 was founded the "Royal Society of Dartsmen" which, according to its constitution, "is a non-political and entirely irrelevant body to promote good dartsmanship, and to maintain the purity, quality, and strength of beer". It was originated by the Appeal Committee of the London Fever Hospital, and its other object is to raise funds for hospitals. Among members of the governing body of the

London Fever Hospital who have lent their names to it are the Earl of Lytton, Adm.-of-the-Fleet Sir Roger Keyes, A. P. Herbert, M.P., and Leslie Henson; before the end of the year some 110,000 members had joined, and it had raised over £3,000 for the voluntary hospitals. *See* also PUBLIC HOUSE GAMES. (L. H. D)

DAWBER, SIR GUY, British architect, died in London on April 24, 1938, at the age of 76. He received his education and training at King's Lynn (his birthplace), the Royal Academy Schools, and the offices of Sir Thomas Deane in Dublin and Sir Ernest George, R.A., in London. He practised in Gloucestershire and London, but the majority of his work was done as a domestic architect in the provinces. He gave special attention to the design and lay-out of gardens. Dawber was elected A.R.A. in 1927 and R.A. in 1935. In 1928 he was awarded the Royal Gold Medal of the R.I.B.A., and was president of the R.I.B.A. from 1925 to 1927. Recently he was made honorary member of the Royal Society of Painters in Water Colours. He was knighted in 1936. His publications included *Old Houses in Kent and Sussex* and *The Cotswold District.*

DAY, The Most Rev. JOHN GODFREY FITZMAURICE, Archbishop of Armagh and Primate of All Ireland, was born on May 12, 1874, the son of the late bishop of Clogher, and died in Dublin on Sept. 26, 1938. He graduated in Theology at Pembroke College, Cambridge, and was ordained in 1897. After holding curacies at Coventry and Hoxton, he was in India from 1902 to 1909 with the Cambridge Mission to Delhi. He was vicar of St. Ann's, Dublin, 1912–20; canon of Christ Church Cathedral, Dublin, 1914–20; and professor of Pastoral Theology in the University of Dublin, 1917–20. In 1920 he was appointed bishop of Ossory, Ferns, and Leighlin; and on April 27, 1938, the bishops of the Church of Ireland elected him to succeed Dr. D'Arcy as Archbishop of Armagh and Primate of All Ireland. Dr. Day was enthroned on June 9.

DECCAN STATES, in the S. of Bombay presidency, are under the superintendence of the British resident at Kolhapur, the largest principality of the group. Other important members of it are Janjira, Sawantwadi, Bhor, and Sangli. The total area is 10,926 sq. miles, and the pop. nearly 2½ millions.

DE FILIPPI, CAVALIERE FILIPPO, Italian explorer, was born in Turin on April 6, 1869, and died in Florence on Sept. 23, 1938. A brief account of his life and publications may be found in the *Ency. Brit.*, vol. 7, p. 138. To the list of his previous publications he added, in 1932 and 1937 respectively, the two volumes of *Ippolito Desideri of Pistoia, S.J.: His Travels and Account of Tibet, 1712–1727.*

DELHI. This tiny province (only 573 sq. miles in area) was carved out of the Punjab in order to form a surround for New Delhi, the present capital of India, as well as for the historic city of Delhi and the ruins of its numerous forerunners. The magnificent array of buildings which compose New Delhi are now in full working order; but the Governor-General and the staff of the central government move to Simla for the hot and rainy seasons.

DENHAM, SIR EDWARD (BRANDIS), British administrator, was born in 1876, and died in Jamaica on June 2, 1938. He was educated at Malvern College and Merton College, Oxford, and in 1899 was appointed to a cadetship in the Ceylon civil service, in which he laid the foundations of a distinguished administrative career. He subsequently held appointments as colonial secretary in Mauritius, 1920–23, and Kenya, 1923–28; was governor of the Gambia from 1928 to 1930, and of British Guiana from 1930 to 1934; and from 1934 until his death was captain-general and governor-in-chief of Jamaica, in which capacity he showed such outstanding ability and won such popularity that the question was raised of his appointment to a second term of office. His death followed a surgical operation. He was created a K.B.E. in 1927, K.C.M.G. in 1931, and G.C.M.G. in 1935.

DENMARK. Forebodings of the Central European crisis prompted protective deliberations, and in April the Foreign Minister attended a conference of Northern Powers on defence questions. Simultaneously an internal loan of £2,275,000 was floated to establish a reserve of raw materials against emergency. Neutrality also occupied the attention of the seven parties to the Oslo Convention, who met several times to consider its working (*see* NORWAY). Early in the year it was announced that trade with foreign countries showed improvement, but the unemployment figure (200,000) was a record. There was much activity on the part of the German minority in Slesvig and Jutland. A Nazi from Jutland fired a blank charge in the parliamentary gallery and showered pamphlets ridiculing the parliamentary system (April), and the Socialist headquarters in Copenhagen were raided (October). In the domestic arena an important event was the adoption of a new Constitution (June). By it, the Rigsdag consists of 205 members, elected, 171 directly (by adults over 23) and 34 indirectly, for four years, the latter contingent augmented by a further 34, designated by their fellows, to form a First Chamber. On June 30 the 150th anniversary of the farmers' emancipation was celebrated at an exhibition in Copenhagen. In January the Queen underwent an operation; in October the Crown Prince paid a visit to London; and on Oct. 24 the King of Norway arrived to stay with King Christian for the eightieth birthday celebrations of their uncle, Prince Valdemar, last surviving brother of Queen Alexandra. In November attention was attracted to the cyclotron apparatus for producing powerful radio-activity in use in Professor Niels Bohr's Cancer Institute. Denmark led in proposing a common Nordic university. (H. Fw.)

DENTISTRY. During 1938, dentistry has advanced broadly along two lines of investigation into the causes of dental disease.

One line of research has confirmed valuable information about the local environment of the teeth, and extended the hypothesis of the local causation of dental disease. The other approach claims that dental pathology has remote factors for origin, and states that departure from normal health of teeth and their surrounding soft structures must be regarded as symptoms of bodily disharmony rather than merely the result of local tissue breakdown.

Support of the local environment school is given by Professor Box of the Research Foundation of Toronto, who in an exhaustive series of investigations shows tooth decay to be identified with a hydrogen-ion concentration of saliva which makes it decidedly acid. In a large-scale research it was found that a definite relationship existed between the degree of acidity and the incidence of decay.

The Research Group at the University of Michigan reports that increased susceptibility to dental decay is found in mouths where the *lacto-bacillus acidophilus* exists in unusually high counts. This micro-organism lives in an acid medium and ferments starchy food débris remaining about the teeth, the end product being lactic or some allied acid and an increased predisposition to enamel destruction This group has carried out carefully controlled feeding experiments on the children of an institution, and records that on a sugar-free diet tooth decay was arrested, and that with the addition of cane sugar the disease again became active In one section of the experiment, children were allowed an unlimited supply of sugar and confectionery, and in this section the incidence of new decay was very markedly increased.

The same workers found that in cultures made from the saliva of the various groups, the number of colonies of *lacto-bacillus acidophilus* was highest in that group having the greatest incidence of caries

At Northwestern University, Chicago, Hatton and his co-workers have reported a relationship between the numbers of tooth cavities observed, the *lacto-bacillus acidophilus* counted, and a chemical susceptibility test. This test shows that when saliva from a susceptible individual is incubated at 37° C. for a definite time, it exhibits the power of dissolving tooth enamel, which varies with the bacterial count, and is a measure of the individual's susceptibility to tooth decay.

White of Michigan, working on the spectrographic examination of saliva, finds the potassium content to be increased in cases of high susceptibility to dental caries, and this finding has been confirmed by chemical estimation.

In England, the work of Broderick takes a more comprehensive view of the causes of dental disease, and serves to co-relate and explain the data presented by other investigators. This view is that dental diseases result from a "colloidal disequilibrium" of the blood serum, and are associated with a disharmony of the sympathetic nervous system, resulting in an upset of the acid-base balance of the blood. It is claimed that with domination of the sympathetic side of the vegetative nervous mechanism, the colloid particles become "dehydrated", and the acid-base balance is upset to the acid side, resulting in dental caries as a local disturbance.

In "dehydration" the colloid particles tend to disintegrate, some of which go into solution, releasing their quota of mineral salts and other blood constituents, which would account for the raised potassium content of saliva previously quoted Sugar, by its action as a "dehydrating" agent, would aggravate the colloidal disequilibrium, and therefore increase the tendency to tooth destruction.

Conversely, with over-activity of the vagus side of the sympathetic system "hydration" of blood colloids obtains, the acid-base balance is tipped on the alkaline side, and pyorrhœa is the locally observed manifestation.

This theory helps to link up the findings of many researches which hitherto have not been co-ordinated, and by stressing the significance of the change in acid-base balance presents an explanation of the acid saliva which favours the multiplication of acid-loving bacteria, both conditions being constant factors in dental caries.

As this knowledge of the etiologic factors of dental disease increases, methods of controlling and preventing the disbalance which causes it may be expected to evolve, and already considerable advances have been made in the field of dental medicine.

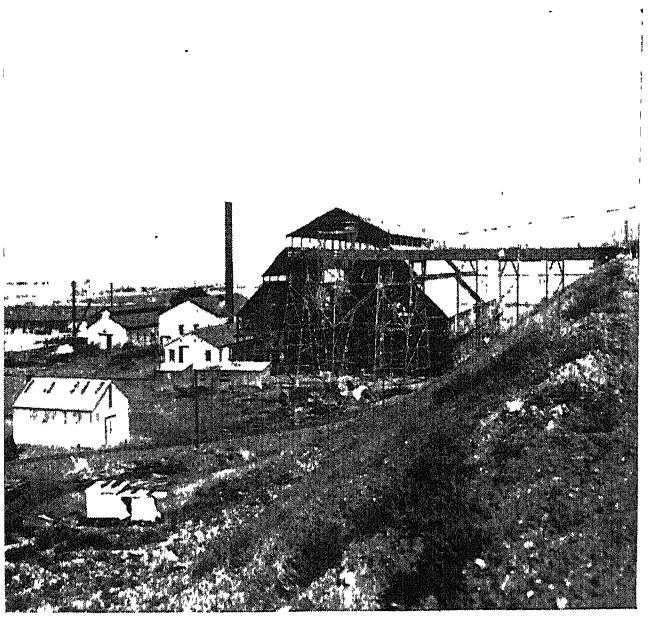
While the progress in operative dental techniques continues, and improvement in the materials employed is noticeable, yet the outstanding advance in 1938 has been the increased interest in the medical aspect of dentistry.

BIBLIOGRAPHY. F. W. Broderick, *Principles of Dental Medicine*; J E. R. McDonagh, *Nature of Disease*; H. Hatton and L. S. Fosdick, *Test for Susceptibility to Dental Caries*; Phillip Jay, *Lacto Bacillus Acidophilus and Dental Caries*. (T. S A.)

DETROIT, in Wayne county, in south-eastern Michigan, and on the Detroit river, the metropolis of the State, and the fourth city in the United States; area, 139·6 sq. miles; population (1937 est.) 1,667,000, of which foreign-born number 399,281 Canadian and British predominate, greatly exceeding in numbers the Polish group, which is second in importance.

During 1937, Detroit experienced an unusual economic recovery, followed by a decided regression which was continued throughout the year 1938. However, there was some evidence of recovery during the latter part of 1938. During the year the industry on which the town depends produced about 2,600,000 cars as compared with about 5 million in the previous year

These wide variations in production and resulting employment had marked effect upon the relief load of Detroit and Wayne county and on the public finances of Detroit. The financial difficulties of the city are aggravated by gradually increasing debt charges which result from the refunding of the municipal debt. Detroit was the largest American city to default, the debt being refunded at a heavy cost in deferred interest.



In 1937 Detroit and Michigan were the centre of "sit-down" strikes, but although their settlement by recognition of the United Automobile Workers and cognate unions by the motor-car companies (except by the Ford Motor Company) served to eliminate major controversies, it did not put an end to numerous unauthorized "slow downs" and strikes which interfered seriously with industry because of the interdependence of one motor manufacturing process upon another.

Obvious discord has raged within the ranks of organized labour employed in the industry, at least as far as management has been concerned. In an exciting "trial" in Detroit, the alleged radical vice-presidents were purged from office but were later reinstated through interventions of national officers of the Committee of Industrial Organization. The feud appears to continue.

DIABETES: *see* ENDOCRINOLOGY.

DIAMONDS. Despite a sharp decline in sales, caused by political uncertainty in Europe and the renewed depression in the United States, the production of diamonds reached a new high record in 1938. Final figures are not yet available, but it may be safely assumed that the output approximated to 10 million metric carats, as compared with 9,550,000 in 1937, when the returns for the principal producing countries were as follows (1936 figures in parentheses): Angola, 626,000 carats (577,000); the Belgian Congo, 4,904,000 (4,634,000); the Gold Coast, 1,170,000 (1,175,000); Sierra Leone, 913,000 (616,000); South-West Africa, 190,000 (185,000); Union of South Africa, 1,027,000 (624,000). In connexion with these figures it should be remembered that the grade of diamonds produced varies as between the different countries, nearly ninety per cent of the output of the Belgian Congo, for instance, being suitable only for industrial purposes.

For the first half of 1938 the South African output was 64 per cent larger than in the corresponding period of 1937, but as restriction was subsequently imposed the increase for the year was comparatively moderate. The marketing and thereby indirectly the output of the principal

Keystone]
NEW CONSTRUCTION PLANT AT A DIAMOND MINE IN KIMBERLEY, S. AFRICA

producing countries continued to be controlled under a quota system by the Diamond Producers' Association, through the Diamond Trading Company, which markets about 95 per cent of the world production and sells it to brokers and diamond-cutting establishments.

For the reasons already mentioned, demand was much smaller than in 1937. Sales of uncut diamonds by the Diamond Trading Company, which had risen from £3,719,000 in 1934 to £9,151,000 in 1937, declined last year to approximately £4 millions, while the sales of cut and polished diamonds by cutting establishments (which are largely concentrated in Amsterdam and Antwerp) fell by over fifty per cent. Though there was consequently a considerable increase in stocks, prices were fairly well maintained around the enhanced levels established early in 1938, thanks to the firm control exercised by the Diamond Producers' Association and also to the existence of an association formed in 1937 for the purpose of bringing about co-ordination between the brokers, cutters, distributors, and retailers throughout the world.

The most important single cause of the decline in sales was the depression in the United States, which normally absorbs over seventy per cent of the total sales. Though the decline in demand particularly affected the gem trade, it extended also to industrial diamonds. This market, which in 1937 accounted for well over sixty per cent of the world's sales by weight, though less than 25 per cent in value, was inevitably affected by the severe recession in the engineering trades, where diamonds are now widely used for cutting and grinding. This field is being constantly extended by diamond research organizations, one of the latest applications being in the form of metal impregnated with diamond dust. (P. F.)

DIBDIN, SIR LEWIS (TONNA), British ecclesiastical lawyer, was born on July 19, 1852, and died at Dormansland, Surrey, on June 12, 1938. He was educated at St. John's College, Cambridge, was called to the bar in 1876, and took silk in 1901. He was chancellor of the dioceses of Rochester (1886–1903), Exeter (1888–1903), and Durham (1891–1903), and from 1903 until 1934 was Dean of the Court of Arches. He was an Ecclesiastical Commissioner from 1931 until his death. One of the most famous of his

decisions was that given against Canon Thompson, vicar of Eaton, Norwich, for having refused the Holy Communion to a married couple on the ground that the wife was her husband's deceased wife's sister Among his publications were *Church Courts*, 1881, *The English Church Law and Divorce*, 1912 (in collaboration with Sir Charles Chadwyck-Healey), and *Establishment in England*, 1932. Sir Lewis was knighted in 1903.

DIETETICS. The most spectacular development in 1938 is the evidence that nicotinic acid cures human pellagra (Smith, Spies, Matthews, De Langen). As the skin, mental, and digestive symptoms are relieved, in some cases neuritis remains. This is usually cured by synthetic vitamin B_1 (thiamin). As the diet of pellagrins is usually incomplete by reason of limitation due to other disease, economic factors, or alcohol, the desirability of adequate diets accompanying and subsequent to treatment with nicotinic acid is stressed by workers in this field. It is reported that nicotinic acid also cures digestive skin and nerve symptoms of young pigs which had been fed on a diet consisting largely of maize (Chick). This diet has long been used to produce experimental black tongue in dogs (Sebrell) The evidence seems clear that human pellagra as generally seen is a deficiency disease due to a lack of nicotinic acid in the diet, but that this deficiency may be accompanied by others such as that of vitamin B_1 (thiamin).

Availability of synthetic vitamin B_1 (thiamin) has made possible continuation of studies of its effectiveness in the treatment of neuritis. Its beneficial effects on the polyneuritis of alcohol addicts has been previously demonstrated; reports are now made of its relief of leprous neuritis (Badger), and that associated with gastric carcinoma (Laurent). Some cases of cardiac dysfunction with œdema have been successfully treated with this vitamin (Jolliffe).

Further evidence of the desirability of more than minimum amounts of vitamin C (ascorbic acid) is given in the marked effects on bone found in protracted mild scurvy (Ham, Elliot). The relation of the vitamin C content of tonsils and blood to the number of hæmolytic streptococci in the tonsils suggests a protective action by this vitamin (Kaiser).

A critical study of Jeans's dark adaptation method for determining vitamin A stores seems to indicate that marked deficiencies may be determined, but it is not certain that mild ones can be (Isaacs, Bocher, Bridgeman, Corlette). Xerophthalmia in infants continues to be reported (May, De Haas) where they have been fed skim milk, some whole-milk dilutions, and even a few breast-fed by malnourished mothers. At the same time no advantage is found in nutritional state or resistance to infection of infants receiving 500–1,050 I.U. of vitamin A depending on age, as compared with approximately 17,000 I.U. (Lewis). Most of the xerophthalmic infants had no vitamin A in their blood. Report is also made of dermatoses in white persons cured by vitamin A (Youmans).

The exact chemical nature of the anti-hæmorrhagic substance, vitamin K, is still unreported. However, workers in several laboratories have found that extracts of either alfalfa (Warner, Brinkhouse, Smith) or fish meal (Butt) are effective in reducing the bleeding time of patients with jaundice to normal levels in a few days (Dam).

Doubts have been cast on any special function of vitamin P (citrin, hesperidin) in guinea-pigs as distinct from ascorbic acid. Favourable clinical reports, however, continue; such as in patients with vitamin deficiencies, petachiæ were reduced by hesperidin independent of ascorbic acid in the diet (Scarborough), and citrin as effective in treatment of Henoch's purpura, after ascorbic acid had failed (Jersild).

Among research of interest on minerals, evidence is presented that growth and bone developments are improved when calcium and phosphorus salts are used to supplement human diets poor in these elements (Coward). However, these salts are recommended only for emergency use when milk is not available (Aykroyd). A sex difference in the utilization of iron is shown by storage of twelve per cent more iron by female than male rats (Rose). The dipyridyl method of chemically determining available iron is not a measure of physiological availability in experiments on anæmic dogs (Hahn, Whipple). Manganese is essential for the bone development of chicks, since both slip tendon and shortened leg bones are prevented by adequate amounts of this mineral (Gallup, Insko). Cobalt, effective in New Zealand bush sickness, also cures pine disease of sheep in the Cheviot hills (Corner).

During 1938, over 100 dietary studies and budget inquiries on diet and nutrition were reported from all over the world.

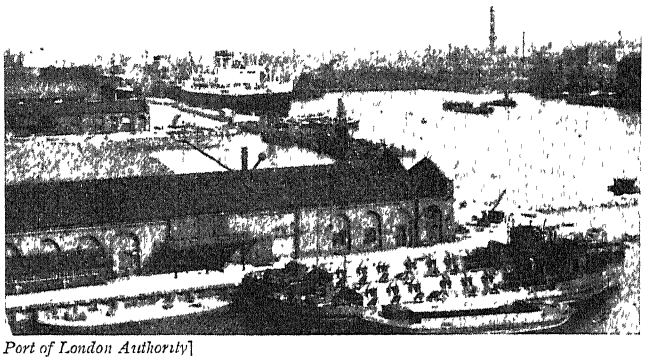
DIVORCE. The past year has given evidence of the working in England and Wales of the Matrimonial Causes Act, 1937, timed to come into force on Jan. 1, 1938. The test is important, because a considerable number of statutes have been curtailed in usefulness by narrow decisions in the Courts. In the case of the present Act, however, judges have on the whole given doubtful points a benevolent interpretation, and, so far as it has not been available for all those whom it was framed to benefit, the fault hardly lies with them. The question, which was much agitated in legal journals in the autumn of 1937, as to whether periods of desertion or insanity previous to 1938 could be pleaded for divorce under the Act, has been answered in the affirmative by all the divorce judges, and at least one decree absolute for incurable insanity has been granted. The Court of Appeal or House of Lords might, of course, reverse this ruling, but this does not now seem likely. Were it reversed, probably a short amending Act would be passed "to resolve doubts", for it would be unfair to grant decrees to some petitioners, and, on the same facts, withhold them from others. An important decision was made in *Herod* v. *Herod*, 54 T.L.R., 1134, [1938] 3 A.E.R., 722, a case in which the petitioner husband sued for divorce on the ground of his wife's desertion, but admitted his own adultery during the period of desertion. The Court held that that adultery was no absolute bar if the wife was ignorant of or uninfluenced by the fact. This must affect a large number of deserted husbands. Again, separation deeds are normally bars to divorce for desertion, but the Court has held in favour of a wife that. when a husband has practically disregarded such a deed and made no payments under it, the Court will also disregard it as against her. Undoubtedly, the chief difficulties which arise under the Act do so in respect of divorce for incurable insanity. Less than three insane persons in two hundred who have been under care and treatment for five years or upwards recover their sanity, but the off-chance remains, and doctors, whose evidence is indispensable, naturally hesitate to risk exorbitant claims for damages for professional negligence in testifying of incurability. Moreover, these cases are so expensive—they must of



course always be defended, and £120 is a low figure—that they are out of the reach of all but the well-to-do classes Indeed, correspondence received by members of parliament and the Divorce Law Reform Union shows clearly that, notwithstanding the " poor persons " procedure, divorce is out of the reach of perhaps the majority of the population, owing to the expense A remedy suggested is the establishment of local Courts of Domestic Relations with divorce jurisdiction.

Elsewhere, possibly the most important development is the Divorce (Scotland) Act, passed on July 29, assimilating the new English law, with the reform that, in cases for divorce for incurable insanity, the Court appoints a " curator ad litem " to defend the case, and obtains a report as to the incurability from the General Board of Control for Scotland Thus the heavy expenses necessary in England are lightened. Scotland has of course admitted divorce for desertion since the Reformation.

On the Continent, General Franco, for the portion of Spain he controls, has repealed the divorce law, which was the first passed after the outlawry of King Alfonso. (A. FEL.)

United States. The committee on resolutions of the American Bar Association, at its annual meeting, refused to endorse a resolution in favour of the Capper-Dickstein proposed constitutional amendment authorizing Congress to pass uniform marriage and divorce laws. The resolution was rejected on the ground that conditions peculiar to different States should be met by State legislation. During the year one decision of great importance regarding divorce procedure was rendered by the United States Supreme Court in the *Davis* v. *Davis* case : The full faith and credit provision of Constitution means that not some but full credit must be given in each State to judicial proceedings of other States. The following grounds for divorce were recognized in individual States : Mississippi, incurable insanity ; Louisiana, continuous separation for two years or more. Ohio, moreover, passed a statute permitting the courts to take into account character and social circumstances in any divorce procedure. The divorce rate over all the United States for 1937 was 1·93 per 1,000 persons, the highest on record, compared with a marriage rate of 11·03 per 1,000.

DOCKS AND HARBOURS. In the British Isles the principal centre of constructional activity has been the capital, where the Port of London Authority is engaged on a development programme of considerable magnitude estimated to cost, in its entirety, some twelve millions sterling. During 1938, they have had in hand, more particularly, a much-needed re-modelling of the Royal Victoria Docks, one of a group of three important docks known as the Royal Docks. The Royal Victoria Dock is the oldest of the three, having been constructed as far back as 1855. Of the other two, the Royal Albert Dock dates from 1880 and the King George V Dock from 1921. The Royal Victoria Dock, as originally designed, was irregular in outline, and, on its northern side, comprised a series of four short jetties, or piers, of solid construction, surmounted by double-storey brick warehouses, having basement vaults ; while between these piers were added later several timber jetties of lighter construction. With lengths of only 450 ft., or less, the brick piers and timber jetties have become too short for modern vessels ; accordingly, they are being removed and a new north quay is being constructed with a total length of 3,250 ft. in a continuous straight line, offering no impediment to the berthage of ships of any length. The south quay has already been reconstructed for a length of 1,750 ft. The bottom of the dock is being deepened by dredging to

Port of London Authority]
ROYAL VICTORIA DOCKS. THE NEW NORTH QUAY IN COURSE OF CONSTRUCTION

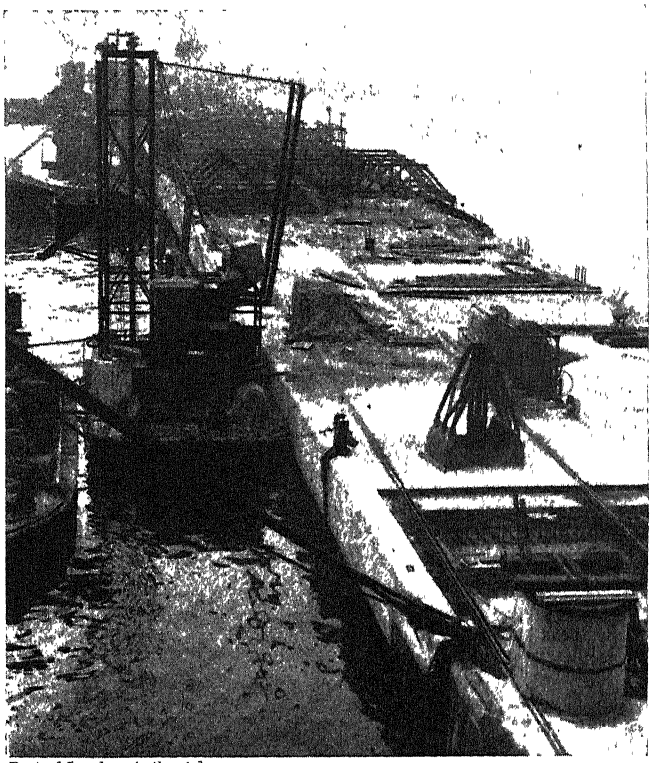
give a depth of water of 31 ft., which is more in accordance with modern requirements. The passage leading to the Royal Albert Dock has also been deepened and a new quay frontage provided on the north side of the Royal Albert Dock, a length of 5,450 ft., affording berthage in 34 ft. of water The programme of improvements includes the modernization of the India and Millwall Docks and a number of minor improvements and additions to the London and St. Katharine Docks, the Surrey Docks, and the Tilbury Docks. The river channel is also receiving attention.

At Liverpool, the Mersey Docks and Harbour Board are engaged in reconstructing the entrance to the West Waterloo Dock with a new lock, 450 ft. long and 65 ft. wide, which will enable coasting vessels drawing up to 17 ft. of water to enter and leave at almost any stage of the tide. A new fish quay at Sunderland, 300 ft. long with 20 ft. depth of water alongside, is practically completed and ready for use. Deepening of the harbour and the channel of the Wear is in hand. At Cardiff an additional general cargo quay, approximately 1,000 ft. in length, is in course of construction in the Bute East Dock. Quay reconstruction is also in progress at Glasgow, and an important addition to the Meadowside Granary at the Rothesay Dock has just been completed. This granary is now among the largest in the kingdom, having a storage capacity of 46,000 tons. At Leith, two new breakwaters are being formed to enclose a considerable area outside the limits of the present harbour, which is now too restricted in extent. Part of the area (about 32 acres) will be reclaimed and the remainder will be dredged.

The year 1938 was specially notable at Southampton as the centenary of the dock system at the port, the foundation-stone of the first dock (originally called the North-East Dock, but now known as the Outer Dock and used exclusively for the cross-Channel steamers of the Southern Railway Company) having been laid with masonic honours on Oct. 12, 1838. From a comparatively insignificant shipping centre, Southampton has risen to the position of premier ocean passenger port of Great Britain, with 32 shipping lines connecting its services with 160 of the world's largest ports. The unveiling of a monument marked the centenary celebrations. There has been considerable development of Southampton harbour as an air base for the Imperial Airways Empire flying boat services, and a stretch of water, one mile in length and 1,200 ft. in breadth in Southampton Water, has been surrendered by the Harbour Board to the Air Ministry for use as a terminal for the Empire air service.

Accommodation for aircraft has also been provided at Belfast harbour where, in March last, Mrs. Neville Chamberlain inaugurated a new aerodrome and airport. An ex-

tension of the Eastern Quay at the Pollock Dock is in hand. At Dublin there has also been continued activity in the extension of the North Quay, the Alexandra Quay, and the East Wall Reclamation Scheme.



France. Various works have been in progress during the year at French ports, notably at Marseilles, where an important scheme of port extension is making good progress In the Bassin de la Joliette, three new oblique jetties have been constructed, together with two new outer breakwaters and the demolition of the former "major traverse". The depth of the basin has been increased to 28 ft A large terminal marine passenger station has been provided on the East Quay for the service of the boat trains. At Bordeaux, the deepening of the entrance channels is in hand with a view to meeting the requirements of a new ocean-going liner, the "Pasteur", which is expected to be in service during 1939 River-deepening operations are also in hand in the estuaries of both the Seine and the Loire. The former of these is an undertaking of considerable importance, estimated to cost a milliard of francs. Further accommodation for overseas traffic is being provided at La Rochelle–Pallice, where a landing quay outside the port of La Pallice has reached a length of over 200 lineal yards, and is being extended to its contemplated length of 330 yards New outer breakwaters are in course of construction at Boulogne; and at Dunkirk a large new entrance lock, 984 ft. long, is at the point of completion.

Italy. In Italy, constructional operations have been in hand in various ports, notably at Genoa, where the new graving dock No. 4, which has a length of 918 ft. capable of extension to 1,150 ft. and a width of 130 ft., is in an advanced stage. The dock is being constructed on a novel principle, by means of a series of hollow pontoons for the side walls which have been floated into position in the harbour and sunk to the required foundation level. At Venice, also, there has been activity in connexion with the development of the industrial port of Maghera. At Naples, another new graving dock, 1,052 ft. long, extensible to 1,284 ft., with an entrance at each end, is in course of construction.

Scandinavia. Miscellaneous programmes of harbour extension works are in progress at various ports in northern Europe, including Helsingfors, Åbo, Stockholm, Gothenberg, Aarhus, and Copenhagen.

Canada. Work in Canadian ports is necessarily concentrated within the slack season for shipping, and during the winter months at the beginning of the year, the National Harbours Board of Canada carried out the reconstruction of the eastern face of the Alexandra Pier at Montreal. This has meant the formation of a length of some 1,260 ft. of new wharfage, which is destined to provide in the centre of the harbour a terminal for the largest liners using the port. The cost of the work runs to over a million dollars (£200,000).

South Africa. One of the most notable constructional enterprises of recent years is that now being undertaken at Capetown, South Africa, where, in place of a much smaller existing enclosure, which has proved inadequate, a great new basin is being formed for shipping with a water area of 290 acres. This new scheme will, in its entirety, including a considerable area of reclamation of the foreshore, involve an outlay of over six millions sterling. At the present time, a massive mole, forty ft. in width, is being formed across Table Bay, to constitute the outer enclosure on the eastern side of the basin, replacing an existing random rubble mound. The new mole is being constructed of steel sheet piling, with a core of sand filling, for a length of 4,050 ft. to its junction with an arm of concrete pile work extending

Port of London Authority]

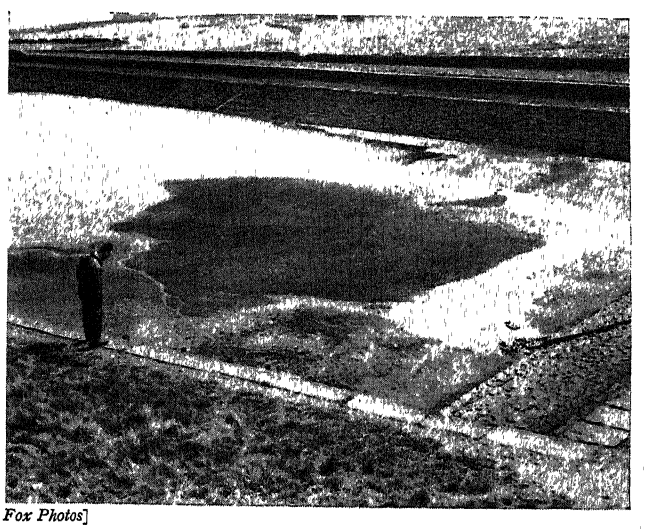
IMPROVEMENT WORK AT THE ROYAL VICTORIA DOCK, SHOWING BUILDINGS TO BE DEMOLISHED AND THE NEW QUAY TO THE ROYAL ALBERT DOCK UNDER CONSTRUCTION

outwards for a distance of 2,500 ft. from the Woodstock end of the bay. The mole is to serve as the skeleton for a future quay, prior to the completion of which about a dozen short or "stub" jetties, where ships can be moored in emergency, will be provided on the inner side. It is expected that the length of sheet-piled jetty will be completed early in 1939. Included in the scheme is a huge graving dock, some 1,200 to 1,300 ft. in length, estimated to cost a million pounds, to be constructed within the reclaimed area. In addition, there is a considerable quantity of dredging work to be done, both in sand and rock. The enterprise was inaugurated on the night of May 10, when the Prime Minister of the Union of South Africa, General Hertzog, set in motion the machinery of a dredger to the accompaniment of the switching-on of a thousand electric lights outlining the new harbour area. (B. Cu.)

In the United States, approximately 1,000 river and harbour projects were in force on June 30, 1938, and active operations were under way on over one-third of the total.

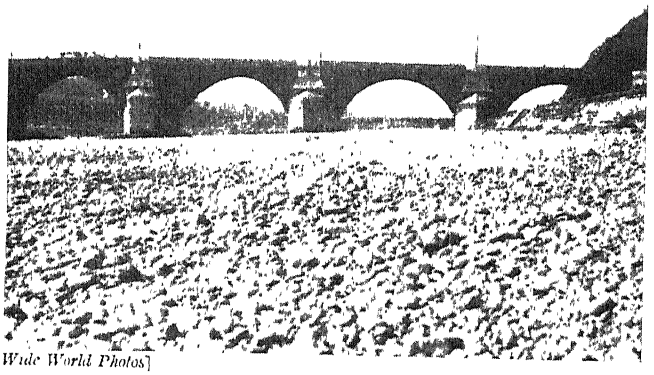
The more important projects recently approved by Congress include dredging of the channel in Delaware river to increase the project depth from 35 to 40 ft. between Philadelphia, Pa., and the sea; increase in project depth of that part of the intracoastal waterway between Savannah, Ga., and the St. John's river from eight ft. to twelve ft. to conform with that part of the waterway between Norfolk, Va., and Savannah, Ga.; enlargement of the turning basin at Port Everglades, Fla., to relieve congestion in that growing port; widening the channel in the Mississippi river at New Orleans, La., and between New Orleans and Baton Rouge, La.; extension of channels and turning basin at Corpus Christi, Texas, to accommodate the increasing commerce of that port; widening and deepening channels of the Sabine-Neches waterway in Texas to improve navigation to the cities of Port Arthur, Beaumont, and Orange.

DOMINICAN REPUBLIC, a West Indian republic occupying the eastern two-thirds of Hispaniola; language, Spanish; capital, Ciudad Trujillo; president, Dr Jacinto B Peynado. Area 19,325 sq. miles; population (1935 census) 1,479,417, official estimate 1,581,248 in 1937, predominantly mulatto and Negro, but whites are politically important The chief cities are· Ciudad Trujillo (formerly Santo Domingo), the oldest European-founded city in America, 71,297, and Santiago de los Caballeros, 33,919 In January 1938, a pact with Haiti was signed adjusting the difficulties between the two countries which had arisen in 1937 Under its terms Haiti was given an indemnity of $750,000 (*see* HAITI). In May, Dr Jacinto B Peynado was elected without opposition to succeed Rafael L Trujillo Molina, president since 1930, and was inaugurated on August 16. The republic has good external communications by steamship and air; there are 166 miles of government-owned railway, supplemented by a highway network of 873 miles In addition 610 miles of railway are in use on sugar estates.



Imports in 1937 totalled $11,691,896 (principally textiles, machinery, and structural materials), a 21 per cent increase over 1936, from the United States (52·3 per cent), Japan (13 per cent), Germany (8 per cent), and Great Britain (7 per cent). Exports increased 19·7 per cent in 1937, totalling $18,128,732, the highest value since 1930, and went largely to the United States (32·7 per cent), Great Britain (31·8 per cent), and France (13·7 per cent). Exports for the first nine months of 1938 were valued at $13,368,998, a decline of 20·6 per cent. The Dominican Republic is primarily agricultural, with sugar the most important crop, and cacao, in which it ranks fourth in world production, second. The monetary unit is the peso, equal in value to the U.S dollar. Fiscal control is in the hands of a financial adviser and general receiver of customs nominated by the President of the United States. In 1937 there were 900 public and private primary and secondary schools, with an enrolment of 113,530. (L. W. BE.)

DONATIONS AND BEQUESTS. Lord Nuffield's benefactions in Great Britain included £80,000 for Guy's Hospital Nurses' Home, and £50,000 to the Boy Scouts' Association, both upon terms; £60,000 to Birmingham University (for Physics Block); £50,000 each to the Territorial Association Sports Fund, and to the London Students' Union for building, £25,000 for Student Movement House; £20,000 to Banbury Hospital; £10,000 to London Hospital; and five thousand "iron lungs" for hospitals throughout the British Empire. Hospitals benefited included Great Ormond Street (C. P. Johnson, ultimately £75,000), Guy's (Mrs. E. L. Stroyan, £10,000, F. Lindo, £75,000), London (J. H. Stephens, £10,000), Royal Cancer (A. C. Beatty, £50,000 for research), St. George's (H Oakes, £80,000), and St Mary's (J. H. Stephens, £10,000), Bishop's Stortford (Mrs. Stroyan, £10,000), and Swansea (Capt B. H. Freeman, £15,000). Other legacies were received by Clacton (St. Michael's Crippled Girls' Home, £10,000, by Miss W. M. B de la Chere), and Liverpool (Council for Social Service, by A. B. Earle; Orphanage, £17,000, by J. W. Dart). Mr. and Mrs. Haughton gave £25,000 to N Staffs. Infirmary. Educational bequests were made to the following universities: Cambridge (the University, classical archæology, by Dame M. G. Sandys; King's, drama, by Miss Gertrude Kingston; Pembroke, divinity, by J. I. C. Boger, also Rev. C. G. Wilkinson); Edinburgh, medical-surgical research, by J. Risk; Oxford (the University, Egyptology, etc., by Mrs. N. Griffith; Balliol, by P. Hide; Queen's, zoology, by E. T Browne). Epsom College received £20,000 (reversion) from H. B. Densham; Sevenoaks Grammar School, £75,000 (ultimate) from C. P. Johnson To reduce the National Debt, A. J. Grave left £150,000, J. M. Brown, £25,000, and J. Dennistoun, £20,000.



Bequests to museums included· British Museum (Lord Rothschild, zoological specimens, books, and Tring museum), London Library (Dr. C J. Goldsmid-Montefiore, pamphlets), National Gallery (R. H. Williamson, pictures), Victoria and Albert Museum (Duke of Norfolk, panelling, etc., from Norfolk House). To Coventry, Sir A Herbert gave £100,000 for art gallery, etc.; to London (Tower Hill Fund), Lord Wakefield gave £32,000; to Stratford-on-Avon, P. Baker perpetuated Hathaway Farm as a pleasure-resort; and to the Welsh Nation, C G Treherne, Duffryn House, near Cardiff In Africa, Miss F. C. Peace left £7,000 to Durban Government Hospital and Lord Nuffield gave £100,000 for orthopædic services; in Australia, H. Spensley, bronzes, etc, to the government of Victoria, also Bedfordshire Mansion for the use of the High Commissioner of Australia in London, and Sir C. McNess, £10,000 to the Presbyterian Church in Western Australia (*See* also FOUNDATIONS AND TRUSTS) (H Fw.)

United States. The number of newly established foundations, endowments, and trust funds organized for the benefit of the public continued to grow during the year. Complete information is nowhere available as to the total now chartered, but they run close to 290. Large bequests announced in 1938 include: a trust fund of $2 millions for the Art Institute of Chicago, and $1 million for a memorial in Chicago to Alexander Hamilton, both given by Kate S. Buckingham of Chicago; about $1 million given to Harvard University by Mrs. Agnes Wahl Nieman of Milwaukee, to provide fellowships for experienced newspaper men; $1 million for research in and treatment of diabetes, given by Emelie Renziehausen of Pittsburgh; $1 million to benefit undernourished and underprivileged children, by Charles H Hood of Massachusetts; and $750,000 given by William H. Crocker of California, the income to be devoted to religious, charitable, and educational purposes.

DROUGHT. Each continent of the earth has within its boundaries one or more regions of such geographic position and topography that they are normally subject to periods of aridity or semi-aridity. In these regions droughts are not unexpected, although they vary in fre-

Fox Photos]

Wide World Photos]

THE RHONE BED AT LYONS ALMOST DRY, MAY 21, 1938

quency, duration, and intensity Drought, however, frequently strikes regions where prolonged periods of dry weather are neither normal nor expected

During 1938, droughts were not unusually severe or widespread in regions of normal drought expectancy but did cause considerable damage in areas where dry weather is of infrequent occurrence. Rainfall shortage over most of the earth's surface was most acute during the early spring and during the month of October.

Throughout the British Isles, drought conditions were especially acute in the early spring. During the three months ending on April 1, rainfall was 58 per cent below normal. This unprecedented shortage caused extensive damage on farms in England and Wales. Heavy rains coming in early May were offset by a succession of frosty nights during the latter part of the month.

All crops were below average. The blight was particularly severe in the fruit-growing sections. In Lincolnshire the strawberry crop was almost wiped out, while the yield in Hampshire—less than a quarter of the normal crop for this county—was the lightest in the history of the industry. Pastures were so thin that hundreds of sheep died for lack of food and farmers were forced to sell their animals or graze them in wheat-fields.

Most of Europe suffered to some degree from the effects of the abnormally dry spring. Harvesting, especially of spring grains, was delayed in almost all countries on the Continent.

Moisture shortage was critical in the Scandinavian countries and in the northern part of France, where growing grains were rather badly damaged. Switzerland experienced an unbroken period of 70 rainless days.

Rains which broke the drought over most of the Continent in late May and early June effected a marked recovery in the wheat crop in Italy where a twenty per cent to forty per cent decrease in total crops had been anticipated. Serious damage was done, however, before the drought was broken.

In the Mediterranean basin a combination of heat and drought during the summer months affected grain and fruit yields, particularly durum wheat in Algeria and Tunisia, wheat and barley in French Morocco, and the fig crop in Turkey. Unusually dry weather was also prevalent during July and August in both Bulgaria and Rumania.

In almost all parts of the U.S.S.R. the growth of winter grains was retarded by deficient snowfall and lack of ground moisture during the winter months. Spring cereals also suffered in the east and south, and in the important spring wheat section of Asiatic Russia, because of extreme heat and drought that lasted from the early months of the year through late summer. Hot, dry winds shattered the grain, pastures were damaged severely, and the year's hay crop was considerably below normal.

Rainfall was also scarce in India during the spring and late autumn. The Union of South Africa banned the export of corn and sugar early in the year because of serious drought conditions which delayed planting and made the outlook for the year's crop production uncertain.

The latter half of the year was generally dry in Australia, and heavy rains in July were too late to produce more than a mediocre stand of wheat in the west. By November, forage supplies were so depleted that it was necessary to cut some wheat acreage for hay.

Moisture conditions over most of the western hemisphere were much better in 1938 than in 1937. The Canadian prairie provinces suffered little from the lack of rain. Good growing conditions prevailed generally throughout the United States until autumn, when a severe and widespread drought extended from the Appalachian to the Rocky mountains, bringing early seeding to a standstill and causing sharp deterioration of late-planted grain in many sections. Rain and snow early in November ended the dry period.

Spring droughts in Cuba, Puerto Rico, Bermuda, and the Bahamas were broken in June after fruit and vegetable crops had been injured. Drought was not an acute problem in South America. In the Argentine, the 1938–39 wheat yield was expected to be the second largest in the country's history. Conditions in late 1937 and the early part of 1938, however, produced a severe shortage in the 1937–38 harvests of grain, corn, flax, and cotton. (*See* also DUST STORMS.)

DRUGS AND DRUG TRAFFIC. Two main questions have been dealt with by the League of Nations:

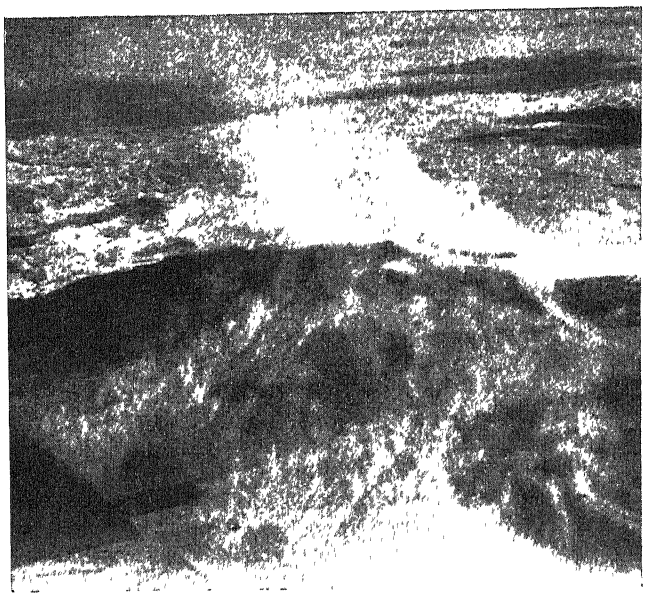
(i) *The limitation of poppy cultivation.*—The Advisory Committee began to prepare for the limitation of the raw material of opium and its alkaloids. Poppy cultivation is not limited in relation to world consumption, though some states, such as India, Turkey, and Yugoslavia, produce under government monopoly. The world's annual needs, as legally recognized, are some 300 tons of opium for narcotics, 300 for opium-smoking monopolies, 500 for eating. In 1936, 2,300 tons were produced, and 3,500 tons were in stock, not counting China and Afghanistan. The committee proposed that poppy growing for opium, and raw opium, should be limited, and poppy plants, used to make alkaloids in Hungary and Poland, should be controlled. Importing countries should estimate for their needs; producing countries should limit their production to the amount allocated by an international authority. The method of allocation remained for a conference to settle.

(ii) *The Far-Eastern situation.*—China, the United States, and Canada brought accusations of encouraging drug-traffic against the Japanese authorities in China. The "Manchukuo" monopoly increased poppy growing in north China, imported opium from Iran and Korea, and allowed unrestricted sale. The Harbin authorities reported 1,500 drug-poisoned corpses picked up in the streets in seven months of 1937. Tientsin was the world centre of heroin-traffic. Egypt cited 181 towns of Manchuria and Jehol with 12,000 licensed opium and heroin dens. The United States said one gang imported 650 kg. of heroin

from Tientsin to America, two-thirds the annual medical needs of the world. The traffic at Shanghai was controlled, on behalf of the Japanese army, by a colonel. Portuguese Macao was serving as the entrepôt for illicit opium from Iran. Japan denied all these allegations. The League Committee and the Assembly were not satisfied, and protested to the Japanese government This situation endangers the world control of dangerous drugs.

(F. WHI)

DUHAMEL, GEORGES (1884–), French writer, of whom a biographical notice will be found in the *Ency. Brit*, vol. 7, p 719. The son of a doctor, he took a medical degree in 1909, was married in the same year to Mlle Blanche Albane, and has three sons. His *Civilisation* (1918), in which many of his war impressions are recounted, gained him the Goncourt prize, and from 1919 onwards he devoted himself entirely to the profession of letters, travelling extensively, lecturing in Russia in 1927, and in the following year in North America, the latter visit giving rise to *Scènes de la Vie Future* (Grand Prix Académie Française, 1930). Director of the *Mercure de France* from 1935 until 1938, he has been a member of the Académie de Médecine, and president of the Alliance Française since 1937, the year he received the title of Docteur Honoris Causa from Amsterdam university. One of the foremost living writers, Georges Duhamel may be described as the Balzac of modern French letters—indeed, some of his characters have already become almost as well known and beloved in France as those of his famous predecessor Among English translations are: *America the Menace*; *News from Havre*; *Young Pasquier*; *In Sight of the Promised Land*; *Salavin*; and *In Defence of Letters* (1938). In January 1938 he published *Au Chevet de la Civilisation*, and in October the seventh volume of the Pasquier series, *Cécile parmi nous*.



DUST STORMS may or may not represent land damage, according to their source. In inhabited regions, they are likely to be the manifestations of soil erosion by wind on agricultural land. In generally uninhabited regions, such as deserts and scab lands, the dust storms may represent only the aerial redistribution of soil particles from one locality to another, without any particular attendant damage. Wherever they occur dust storms are a symbol of aridity and a corollary of drought, for dry, powdery soil or sand is a prerequisite of a dust storm.

In arid or semi-arid agricultural regions, such storms tend to follow the removal of vegetation which normally protects and ties down the soil. In desert regions and other areas of arid climate and scant vegetation, the storms are virtually seasonal occurrences. In regions of either type, however, they vary with the velocity of the wind and the intensity of drought. Thus, a combination of unprotected dry soil, wind, and prolonged aridity normally may be expected to produce a dust storm.

On the North American continent, where some of the world's most severe and damaging dust storms have occurred in recent years, soil blowing during 1938 was comparatively mild.

The Northern Great Plains of the United States and the prairie provinces of Canada suffered little from high winds, largely because of improved moisture conditions.

In the so-called "Dust Bowl" region in the Southern Plains of the United States, soil moisture was considerably below normal over the winter and numerous severe dust storms occurred early in the spring. During May, however, abundant precipitation fell over most of the "Dust Bowl" region and soil blowing was not severe from that time on,

Wide World Photos]

AERIAL VIEW OF DUST STORM TAKING UP THE TOP SOIL OF MONTANA FARM LANDS

although occasional minor dust storms caused some hardship throughout the year. At the close of 1938, this region was in its best condition since 1933, due to favourable moisture conditions and a greater density of vegetative cover.

In June, Japan's Hokkaido island experienced one of the most severe dust storms in its history. Some 75,000 acres of land were covered with an inch of sand and silt, and approximately 80 per cent ruined for harvesting. On April 16, a dense sandstorm delayed all shipping in the Suez canal. India's customary blowing periods preceded and followed the south-west monsoon.

During the spring drought in the British Isles, clouds of dust blew across the Yorkshire plains; and in some parts of Scotland, notably at Montrose, visibility was reduced as far as the coast. Four inches of soil covered roads in some sections, and soil drifts a foot or more in height were reported

The northern half of the Anglo-Egyptian Sudan, the Sahara, and other arid or desert regions of Africa again experienced severe sand and dust storms, though these were not unexpected, since such storms have become periodic in these regions.

In other parts of the world less severe and less frequent dust storms were reported, their intensity and frequency varying with the intensity of drought and the degree of agricultural activity. Length of agricultural occupation is almost invariably a determining factor in the potentiality of dust storms in a given drought region. (*See* also DROUGHT.)

DUTCH LITERATURE. Since the revival of Dutch poetry about 1880 the lyric has been flourishing in the Netherlands. This lyrical gift is remarkable in a people often, and in many respects justly, called level-headed. The combination of level-headedness and lyric talent is a quality which the Dutch people have in common with the English. One may probably account for this apparent contradiction by considering the self-restraint, characteristic of so-called phlegmatic peoples, which particularly enables them to control their human emotions perfectly, compelling and perpetuating these in words and imagery, without falling into either extravagance or pathos. The dynamic

power of the inspired imagination is complemented or tempered, as the case may be, by a strong sense of reality.

In the year 1938 Dutch literature suffered the loss of its oldest and finest lyric poet, Willem Kloos, who, nearly eighty years old, was honoured by both the younger and older generation in the land as the ardent poet of immortal sonnets in his youth. These sonnets were, after such an impetuous outburst, never quite equalled by his later work, but nevertheless remained sufficiently impressive to ensure him enduring fame as the most passionate Dutch lyric poet and the renewer of modern Dutch literature. Every later poet owes, either directly or indirectly, something of his development to Kloos' formative influence.

Important events were the two monumental publications which appeared in 1938. In the first place there was the collected work, in two volumes, of a younger contemporary of Willem Kloos, Albert Verwey, who devoted his life as poet, thinker, literary historian, founder of several journals, and in his later years as professor of literature in Leyden, to a continual and grand defence of poetry, at all times fulfilling a leading part in the intellectual life of his people. Secondly may be mentioned the provisionally collected work in three volumes, poetry, prose, and critical studies, of H. Marsman, a romanticist who is inspired by a strong vitality and the desire to live really freely and greatly. Now almost forty years old, he is still a stimulating example to younger poets.

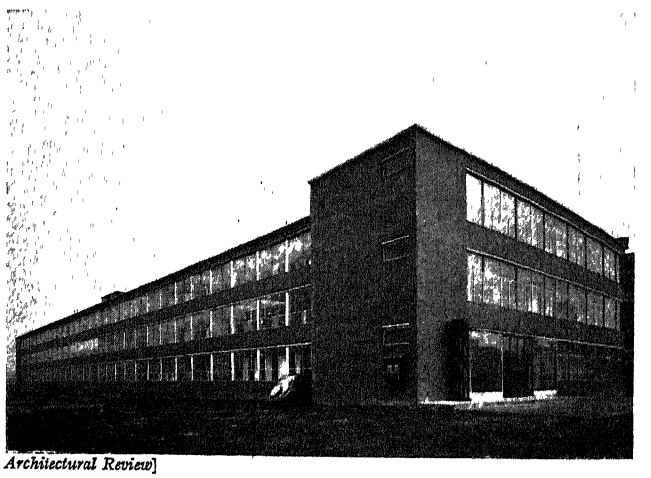
In preparation are the collected poems of an early deceased contemporary of Marsman, Jan Slauerhoff, who as ship's surgeon, sailing the seven seas in his work, both lyric and prose, was a type of the "pilgrim of eternity". Of the lyrical poets, now in the fifties, who this year enriched Dutch poetry, special mention may be made of A. Roland Holst, J. C. Bloem, and M. Nijhoff. A younger generation established at the beginning of the new year their own journal, *Werk*, of which one may justly foster expectations.

A great number of novels were also published in 1938. In this connexion the following authors especially distinguished themselves: the sober and, *par excellence*, Dutch narrator, Arthur van Schendel, whose novel *Het Fregatschip Johanna Maria*, published a few years ago, is also known in an English translation; the productive younger writer S. Vestdijk, who has in recent years interested himself in the historical novel; and the tense and austere stylist F. Bordewijk, with a recent novel *Karakter*. Further may be mentioned the harrowing yet intensely concise work of the Fleming Elsschot (*Het Been*), and the vivid rural novels of A. Coolen and Th. de Vries. The younger generation excels, not only in lyrical poetry, but also in the dialectical essay, in which it actively takes part in the discussion of the future of European life and thought. Of interest in this connexion is the in many respects complementary work of the "independent" Menno ter Braak (*Van Oude en Nieuwe Christenen*) and that of the Catholic writer Anton van Duinkerken (*Verscheurde Christenheid*). (A. D.)

DYESTUFFS. The world production of dyestuffs shows a steady increase over a period of many years. This increase may have received a check in 1938, due to a general falling off in trade activity, but unfortunately complete figures are not available for that year or even for 1937. The following table, however, gives a good picture of the trend of events from 1925 to 1936. The total figure for 1936 is incomplete, as it does not include a few countries, such as Italy, which have a small production of dyestuffs.

The production of Great Britain in 1937 was 28,243 tons, showing an increase over 1936. Germany's production

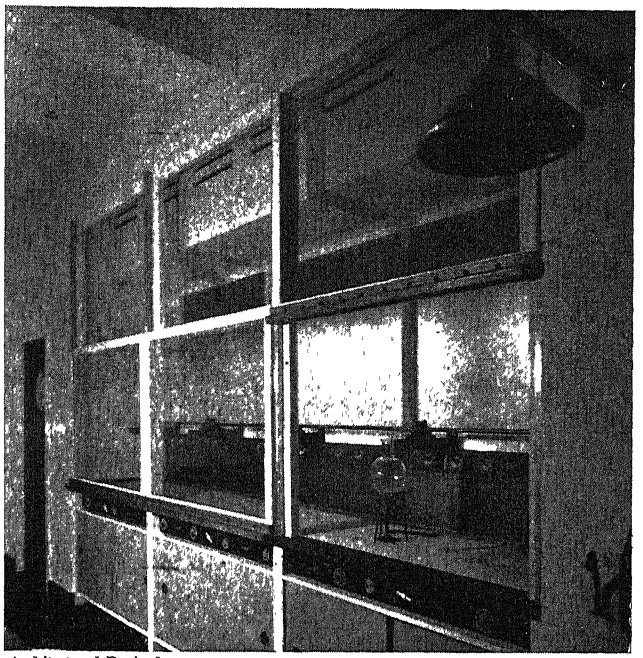
Production of Dyestuffs, 1925-36



Country	Production in tons	
	1925	1936
Germany	72,000	73,828
United States	38,000	53,229
Great Britain	15,000	27,323
France	16,000	12,210
Switzerland	9,000	7,503
Other Countries	15,000	—
Japan	—	19,065
Soviet Russia	—	25,594
Totals	165,000	218,752

remains comparatively stationary; the most significant figures in the table are the rapid growth of Japan and Soviet Russia as dye-producing countries and the expansion of British and American production. It is to be noted, however, that the products of Japan and Russia are largely the cheaper, less difficult dyes; and that the Swiss production, though comparatively small, consists largely of high-grade specialities, for export. The following table gives the export figures of the principal producing countries for 1936

Exports of Dyestuffs, 1936



Country.	Tons.	Value.
Germany	33,203	RM.135,092,000
United States	7,771	$6,080,735
Switzerland	7,766	Frs.74,588,697
Japan	6,999	Yen.5,990,178
Great Britain	5,143	£1,236,901

The record of progress in the synthetic dyestuff industry is given, however, not by production figures, but by the new and improved dyestuffs made available by intensive research. The leaders in this respect are the big dyestuff firms of Germany, Switzerland, and Great Britain, and a large number of patents are secured every year by these firms for the manufacture of new dyes. Research is mainly directed to securing a greater degree of fastness in colouring matters to the various processes and agencies to which dyed goods are subjected. Most attention is being paid at the present time to the development of dyes from anthraquinone and other polycyclic systems, and to azo dyes of special types. The German I.G. (Interessen Gemeinschaft Farbenindustrie A.-G.) have added several new members to

Architectural Review]

Architectural Review]

A FUME CUPBOARD AT THE BLACKLEY LABORATORIES, MANCHESTER, WITH WIRED SAFETY GLASS AND OUTSIDE CONTROLS SET BACK TO AVOID INTERFERENCE

their Indanthrene range of fast vat dyes in the past year, and the Society of Chemical Industry in Basle have likewise extended their range of Ciba and Cibanone dyes. Imperial Chemical Industries of Great Britain have introduced a new range of very fast dyes for wool, having hitherto unknown fastness to washing and to light, called Carbolan dyes.

There is also great activity in developing the so-called ice colours for cotton, these colours being formed by coupling a phenolic compound on the fibre with a diazo compound. Up to recently the phenolic component used was always a derivative of 2-naphthol-3-carboxylic anilide, giving a limited range of shades, but recently the use of other ring systems than napthalene, *e.g.* carbazole, has been tried with success, especially for brown shades. Much attention is being given to the improvement of dyes for rayon, especially acetate rayon, and recently I C I. have introduced a new range of water-soluble dyes—Solacet dyes—for this purpose. Before this innovation, the best dyes for acetate rayon were insoluble and had to be applied from a fine dispersion.

The most spectacular development of recent years is the discovery of the Phthalocyanine pigments by I.C.I. and R P Linstead. These are of an entirely new chemical class. The first member put on the market was Monastral Fast Blue BS, which has the following structure :

This is the fastest blue organic pigment known, and it has now been supplemented (1938) by a green—a chlorinated derivative—of equal fastness. New developments of this series of dyes may be expected.

See *Annual Reports of the Progress of Applied Chemistry*, pub. by the Soc. of Chem. Industry, London. (E. H. R.)

DYSON, WILLIAM HENRY, Australian cartoonist, was born at Ballarat, Victoria, in 1883, and died on Jan. 21, 1938. After working for the *Melbourne Punch* and the *Sydney Bulletin*, he came to England, and established his reputation with his political cartoons for the *Daily Herald*, in which the great vitality of his draughtsmanship and of his political leanings were alike exhibited.

E

EAR, NOSE, AND THROAT, DISEASES OF. Of recent years many important advances have been recorded in the diagnosis and treatment of diseases of the ear, nose, and throat. The following are of particular interest because of the frequency with which they are encountered in all parts of the world.

Deafness. The introduction of the wireless valve in miniature form has resulted in a very great improvement in the performance of hearing aids. A modern valve-amplified aid incorporates miniature valves, small storage batteries, and is easily portable. It is capable of amplifying with reasonable accuracy all speech sounds, and in some cases can transmit sounds as high as 8,000 cycles per second. This class of aid has been shown to be suitable for all types of deafness, and its continued use may, by exercising the hearing apparatus, hinder the progress of the deafness. P. M. T. Kerridge has described the way in which a hearing-aid clinic for hospital patients can be administered, and has given a lead that can, with advantage to the hard of hearing, be followed by other hospital centres.

Recent reports by G. Holmgren and M. Sourdille indicate that in progressive deafness due to otosclerosis great improvement in the hearing can be expected from operative treatment. A small window is made in one or more of the bony semicircular canals, and whilst this window remains patent, the improvement in hearing is maintained and the accompanying head noises may be relieved. So far it has not been possible to prevent new bone from gradually forming and closing the window, and until this can be done a guarantee of permanent improvement in the hearing cannot be given.

The increase of noise that appears to be an inevitable accompaniment of this age of mechanization may result in premature deafness for those who are frequently exposed to noises of high intensity. In an excellent review of the subject, C. C. Bunch has described the results that have been noted in testing the hearing of workers in noisy occupations. Such workers show a loss of hearing, especially for high tones, and the time may not be far distant when they may be required to wear some form of noise-insulating apparatus whilst at work.

Nasal Catarrh. This term is generally used to describe the principal symptoms of nasal disease, namely, nasal obstruction and nasal or post-nasal discharge. Such symptoms are usually the result of irritation or infection of the mucous membrane lining the nasal passages. Irritation is caused by the nasal mucous membrane being sensitive to certain forms of dust particles in the inhaled air. Allergic rhinitis is the term generally used to describe the cases due to irritation, and this includes hay fever, vasomotor rhinitis, paroxysmal sneezing and rhinorrhœa and many of the cases of variable nasal obstruction. Treatment is directed either towards removal of the irritant or towards rendering the patient less sensitive. The exciting agent, whether it be inhaled (dust) or ingested (food), may be avoided, or, as this is often not possible, repeated injections of small quantities of the irritating dust or offending article of diet may desensitize the patient. The predisposing factor of sensitiveness may be attacked by treating the sensitive nasal mucous membrane. Cauterization, submucous injection of sclerosing fluids, and zinc ionization all have their advocates, and one or other measure may be employed in conjunction with general measures when removal or neutralization of the exciting factor is not effective or possible. An exhaustive monograph covering every branch of the subject has recently been published by F. K. Mansel.

The chief example of infective rhinitis is the common cold, and it is to this that most of the remaining cases of infective rhinitis owe their origin. Strong evidence has been brought forward by Docker and others to show that the common cold is primarily due to an unknown virus. This alters the bactericidal power of the nasal mucus (Hilding), and thus enables any pathogenic organisms that may be present in the neighbourhood to gain a foothold and cause a secondary infection. It is this secondary infection that causes the complications, not only locally in the nose, but also in the lower part of the respiratory tract. The problem of the common cold is then a double one, namely, the avoidance of the virus infection and the prevention of the secondary infection. In conditions of modern civilization with its overcrowding, the avoidance of the virus does not seem possible. The secondary infection can be largely modified by active measures in the primary stage, and also possibly by building up a resistance to the secondary infecting organisms by means of a vaccine, and ensuring an adequate supply of vitamins.

Nasal polypi may result from irritation or infection, and are frequently the result of both factors being present in the nose simultaneously. They are treated by removal, and unless the polypus-bearing area is thoroughly eradicated they may recur. In order to lessen the chance of recurrence, Lyons suggested that small quantities of radium should be applied to the ethmoid region for short periods after removal of polypi. Several observers have since reported on the value of this method in suitable cases.

Tonsils and Adenoids. There has been considerable controversy over the subject of removal of the tonsils, especially in children, but all authorities seem to agree that, given the proper indication, complete removal of the tonsils is rarely attended by any but beneficial results (Kaiser, Glover). The absolute indication for tonsillectomy is recurrent attacks of tonsillitis, whilst in children the presence of enlarged cervical glands may be taken as an important indication. Certain manifestations of focal sepsis, namely nephritis, infective arthritis, and certain eye conditions, seem frequently to owe their origin to infected tonsils, whose removal may arrest the progress of the disease.

In children there is always a mass of adenoid tissue in the nasopharynx. This should start to shrink at puberty, and has usually disappeared by the time adult life is reached. During the early days of childhood, repeated nasopharyngeal infection may cause enlargement and permanent infection of this adenoid mass, so that its removal may be necessary to avoid or overcome the results of obstruction or infection of the nasal or ear passages. Also recurrent infection of the lower respiratory tract may be caused by adenoids, and it is possible that infected adenoids play a

more important part in the causation of ill-health in childhood than the tonsils.

Epidem. and State Med.*), Aug. 1938 (p 1219). (T. C.)

EARTHQUAKES: *see* SEISMOLOGY.

EASTERN CHURCHES. The following observations may be made upon the circumstances during 1938 of certain of the autokephalous Eastern Orthodox Churches.

(1) **The Patriarchate of Jerusalem** remains incapable of action owing to the deadlock caused by the demands of the arabophobe Orthodox, and to the inability of the High Commissioner to confirm the election of the Patriarch Timotheos until those demands are satisfied. The state of Palestine, and the closing of the Church of the Holy Sepulchre as in danger of collapse, have brought pilgrimage to a standstill. The partition of Palestine was strongly opposed by the Orthodox.

(2) **The Church of Cyprus** is still without an archbishop, Bishop Leontios of Paphos, the *locum tenens*, refusing, in spite of pressure from the Governor and the advice of the Œcumenical Patriarch, to take the steps necessary for an election.

(3) Facts concerning the **Patriarchate of Russia** are hard to ascertain. Many bishops and priests appear to have been executed during the recent purge; but the evidence available points to the Church more than holding its own. It is reported that there were 5,000 Easter worshippers in Moscow. In August the Council of Russian Bishops in Exile held an important assembly of clergy and laity at Karlovçi, near Belgrade. In the jurisdiction of the Metropolitan Evlogie a commission rejected a charge of heresy against Father S. Bulgakov.

(4) **The Church of Greece** suffered a great loss in the death, on Oct. 23, of its saintly and scholarly Primate, Archbishop Chrysostom of Athens. The Metropolitan Chrysanthos of Trebizond, a senior prelate of the Œcumenical Patriarchate but resident since 1921 in Greece, was elected on Dec. 10 to be his successor. The Zoë preaching movement has continued to spread.

(5) **The Serb Patriarchate** continued to feel the effects of its collision in 1937 with the Yugoslav State over an ill-conceived concordat with the Vatican. The Metropolitan Gavrilo Dozič, of Czernagora, was appointed to succeed the late Patriarch Varnava.

(6) **The Patriarchate of Rumania** felt the effects of the Central European crisis, following upon the absorption of Austria. The Patriarch Miron, as prime minister, has done much to stem anti-Semitism.

(7) **The Church of Poland** has been harassed by the government's sharp measures against Ukrainian nationalism. Over 160 Orthodox parishes in South Poland are said to have been dissolved, and their churches either destroyed or handed over to the Latin rite.

The situation in three of the Lesser Eastern, or Monophysite, Churches calls for some comment:

(1) **The Church of Ethiopia,** a daughter of the Coptic Church, remains in a state of chaos. The Italian government gives support to Bishop Auraham, declared Abuna after the refusal in 1937 of the Abuna Cyril to declare the Ethiopian Church independent of the Coptic Church.

(2) **The Church of Southern India,** a daughter of the Jacobite or Syrian-Orthodox Church, is threatened with a renewal of the lawsuits between the parties of the Patriarch and of the Catholics, which have been endemic since the Patriarch Abd-ul-Masih declared the Southern Indian Church autonomous and instituted the Catholicate in 1906. Nevertheless, a remarkable missionary effort, led by Mar Theodosios, is in process.

(3) The favoured treatment which the **Armenian Church** had received in the Armenian Soviet Republic appears to have been ended by order of Moscow. The death on April 12 of the Supreme Catholicos of Echmiadzin, Mgr. Khoren, was a disaster, both on account of his experience and influence, and because of the difficulty of electing his successor. (J. A. D)

EASTERN STATES are a scattered group of small principalities in India, under a Resident (Col. H. W. C. Robson); area about 67,000 sq. miles: pop. just over 8 millions. The best known of the group are Cooch Behar, Tripura, and Mayurbhanj.

ECUADOR, a South American republic situated astride the Equator on the Pacific, language, Spanish; capital Quito; president, Dr. Aurelio Mosquera Narváez. The area, including the Galápagos islands (2,400 sq. miles), is 337,392 sq. miles, but over 100,000 sq. miles is disputed with Peru. Pop. (1935 estimate) is 3,414,106. The chief cities are: Quito, 140,000; Guayaquil, 120,000; Cuenca, 42,000; Riobamba, 21,200.

Political instability marked Ecuador throughout 1938. On Aug. 10, a constituent assembly met and accepted the resignation of Provisional President Alberto Enríquez. His successor, Dr. Manuel María Borrero, resigned amid political turmoil on Dec. 1. The assembly then (Dec. 2) chose Dr. Aurelio Mosquera Narváez as constitutional president under a new constitution approved a few hours before. President Mosquera, however, was forthwith thrown into conflict with the assembly in a dispute centring about ex-President Luis Larrea Alba, and on Dec. 14 dissolved the assembly by force and called new elections for early in 1939. Part of the army, led by Larrea, thereupon attempted to overthrow the government, but the revolt was crushed after two days of fighting.

Behind the political unrest, and accentuated by the fact that no one political leader could command general support from the country, was popular dissatisfaction over the lack of progress in the acute boundary dispute with Peru. Negotiations with Peru had reached an impasse by June, and as frequent minor clashes in the disputed area continued, Ecuador appealed (Oct. 10) to the American republics who had just effected the Chaco settlement, asking for mediation. No positive results had been achieved by the end of 1938, however. Because of strained relations with Peru, Ecuador at first refused to attend the Pan-American Conference at Lima in December, but finally agreed to participate.

During 1938 the constituent assembly enacted several laws for the betterment of the Indian population and its protection from exploitation, and for co-operative farming. Nationalistic legislation directed against foreigners and rather idealistic laws for the protection of labour caused serious disputes with foreign corporations.

Economic improvement during 1938 was indicated by a record volume of railway traffic and generally increased trade. A barter treaty with Germany and a trade reciprocity agreement with the United States were made in April and August respectively.

Education. Ecuador has 2,239 elementary schools (enrolment over 180,000), 21 secondary schools, and four universities

Defence. Ecuador has an army of 10,000.

Finances. The monetary unit is the sucre (value: approximately fourpence). The 1938 budget was for 130 million sucres.

Trade and Communication. Ecuador has external communication by sea (almost entirely through Guayaquil) and north and south by air. Aviation facilities were materially improved in Nov 1938, when Quito became a regular "port of call" for the Grace Pan-American Airways. There are about 600 miles of railway and a growing highway system, with 420 miles of the Pan-American highway in operation and 245 miles under construction Imports (textiles, foodstuffs, and miscellaneous manufactured goods) in 1937 were $9,728,404, from the United States, Japan, Germany, and Great Britain, with exports of $12,122,950 (cacao, gold, oil, and coffee), almost half going to the United States. Cacao is the principal product. New mining laws enacted in 1938 have stimulated gold, silver, and oil production. In 1938 Ecuador produced 2,245,000 bbls. (est.), compared with 2,161,000 bbls. in 1937, and 1,617,000 bbls. in 1934. Ecuador is important in the production of "Panama" hats. (L. W. Be.)

EDDINGTON, SIR ARTHUR STANLEY, O.M., D.Sc., F.R.S. (1882–), British astronomer and philosopher. A biographical notice will be found in the *Ency. Brit*, vol. 7, p. 946. In 1928 he received the Gold Medal of the Royal Society, he was knighted in 1930, and in 1938 his reputation, internationally as well as nationally, was suitably recognized by the conferment of the Order of Merit. Sir Arthur's field has for the most part been in the realms of higher mathematical astronomy and physics, but while never deliberately writing for the lay reader, many of his works have a very wide public, among the more recent of which may be mentioned *Science and the Unseen World* (1929), *The Expanding Universe* (1933), and *New Pathways in Science* (1935).

EDINBURGH. Capital of, and second largest city in Scotland; pop. (1931) 438,998, (est. 1938) 469,700; area 32,402 acres; net rateable value (owner), £5,856,318.

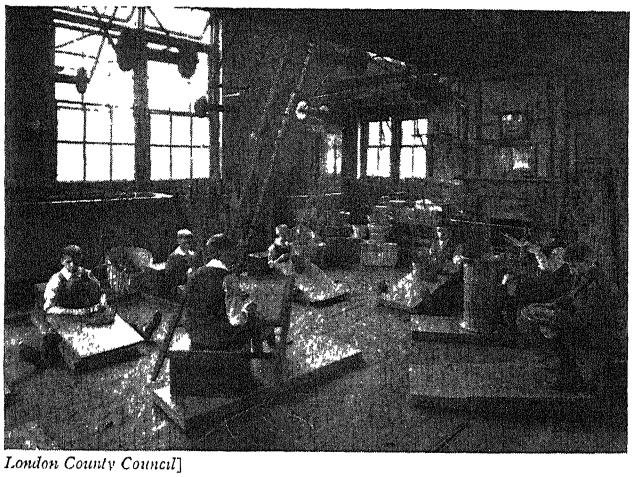
During 1938, the capital was visited by Queen Mary, who was in residence at the Palace of Holyroodhouse in September, by the Duchess of Kent in July, and by other members of the royal family. The freedom of the city was conferred on Mr. Walter Elliot and Lord Macmillan; and in June the Lord Mayor of London paid an official visit. The Empire Exhibition at Glasgow brought many visitors to the capital, numerous organizations taking advantage of the occasion to hold their annual conferences in the city, among them those of the Sanitary Inspectors and the International Union of Local Authorities.

The face of the city is undergoing considerable change, many public buildings being in course of construction, notably the new government offices, which are now nearing completion and should prove a worthy addition to the city's landmarks. Plans for a new public hall are at present the subject of open competition among British architects.

The extension of Leith Docks is proceeding favourably, and the contractors are now engaged in the construction of the breakwater. Among other large schemes of public utility, the Corporation is developing the foreshore between Granton and Cramond, and town-planning scheme for the hinterland is awaiting departmental approval.

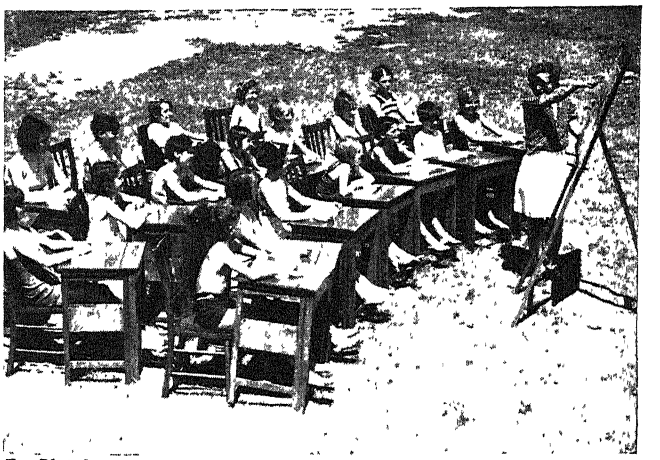
In common with other local authorities, Edinburgh has given much time and energy to the organization of an Air Raid Precautions scheme. The percentage of volunteers in the city is among the highest in the United Kingdom, over 9,000 having been enrolled by October out of a total of 13,000 required; the majority are now fully trained. A trial "black-out" was held over a large area of the Forth estuary in April, and afforded much valuable information to the authorities, as did the crisis period in September, when the organization was put to a severe test. The scheme has already been approved generally by the Home Office and is now being developed in detail.

EDSTROM, DAVID, sculptor, was born at Hvetlanda, Sweden, on March 27, 1873, and died at Los Angeles on Aug 13, 1938. He came to the United States with his immigrant family in 1880. He began work as a newsboy at 13, became a factory hand, and then at 21 decided to study art at all costs and worked his way back across the Atlantic to Sweden. He studied at the Swedish Royal Academy, and a rich patron started him on his successful career by sending him to Italy to continue his studies. He made portrait busts of many distinguished sitters, including members of the Swedish Royal family, and was responsible for the Montreal war memorial. Since he early developed what is called "the artistic temperament", however, he had many quarrels with his clients and smashed much of his sculpture. He gave a frank and convincing account of his life in his autobiography *The Testament of Caliban*, published in 1938.



EDUCATION. Under this head is included a general survey of education in the principal English-speaking countries of the world, to which is added a section on education in British India. For more complete details of education in Great Britain and Northern Ireland, *see* Elementary Education; Secondary Education; Education, Moral and Religious, etc.

British Empire. The collaboration of the members of the British Commonwealth in educational reform has become an established fact. The annual surveys published by responsible officers of all Dominions in the *Year-Book of Education* on some branch of educational system give useful comparisons, and thus help the members of the Commonwealth to develop a common British tradition. During the last two years Dr. F. H. Spencer, late Chief Inspector of the L.C.C., visited Canada, South Africa, and Australia, and presented reports on the reorganization of technical education. The reorganization of school systems on the lines of the Hadow Report goes on apace, the consolidation of rural schools is progressing, and the dovetailing of technical and academic post-primary education is a recognized aim of all Dominions.



Canada. The Dominion subsidy on technical education, granted in 1919 and renewed in 1931, was not paid during recent years, but in 1937 the federal government provided a sum of $1,000,000 for the National Employment Commission under the Department of Labour to be spent in 1937 for the purpose of training young people between the ages of eighteen and thirty for useful occupations.

In British Columbia the powers of the Ministry of Education were extended in 1937. Many one-school units were formed into administrative districts, with a Director of Education at the head. The revision of programmes was carried forward, and included secondary grades as well. The pamphlet, *Aims and Philosophy of Education in British Columbia*, pointed out the necessity of civic training and of adapting school-instruction to environment.

In Manitoba the New Education Act of 1937 gives enlarged powers to the Ministry of Education concerning

London County Council]

A CLASS AT HAZELBURY OPEN-AIR SCHOOL, EDMONTON NORTH, OPENED 1938. THERE IS A NINE-ACRE PLAYING FIELD

programmes, text-books, examinations, and qualifications of teachers

In New Brunswick the proposed reorganization of the school system is still in the committee stage. The committee set up in 1937, has agreed as to general plans and objectives. The 6–3–3 scheme was adopted, and a sub-committee was set up to draft programmes for the first six grades in detail. This part of the curriculum was to be tried out in practice by a selected group of teachers during the school-year 1938–39. The necessity for consolidation of rural schools is again emphasized by the Director of Educational Services in his Report.

County area is recommended as the new unit. Several surveys were made for that purpose.

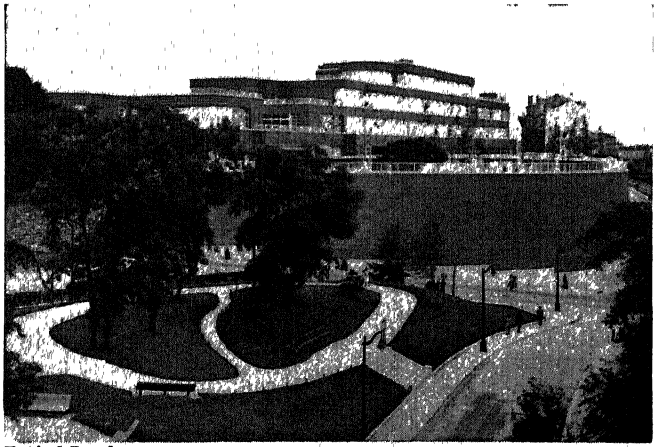
In Nova Scotia the Apprenticeship Act was passed in 1937, and the Director of Technical Education was appointed chairman of the new Apprenticeship Committee. There will probably be a rapid extension of vocational training, with a modern apprenticeship system in designated trades.

In Ontario new programmes for I–VI grades were published in 1937, followed in 1938 by new programmes for VII–VIII grades. Annual examinations from class to class are abolished. New programmes for secondary schools were also issued, in 1937 for grade IX and in 1938 for grade X. According to the recommendation of the Hadow Report, the first two years of secondary schools are made into a complete course in itself. Special subsidies are offered for the introduction of manual work and domestic economy.

In Quebec new programmes for the French-Catholic primary schools were approved in 1937 and introduced in the 1937–38 school year. Singing becomes obligatory, and more attention is paid to physical training and hygiene.

In Saskatchewan the secondary school curriculum was definitely divided into academic, preparatory to a university, and that of general culture, giving more scope to selective subjects of non-academic character.

Australia. During the last two years conferences of Ministers and Directors of Education urged the federal government to come to the aid of educational services in the six States, but up till now no departure from the old policy was made. In New South Wales the Act of 1936 established a consultative committee. A special committee on secondary education was entrusted with the revision of programmes. In 1936 a child guidance clinic was opened for the study of defective children. Technical education had special attention, since in 1936 consultative committees were organized in each branch of industry, including employees, employers, and teachers. In 1937, full-time day pre-apprenticeship classes for pupils with at least two years of post-primary education were established. In Victoria new transport schemes of post-primary pupils were instituted in nine additional districts. The new courses made great demands on the teaching staff, and in some cases the first wave of enthusiasm has almost expended itself. But in the best schools, where equipment is ample, school work has been given a greater measure of interest and reality. In technical education the enrolment reached a new record of more than 27,000 pupils, owing to the increased industrial activity and demand for technical instruction. A special survey of industrial conditions was carried out in the metropolitan area. In South Australia an agricultural bias was introduced in ten High Schools, and in 1938 two more High Schools were to have the course. The Superintendent of Technical Education was awarded a Carnegie grant for visiting the U.S.A., Canada, Great Britain, South Africa, France, and Germany. He brought back valuable reports on technical education in those countries. In Nov. 1937 an Australian Conference on Technical Education took place in Adelaide. The Conference discussed a wide range of subjects, including the raising of the school age and consolidation of rural schools. In Western Australia steady progress has been made in the consolidation of schools by means of bus services. During the year the Department experimented in introducing post-primary correspondence courses in remote rural schools. The Commonwealth Government granted a small subsidy for unemployed youth, which was spent on vocational training. In 1938 a Royal Commission on Youth Employment and Apprenticeship was set up. In Tasmania domestic science was introduced into all schools having more than 75 pupils. The provision of district rural schools, known as "area" schools, was extended.



New Zealand. In 1937, the proposed Council of Adult Education was set up and the grant for Adult Education increased. The Council of Educational Research issued in 1938 its report on the reform of the intermediate school system. The lowering of the age of admission to school to five years has become fully operative, and about 17,400 children under six years of age were in the schools during 1937. The number of students in Training Colleges has been increased in anticipation of the raising of the school-leaving age to fifteen years and the coming reduction in the

size of classes. The abolition of the Proficiency Examination (in 1936) will be evidently of far-reaching influence in the educational system of the Dominion. During 1938 the policy of consolidation was proceeded with, and approval was given to the consolidation of 103 small schools into 57 central schools. It becomes now more and more possible to bring to country pupils facilities which were previously the privilege of great urban centres. The work of vocational guidance, has been taken over by the government. Eight vocational guidance officers have been appointed in four chief cities. The scheme for the free issue of a half-pint daily ration of milk to children commenced on March 1, 1937. About 85 per cent of school children accepted the scheme, and, as the Report says, "There is much more mental activity than was anticipated and a renewed interest in the work".

The Union of South Africa. In 1937 a new Union Department of Social Welfare was created, which took over from the Education Department the administration of the new Children Act (1937). Some of the main provisions of the new Act are the raising of the maximum age of "child" from the sixteenth to the nineteenth birthday and of "infant" from seven to ten years, and the establishment of children's courts and commissioners of child welfare. On Feb. 19, 1937, the Union parliament passed the resolution: "That the government be requested to consider the advisability of taking steps to establish a National Education Board for the purpose of co-ordinating educational matters, such board in particular to devote its attention to the problem of the large number of children who leave school without having progressed beyond the primary stage". Two memoranda were prepared by the Education Department, recommending reform of the whole system of finance. The present system of Union subsidies creates a glaring inequality of opportunity for post-primary education as between the provinces, and especially as between the rural and urban communities. The suggested remedy is to distribute grants according to the needs of the respective areas and their ability to maintain the schools. In Natal the Education Commission issued in 1937 its Report, in which it recommends *inter alia*: (1) the raising of the school-age to sixteen years and free education up to sixteen years; (2) registration of all private schools; (3) reorganization of the system on the lines of the Hadow Report, with a break at twelve years; (4) an agreed syllabus in religion with safeguards for objectors; and (5) consolidation of rural schools. In the Orange Free State the system of consolidating rural schools by using motor transport is developing, and at present about 3,000 pupils are thus transported to 35 central schools. In the Cape of Good Hope new provision has been made for remotely domiciled pupils. The new primary course was published in 1937 and introduced in some schools in 1938. From 1939 it will be in operation in all schools. Its three fundamental principles are: (1) the school should be child-centred; (2) the school should train the child so that he will adapt himself quickly and function easily in the society in which he will have to live; (3) the teacher must be granted as large a measure of freedom and responsibility as possible. In the Transvaal the consolidation of rural schools is proceeding through the use of motor transport and the establishment of boarding-houses in central schools. A special commissioner of vocational guidance was appointed. A special Commission of Education, similar to that in Natal, was set up in 1937 to report on the whole school system.

SCHOOL AT PUTEAUX, NEAR PARIS, OPENED JUNE 9, 1938

Eire. The introduction of Irish in secondary schools is being gradually extended, so that at present 25 per cent of secondary schools do all their teaching work through Irish and about 35 per cent more are bilingual. The system of vocational and technical schools started in 1930 is rapidly expanding. At present every Irish town of 4,000 to 7,000 people has municipal vocational schools and the county committees are establishing similar schools in larger villages. The local authorities, in co-operation with the Ministry of Education, are preparing plans for selecting and training teachers in the following six branches: (1) rural science, (2) woodwork, (3) metal work, (4) engineering and mathematics, (5) commerce, and (6) Irish and cultural subjects. The teachers of vocational schools have to pass an examination in the command and use of oral Irish before appointment. Twenty new regional schools for local needs were opened in 1936–37. The curriculum is closely connected with the local industry. Besides engineering, rural science, spinnning, and dyeing, special centres for advanced training in various branches of technology were established in 1936–37.

1938 OPEN-AIR SCHOOL AT UCCLE CALEVOET, BELGIUM

British India. In view of the reorganization of Indian administration now in process, education is temporarily in the background. Existing ministries are reluctant to frame extensive schemes, which they may not be in a position to carry out. But the discontent with existing educational provisions is widespread, and there is unanimous demand for reform. In the coming reorganization a valuable service might be performed by the Central Advisory Board of Education which, after being abolished in 1923, was revived by the Government of India in 1935. The defects of the present system are generally recognized. They are: (*a*) an appalling stagnation and wastage, especially in primary stages; (*b*) inefficient local administration; (*c*) overcrowding of colleges and universities by students unfitted for higher academic studies; and (*d*) ludicrously inadequate provision for the education of girls. However, there are some encouraging signs. There was a considerable increase in the two upper classes of primary schools during the last two years, thus showing a diminution of wastage. The percentage of trained teachers is also continuously increasing. The number of girls under instruction is rising more rapidly than that of boys. The enrolment of pupils of depressed classes is increasing both absolutely and relatively. The prejudice against them is slowly dying out, and they are now generally admitted freely into ordinary schools and are allowed to sit in the class along with other children.

United States. On Feb. 18, 1938, the committee which President Roosevelt in June of the previous year had requested to study the entire question of Federal aid to education, made to him its report, which is one of the significant contributions to the discussion of a very important and for many decades a very vexed educational question. Decision on the recommendations of the committee, of course, rests with the Congress.

The committee was unanimous in its judgment that, because of the wide disparities of wealth, income, and educational burden among the 48 States and also among counties within almost every State, Federal aid to education was necessary if not, in fact, inevitable. The report showed that in some States there were twice as many adult workers (on whom the burden of educational support falls) per child of school age as in some other States. It also showed that an undue educational burden continued to fall on the rural areas. This burden appeared to be very heavy in the southern States Forty per cent of the people of the United States between the ages of ten and twenty in 1920 had gone to urban communities by 1930. This fact had far-reaching educational significance.

The committee recommended Federal aid to education on the basis of educational *need* of the several States and proposed a procedure by which such need could be determined fairly objectively and accurately. In addition to aid for general education it also recommended special funds for teacher education, school buildings, State departments of education, adult education, rural libraries, and educational research through the United States Office of Education. The fiscal recommendation of the Committee was for $72 millions in the year 1939–40 and annual increases of Federal grants until these reached $202 millions by the year 1944–45.

One recommendation of the committee was that the Civilian Conservation Corps and the National Youth Administration be merged into a National Youth Service Administration. Another recommendation, which created considerable discussion and caused some apprehension, was that which would permit pupils in non-public schools to share to a limited extent in the proposed Federal educational aid. Benefits in such schools, under this recommendation, would derive from textbooks and other reading materials, transport, scholarships for pupils sixteen to nineteen years of age, and certain health and welfare services. The conditions under which such benefits would be enjoyed by pupils in non-public schools "should be determined by the States, or by the local school jurisdictions receiving the grants if the States so determine". This part of the report, and the old fear of Federal control of education in the States if Federal aid should be provided, aroused wide discussion. In this connexion it should be noted that the Constitution of the United States does not mention education; and by implication in the tenth amendment to that document the promotion of education has been considered a local or State responsibility.

The American Federation of Teachers, which is affiliated to the American Federation of Labor, held its twenty-second annual meeting in August and reported that its membership had doubled in two years. The organization now has in 250 localities about 30,000 members, or three per cent of the million teachers in the United States. Jerome Davis, formerly of the faculty of Yale university, was elected for a third term as president of the Federation.

The second national conference on educational broadcasting was held in Chicago in the late autumn of 1937, under the sponsorship of 28 national organizations, with 87 other national organizations co-operating. Five hundred people from thirty states and Canada attended the conference, the purpose of which was to consider such matters of public policy in radio as: provision of a national forum for discussion of education by radio; examination and appraisal of conditions in broadcasting as a basis for consideration of the resources of wireless education; and the means of bringing to as large an audience as possible the findings of studies made in educational broadcasting.

The work of the American Council on Education was varied. One of the most important projects now going forward in the Council is a comprehensive study of teacher education in the United States. This study, which has been made possible through a substantial grant from the General Education Board, was begun in Jan. 1938, and is to continue for five years. A commission has been set

up by the Council, with Payson Smith, formerly commissioner of Education in Massachusetts, as chairman, and Karl W Bigelow, formerly of Columbia university, as director. There is widespread interest in the study because the improvement of teaching is so closely related to practically all reforms in the entire field of education During the year the Council, in co-operation with many national organizations, held a conference in which problems of teacher education were discussed. A similar conference is to be held in 1939

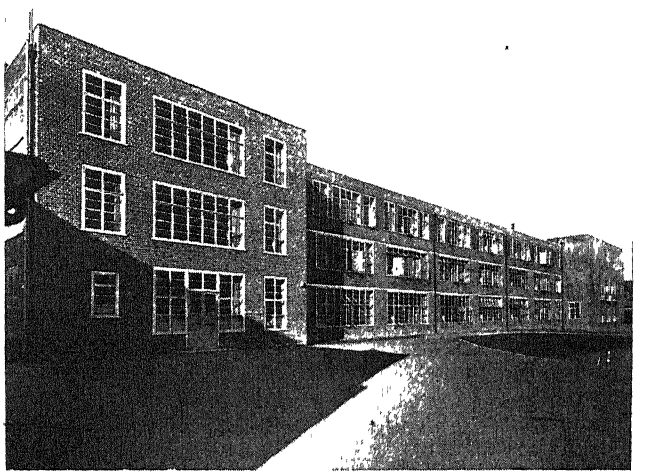
During the year there was considerable discussion of the annual report of President James B Conant, of Harvard university, in which he expressed the opinion that a reduction of the number of students in higher educational institutions in the United States was desirable This theme he developed in an address in February before the annual meeting of the American Association of School Administrators and also in *Harper's Monthly Magazine* for May. His opinion was questioned rather pointedly even if by implication by President Robert M. Hutchins, of the University of Chicago, in *The New York Times Magazine* for June 12. It was interesting to note that each of these eminent higher educational leaders invoked, in support of his peculiar argument, the educational views of Thomas Jefferson, expressed nearly 100 years ago. Jefferson was the first American statesman to consider education a fundamental part of the democratic faith; and his perspective for education has not yet been gained by any American commonwealth or any American college or university president.

For the second year students from the thirty schools, distributed throughout the country, that have been participating for several years in the experiment of the Progressive Education Association and who entered college without taking the entrance examinations, were reported to have done better in their studies than a similar number of students who entered college under the old plan. This information came out at the second Progressive Education Association's Workshop, held at Sarah Lawrence college, Bronxville, New York, in the summer. Similar workshops or conferences of the association were held in Colorado and California. The Southern Association of Colleges and Secondary Schools conducted such a conference for several weeks at Vanderbilt university, Nashville, Tennessee, but not in affiliation with the Progressive Education Association. About 1,100 students from the schools in the experiment of the Progressive Education Association entered 170 different institutions in 1936 and about 1,200 the following year. A larger group entered college in the autumn of 1938. The outcome of this interesting and widely publicized project is awaited eagerly by the professional educators and perhaps, also, the public generally.

Wide discussion of "progressive" education continued during the year. In his *Experience and Education*, John Dewey gave a clear analysis of traditional education and of so-called progressive education. This book and Boyd H. Bode's *Progressive Education at the Crossroads* were interpreted by some critics of progressive education as warnings both to the ultra-progressives and the ultra-conservatives in educational philosophy. Dewey said that "those who are looking ahead to a new movement in education, adapted to the existing need for a new social order, should think in terms of education itself rather than in terms of some 'ism' about education, even such an 'ism' as 'progressivism'."

Very important was the publication, in *The Student and His Knowledge*, by the Carnegie Foundation for the Advancement of Teaching, of the results of its long study of the relations of secondary and higher education in Pennsylvania, through high school and college examinations given in 1928, 1930, and 1932 The book shows the academic inventory and the academic growth of the baccalaureate mind It also shows that the student is more important than the curriculum, and that the American system of units and credits has served its day and may soon cease to be

Other important developments during the year included increased appropriations for public educational support in most of the States; the full or partial restoration of salaries of teachers to the pre-depression level, continued interest and activity in the field of curriculum study and curriculum construction and reconstruction, about which much ado has been made for many years; the tendency for teachers' colleges to offer work for the master's degree; and the tendency towards a wider discussion and consideration of the problems of instruction and of general education, especially in high schools and colleges. Here and there also appeared tendencies to alter conventional requirements for advanced degrees, in such fields as education, sociology, public welfare, and public administration, and other younger disciplines in higher education. It should be noted that through the aid of the Public Works Administration of the Federal Government several hundred million dollars were expended in the erection of school, college, and university buildings throughout the country. Increased interest appeared in educational experimentation, in addition to that now being promoted by the Progressive Education Association, the Southern Association of Colleges and Secondary Schools, and other organizations.



On Dec. 12, 1938, the Supreme Court of the United States reversed a decision of the Supreme Court of Missouri on writ of certiorari and held that Lloyd Gains, petitioner, a Negro citizen of Missouri, must be admitted to the Law School of the University of Missouri, unless facilities equal to those provided in that institution were made available to him elsewhere within the State. This was one of the most significant decisions affecting education made in the United States in many years. It seemed to mean that those States (seventeen in number) that have been maintaining the public policy of separating the two races in educational institutions must make radical alterations in their arrangements for graduate and professional work for Negroes. The decision was immediately seen as a momentous one, with many puzzling ramifications. The majority opinion was delivered by Chief Justice Hughes. The separate opinion was delivered by Justice McReynolds and concurred in by Justice Butler. The number of Negroes in any one of the States affected by the decision, who will desire graduate or professional training, is likely to be small for many years to come. This fact will make the maintenance of equal higher educational facilities in separate institutions impose in some instances heavy financial burdens. Prominent leaders of both races have considered and discussed the possibility of providing a regional university for Negroes to be supported by funds from the various Southern States. Apparently, however, the recent decision makes such a plan impossible, as does also the practice of subsidizing Negroes in universities outside the South. (*See* also ADULT EDUCATION; EDUCATION, NEW METHODS IN; ELEMENTARY EDUCATION; SECONDARY EDUCATION; VOCATIONAL EDUCATION; UNIVERSITIES AND COLLEGES.)

EDUCATION: ADMINISTRATION AND FINANCE.

The Education Act, 1936, has provided the major administrative problem of the year 1938. Local authorities, in preparation for its operation, have been considering how and upon what terms they will issue, on and after Sept. 1, 1939, leaving certificates for "beneficial employment", and they have been dealing also with numerous applications received under the later clauses of the Act for grants towards the cost of erecting non-provided senior schools and purchasing the necessary sites. In the first task they have been assisted by a joint memorandum issued by the three principal Associations of Local Authorities, which gave a lead as to the attitude to be adopted to the various considerations which have to be weighed in assessing "beneficial employment." The procedure for dealing with grants to non-provided senior schools was outlined by the Board of Education in a circular which admirably anticipated the administrative difficulties which confront local authorities and the voluntary bodies when considering proposals and determining the conditions to be attached to building grants. The absence of friction between local authorities and the churches over these complicated transactions, except in Liverpool and one or two other areas, has shown that the controversial attitude of other years has been largely replaced by a spirit of goodwill. The building grants agreed upon by local authorities have ranged between the two prescribed limits, namely 50 and 75 per cent, and there has been some variety also in the conditions upon which the grants have been made, especially as to the method of appointing teachers. Meanwhile, local authorities have been pressing forward with their schemes of reorganization with a view to a complete system of senior schools, but in some cases progress has been delayed by such factors as the uncertainties arising from new housing and slum clearance. Considerations of this nature and the special difficulties encountered in certain rural areas led the Board of Education to extend in approved cases the period of the fifty per cent building grant to local authorities for a further period of three years, that is up to Dec. 1943. The demand of the Ministry of Health for a five-year programme of capital expenditure involved education committees, in common with other branches of the local government service, in the task of surveying future capital requirements; the subsequent statements by the Board of Education indicated that, while that department viewed the replacement of obsolete elementary school premises as an urgent problem, it was less ready to approve capital expenditure upon secondary schools. Much consideration was given by education authorities during the year, in consultation with teachers, to the subject of Air Raid Precautions, and tentative plans for an emergency were prepared in most areas based, as a rule, upon a somewhat cautious circular issued by the Board of Education in Jan. 1938. The crisis—and the enterprise of the London County Council in particular—enabled the general public to appreciate how valuable a part local education authorities and teachers can play if, in the event of an emergency, the rapid evacuation of congested areas should be necessary.

Among more normal activities may be mentioned the inquiries into nursing services by an inter-departmental committee, into the teaching of domestic subjects under the auspices of the Board of Education, into juvenile delinquency by the Home Office, the completion by the Board of Education's consultative committee of their protracted investigation into problems of post-primary education, and the issue of a departmental report on the problems of

London County Council]
LONDON JUNIOR ELEMENTARY SCHOOL, OPENED 1938

children with defective hearing. Other points of interest were changes in the conditions of the School Certificate, including a revision of its principal examination dates to assist the movement for "staggered holidays"; the continuance of the National Fitness Campaign and the appointment of a number of area organizers; the tendency of local authorities to increase their grants to universities, and the notable rally of educationists and industrialists in the north-east to the support of the now federated University of Durham; the increasing stress upon the value of education at the nursery stage; and the further growth of technical education and the opening or extension of a number of technical schools and colleges.

Local education authorities have, during the year, again pressed for a review of the grant system, and their demands evoked the sympathetic attention of the Board of Education. But the problem still awaits thorough investigation. The existing terms of the financial partnership between the Board and local authorities are unsatisfactory, based, as they are, on the Report of the Kempe Committee issued in 1914, when the demands upon local expenditure were much less exacting. In 1913 the cost of education was under £30 millions; in 1923 it had risen to £70 millions, and the charge on local rates had advanced from 18·9*d.* in the pound to 34·8*d.*, an increase of nearly 100 per cent. The latest figures available are for the year 1936. The expenditure for that year shows a further increase to £88 millions and the charge on local rates advances to 38·7*d.* in the pound. The problem mainly concerns the finance of elementary education For higher education the government pay fifty per cent of the recognized expenditure; but for elementary education the grant is still calculated by the obsolete Kempe formula, based upon figures which showed the cost of elementary education to be £3 per child; in 1936–37, however, the average cost per child exceeded £15. In 1918, the Fisher Act ensured that local authorities who received less than fifty per cent under the formula would have their grant made up to that proportion; this concession was suddenly repealed during the financial crisis of 1931, and has never been restored. While the proportion of the Exchequer's contribution to local educational expenditure has, in the post-war period, decreased by more than ten per cent, scarcely less serious is the formula's prescription of a differential rate for different services. The hampering effect of this

may be illustrated by the position which has arisen during the year concerning the provision of clothing and footwear for physical training in elementary schools. The government have rightly urged local authorities to make this provision, but, in spite of protests, the Board of Education, at a time when generous capital grants up to 75 per cent are being made under the Physical Training and Recreation Act to clubs and similar organizations, have found themselves unable to contribute for this purpose more than the twenty per cent which the formula allows for "other expenditure". A grant system so obsolete and inequitable can hardly survive much longer. (W. O. L. S.)

EDUCATION: GENERAL TRENDS. The movements characterizing the general trends of education in 1937 received a new, deeper, and even a tragic significance in 1938 from the political world-situation leading up to the September crisis. The intensification of nationalism in the totalitarian states has bent the bow of education in school and university even more tautly in the direction of subservience to the state and the despiritualization of educational values. The disruption of national life in China has brought about the destruction or dispersal of the majority of Chinese universities, and there appears to be a deliberate attempt in Japan to eliminate democratic influences in education. Even in the democratic countries there has been manifest a sharper note of criticism of education as too academic and of the examination system as too tyrannical and in need of overhaul and relaxation. Suggestions for rationing the numbers of students in universities have been made, more particularly in England, Germany, and America: it is maintained that large numbers of undergraduates are either unsuitable for university education or that the universities themselves are out of touch with modern needs. In England these tendencies have been associated with an increased interest in religious, moral, and civic education. In Italy many Papal allocutions have emphasized the seemingly irresolvable conflict between the secular and religious educational ideologies. The youth labour camp movement, noted in the *Ency. Brit. Book of the Year*, 1938, as peculiar to Germany, received unexpected support from the September crisis in the problem, raised for all great nations, of the evacuation of school children from vulnerable centres of population. Both in Berlin and London this problem received prompt attention from the educational authorities, and the measures taken by the London County Council and the services rendered by the teachers, men and women, were a notable illustration of the ever-increasing sense of civic service and vocation in education. This evacuation problem also served to direct attention again to the question of school buildings: are they being erected on too lavish and permanent a basis: is there not a stronger case for the portable school buildings and for the school as a community centre?

Common to most countries, and deriving not a little of its force from world rearmament is the growing volume of constructive criticism of school curricula. It is apparent in the report of a three years' inquiry into the character and cost of public education in New York State: there it is found that the primary public school curriculum needs revision and reintegration; curricula in high schools and colleges are too narrow and lack co-ordination; universities are less centres of research and learning than of mass production of uneducated graduates. It is apparent in France, where, by means of a series of *arrêtés*, variations in the curricula of *lycées* and *collèges* have been introduced and the co-operation of both parents and pupils enlisted. M. Monzie

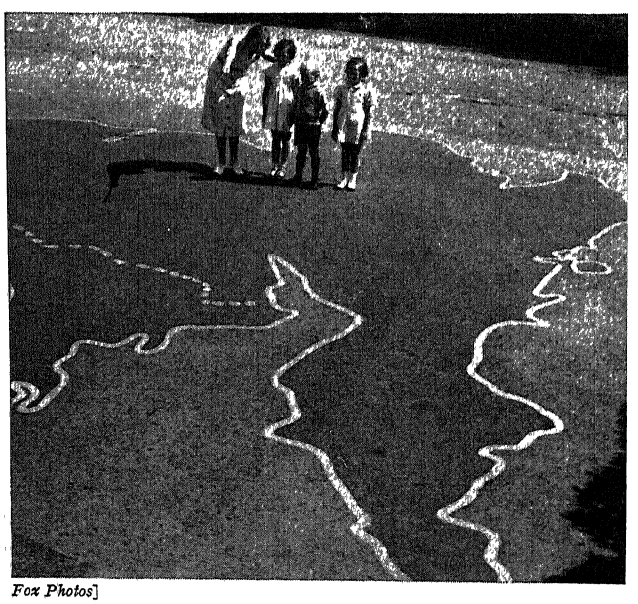
London County Council]
ART CLASS IN A JUNIOR ELEMENTARY SCHOOL, LONDON

has emphasized three factors in the problem—co choice, and rationalization. The last has led to what a called classes *d'orientation*. The curriculum problem is al apparent in the field of the training of teachers, and England a committee of inspectors of the Board of Educ tion has produced a far-reaching and severely criticiz memorandum thereon, while the National Union Teachers has produced a voluminous report of an investiga ing committee insisting upon the necessity for a clos contact between training colleges and universities (s TEACHERS, CERTIFICATION OF) and for greater unity in tl teaching profession as a whole. But transcending in in portance all these manifestations of criticism of curricula the recently issued volume by the Consultative Committe of the English Board of Education. This report, briefl known as the Spens report, deals with secondary educatio and is the climax to the long series of reports from thi Committee which began in 1926. The education of youtl has been a main preoccupation of the Committee for ter years past and the Spens report gives articulate expressio to several long-felt but rarely voiced convictions and criti cisms. As such, the Spens report gives a lead to the worl in the field of education. Is secondary education as the world has known it for the first thirty-five years of this century doomed? Must it at last be freed from its deep roots in the mediæval grammar school, must not the requirements of a realistic youth psychology and of a realistic *weltpolitik* be met in the creation of a new system of technical education? What Germany, Switzerland, and to a less extent France had done on a small scale at the close of the nineteenth century, Russia and the English-speaking countries are attempting on a vaster scale. The scholar, not the subject, is the primary concern of the Spens report, but the scholar as a future citizen dedicated to the service of the state. Hence the recommendations of the report are based upon a deep concern for the physical and psychological interests of youth. Because of this concern, the report stresses the value of the corporate life of the school, particu-

larly expressed in the school-dinner; the importance of reasonable self-government, of a tutorial system in schools, and of the appointment of careers masters. Following upon these universally applicable ideals, the report recommends the complete reconstruction of the curriculum of the orthodox secondary (grammar) schools, with a greater emphasis upon physical education, æsthetic subjects, and the Bible (*see* EDUCATION, MORAL AND RELIGIOUS). It gives a new orientation to environment for the country grammar schools, and above all it recommends the immediate creation of a new type of school, the Technical High School, to enjoy the same prestige and public support as the older type of secondary schools This is probably the most important constructive recommendation since the establishment of junior and senior schools as the result of the 1926 Hadow Report on the Education of the Adolescent, and it provides for the administrator the problem of co-ordinating the three streams of post-primary education—that of the senior school (with the additional year now in force), that of the secondary or grammar school, and that of the new Technical High School. At long last English education is beginning to conform to the continental, particularly the German model.

During 1938 the attention of educators continued to be drawn to the effects of the falling birth-rate, and a private inquiry was instituted by a conference of Head Masters of public schools: it is indeed debated whether within the next decade many of the public schools founded in the nineteenth century will either be eliminated or driven to seek state support and enter thereby the category of aided secondary schools. At the same time the economic pressure upon pupils in the English public schools has led them to seek careers in industry and commerce both at home and abroad, and this has been largely responsible for the noticeable extension of travel-tours for public school as well as for secondary school pupils. These tours cover the Empire as well as the Continent: the National Council of Education, the Overseas Education League, and the Hudson's Bay Company have been conspicuous in this activity. Parallel therewith have been the extended scholarships and bursaries for overseas students of all nationalities provided by the British Council and in some cases by the Colonial Office.

Such tendencies are indeed but another aspect of the problem of education for leisure which modern conditions make so acute. It has been the commonest theme for Speech days, and the encouragement of School Libraries, the development of hobbies, the strengthening of camp, club, and hostel movements for youth are all indicative of a constructive concern for equipping youth with a variety of interests enabling them to live wisely, to think critically, and to feel finely upon great issues. So, too, the increasing stress upon civic education and the pronouncements of such authorities as Professor I. L. Kandel, Dr. F. C. Happold, Lady Simon, of Manchester, and others signify that the nobler aspects of education for citizenship have a wider appeal than perhaps extremists in political camps suppose. Aligned with this has been the increased interest in textbooks: their scope, character, function, and use. The Board of Education's Reports on School Libraries, on Technical High Schools, and upon examinations make clear that not only must the quality of text-books be ever subject to improvement, but also their proper purpose and the right technique in using them. If "set" books are to disappear from school certificate examinations, texts and text-books assume a new importance.



An important indirect influence upon the general trend of education was exercised by the publication of the Home Office report upon corporal punishment in prisons. For many years past the permanent efficacy of, and ultimate justification for the physical chastisement of children have been doubted: now the Home Office report gives new support for a humane system of school government and discipline so that education may indeed be, in Charlotte Mason's words, "an atmosphere, a discipline, and a life" (*see* EDUCATIONAL ASSOCIATIONS). A noticeable experiment in that direction may be seen in the establishment, under Home Office auspices and the governorship of Mr. Cyril A. Joyce, of a new type of Borstal Institution in the Hollesey Bay Colony, East Suffolk. There education is realized as recuperative and remedial, liberal as well as vocational. (A. A. C.)

EDUCATION: MORAL AND RELIGIOUS. The year 1938 was characterized by exceptionally widespread and sustained interest and activity in moral and religious education. In the legislative field, the Protection of Young Persons Act was speedily followed by the acceptance of Miss Florence Horsbrugh's measure for the amendment of the Adoption of Children Act of 1926. Both these measures, together with the Home Office Report on the abolition of corporal punishment in prisons, are justly to be regarded as chapters in the moral and religious education of a people. A similar and equally strong expression of the feeling for moral education was found in the generous attitude everywhere adopted towards refugees, especially children, from Germany, Spain, Czechoslovakia, and elsewhere. Both Lord Baldwin's fund and the Church Assembly's vote of £50,000 were further indications of an awakened national conscience. Two historical commemorations gave to moral and religious education in 1938 the deeper significance and value derived only from history and tradition: (i) the celebration of the 400th anniversary of Henry VIII's Injunction ordering an English Bible to be placed in every parish church: these celebrations included, not only religious services, but largely attended lectures all over the country, and B.B.C. discourses; (ii) the celebration in May of the bicentenary of John Wesley's conversion: this celebration, in which the Anglican as well as the Methodist church participated, was a striking example of the growth of religious tolerance and co-operation.

The September crisis provided a further illustration in the extraordinary spread of services of public and private intercession, while a negative test of the strength of the cause of moral and religious education was found in the fiasco of the so-called "godless" congress held in London. Great interest was taken in the publication of a Report on religious education of which the Master of Balliol was a principal signatory: the report bore witness to the essential and central place occupied in education by religion which, while unteachable as a life, is nevertheless in its institutional and above all in its scriptural elements both fundamental and teachable. Still more striking is the fact that a whole chapter of the Consultative Committee's Report (*see* EDUCATION: GENERAL TRENDS) is devoted to Scripture. The Spens Report emphasizes the need for skilled and expert teaching of Scripture, requires an objective and historical approach thereto, and a proper subordination of the moral teaching of the New Testament to its religious affirmations. The Report also ranks religious knowledge (Scripture) equally with the mother tongue in the education of the adolescent. It is not surprising therefore that conspicuous success has attended the formation of the Institute for Christian Education, which has organized active

branches throughout the country. Nor has the cause of civic and moral education thereby suffered or been weakened Once again, the Spens Report has given a much-needed and valuable stimulus in insisting that, if proper use is made of the " utility " phase in the development of the interests of youth, the moral and civic education of both sexes can be at once informal, real, and of lasting value There is thus official recognition, both of the central importance of moral and religious education, and of a fundamental principle of technique, that method therein should be the way of discussion rather than of dogma : " It is a cardinal principle that the examination in these matters should follow the curriculum and not determine it ". (A. A C.)

EDUCATION, NEW METHODS IN. The new or progressive education has developed along two lines, one deriving its inspiration from a new philosophy, the other from a new scientific outlook. The philosophy on which the new education is admittedly based is Dewey's experimentalism or instrumentalism, itself a development of James's pragmatism. The negative aspect of Dewey's teaching is a denial of permanent values or ultimate aims in human experience; *The Quest for Certainty* on which mankind has been engaged since the time of Socrates is regarded as a mere will-o'-the-wisp. This tends to the rejection by the progressive schools of all human achievement and culture, as well as of the well-established principles of science. The content which largely constituted the curriculum of the old education is dismissed as mere formalized subject-matter, a residue of mediævalism. Emphasis is transferred from the timeless to the changeable, as in *Education for a Changing Civilisation*. Dewey's positive doctrine affirms that everything in life is provisional, instrumental, a means to an end that emerges only as we proceed. Reality, it is also contended, is revealed in action, not by thought. The method by which alone progress is possible is, for Dewey, the experimental; deductive thinking which has proved fruitful in every branch of knowledge is considered appropriate only to a static civilization. The obvious, although not the significant, feature of the experimental method is overt action ; hence the new education's slogans—" activity for activity's sake ", " activity leading to further activity ". The only activity

Fox Photos]
GEOGRAPHY TAUGHT BY A MAP DRAWN ON THE PLAYGROUND AT A CLAPHAM COMMON SCHOOL, LONDON

nevertheless that is educative is a significant activity which, while enabling the pupils to satisfy their present needs, by the same act reveals, interprets, or augments reality, thus the creative fantasy of the child must be disciplined into logical thought, universal in its nature, if the child himself is to gain real satisfaction and if his activity is ultimately to contribute to the solution of the world's problems. So with morality and art, although not all progressive educationists recognize the need of objective validity in the pupil's efforts Dewey's philosophy of education, with its emphasis on the industrial arts, has undoubtedly value, if only for its recognition that " civilization is for good or ill finally established upon the basis of machine-production and culture must make terms with this fact or perish " ; an enrichment and extension of the curriculum has resulted, the aim being to approximate the conditions of school to life outside. This tendency has been reinforced by the researches of the scientific movement applying its principle of " frequency of use " to answer Spencer's question, " What knowledge is of most worth ? " Educational method is relative to the content of instruction ; as the applied sciences constitute the predominant feature of the curriculum, the technique of the workshop becomes the method of the school. Hence the place of " the project " in the new education. The free activity of the pupil, failing to find expression in collective class methods, demands individualization of instruction, which may take the form of the Montessori method for young children or the Dalton plan for older pupils, the latter differing from the project mainly in the fact that it admits a predetermined curriculum. In all the new methods teaching is displaced by learning, and the motto of the new schools becomes, in the words of Caldwell Cook, " Here we learn ", not " Here they teach ". The scientific movement has likewise contributed to the individualizing of instruction by revealing through its application of mental tests the great variations of intelligence among children. In the sphere of school discipline the democratic implications of the new education are most apparent. The old discipline was autocratic ; the aim of the new discipline is to make the pupil self-reliant, to train him to become a self-respecting citizen in a democratic community. To this end freedom is indispensable, but it must be a freedom compatible with discipline : hence the new education's support of self-government by the pupils. Failure to substitute a new, but more effective, discipline for the old has brought upon some progressive schools Dewey's censure : " It is the absence of intellectual control through significant subject-matter which stimulates the deplorable egotism, cockiness, impertinence, and disregard for the rights of others, apparently considered by some persons to be the inevitable accompaniment if not the essence of freedom." The new curriculum, new equipment, new methods, which progressive education demands, account for the present enthusiasm for school planning by education authorities. Progressive education is at present eclectic ; the task of the future will be to effect the synthesis between the new educational philosophy and the new scientific movement in education.

EDUCATIONAL ASSOCIATIONS. In Great Britain educational associations, both of public and professional character and interest, are so numerous and diverse that they cannot be cited seriatim in such a book as this. In

1938 the professional associations, particularly the National Union of Teachers, were vigilant and vocal on the problems arising from the raising of the school-leaving age; the evacuation of pupils in times of war, and the Spens report. Specialist associations such as the Institute of Christian Education and the Association for Education in Citizenship were increasingly supported by the growing lay public interested in education. All these associations participate either in the week of educational conference held in London each January, or (so great is the number) in the not less influential North of England Conference held at different northern cities also in January. As a rule these composite conferences have private sessions as well as inaugural meetings. In Jan. 1939 the three principal inaugural addresses were given by Sir Charles Grant Robertson, Sir Richard Livingstone, and the Dean of St. Paul's. The place of religion and theology in modern universities was the theme of the first; a critique of the university product occupied the second, while Dr. W. R. Matthews raised the issue of what civic education really means.

The most active non-specialist association was the Parents' National Education Union, which celebrated its jubilee. A considered appreciation of the work of its founder Miss Charlotte Mason was delivered by Professor A. A. Cock, who raised in the same address the whole question of the physical chastisement of children. (A. A. C.)

EGYPT. The year 1938 opened with a new cabinet in office, representing all parties except the Wafd, under Mohamed Mahmud Pasha. Almost immediately came the defection from the Wafd of the more enlightened element, known as "Saadists", led by Dr. Ahmed Maher and Mahmud Fahmy El Nokrashi Pasha.

On Jan. 20 King Farouk was married to Mlle Farida Zulfikar amid widespread popular rejoicings. Five days later the young King established a precedent by broadcasting his thanks to the nation for their demonstration of affection and loyalty.

On Feb. 2 the chamber was dissolved. Elections on April 1 resulted in an overwhelming victory for the government, with whom the Saadists had joined hands. At the opening of parliament on April 12 another break with tradition occurred, when Queen Farida, accompanied by the Queen-Mother, sat, lightly veiled, in an open box.

On April 24 a cabinet crisis occurred owing to Ismail

KING FAROUK AND QUEEN FARIDA OF EGYPT

Sidky Pasha's objection to relinquishing the Finance for the War portfolio, which the King wished him to take in order to speed up the reorganization of the Army; on May 13 Sidky resigned on his appointment as a director of the Suez Canal Company. But the reconstruction of the cabinet was delayed until June 24, when the Saadist leaders took the place of the Ittahidist and Shaabist representatives.

On May 26 King Farouk's eldest sister, Princess Fawzia, became engaged to Shahpur Mohamed Riza, Crown Prince of Iran.

On June 2 the dispatch of a government mission to select a site for a dam near the point where the White Nile leaves Lake Albert was announced.

Meanwhile, considerable criticism was aroused by the news that the barrack accommodation, which Egypt had undertaken to provide for the British troops on the Suez Canal, would cost the country £E 15 millions. There was also much talk about the British military mission having exceeded its powers. On July 5 Hassan Sabry Pasha, War Minister, publicly paid a handsome tribute to the work of the mission, and on Aug. 4 the Egyptian premier initialled in London an agreement, signed in Alexandria on Sept. 22, whereby the British government undertook to bear half the cost of the barrack accommodation. On Aug. 31 Brigadier-General G. M. Macready was appointed chief of the British military mission in succession to Major-General Sir Marshall Cornwall.

The menace of war in Europe found Egypt unprepared, and the Governor of Cairo, Abdel Salam Shazly Pasha, was placed in control of A.R.P. measures, the services of Capt. Burt-Smith, a Home Office expert, being secured to advise him.

On Oct. 11 an Arab Congress for the defence of Palestine declared the Balfour Declaration null and void, rejected partition, and demanded the cessation of Jewish immigra-

tion and a national constitutional government for Palestine. An Arab Women's Congress, a week later, voted similar resolutions.

On Nov. 3 the delegation sent by Lancashire under Sir Thomas Barlow to discuss the question of the high import duties on cotton-piece goods reached an agreement with the Egyptian government for the adoption of a form of quota based on consumption of Egyptian cotton.

On Nov. 17 Queen Farida gave birth to a daughter, who received the name of Ferial

On Dec. 6 the Egyptian government accepted the invitation to send delegates to the London conversations about Palestine.

The question of defence dominated parliamentary discussions during the whole year. Contrary to custom, the two houses sat without summer vacation, rising only two days before the opening of the new session in November, to deal with the government proposals for meeting the cost of defence, estimated at £E.40 millions spread over five years, and of social reforms. These took the form of new taxation —a stamp duty, an income-tax, and succession duties—and were still under examination by parliament at the end of the year. (A. Mn.)

Area and Population :

Area, approx. 383,000 sq. miles (arable land 13,600 sq. miles).
Population (Census 1937) (preliminary figures) 15,904,525.

EIRE. On the coming into force of the new Constitution (Dec. 29, 1937), the British and Dominion governments announced that they were prepared to treat it as not effecting any fundamental change in the position of the former Irish Free State.

Conversations for the settlement of the dispute between Eire and Great Britain, begun in London on Jan. 17, 1938, concluded successfully on April 21. Agreements came into force on May 22 providing (1) that coastal defence stations at Cobh, Berehaven, and Lough Swilly should be transferred to Eire ; (2) that Eire should pay Great Britain £10 millions in final settlement of land annuities, pensions, and loan charges withheld since 1932, and that Great Britain should abolish penal tariffs on Irish produce ; and (3) that Eire should enjoy benefits granted the Dominions by the Ottawa Agreement Acts, 1932, while herself providing for review by the Prices Commission of existing tariffs on the principle of giving United Kingdom producers full opportunity for reasonable competition.

The Cobh defence station was transferred on July 11, and those at Berehaven and Lough Swilly on Sept. 29.

Dr. Douglas Hyde, ex-president of the Gaelic League, was elected President of Eire by agreement on May 4, and officially installed on June 25.

On May 25, Mr. de Valera's government was defeated by one vote on a question of civil service arbitration. A

general election took place on June 17, with the following result: Fianna Fáil (Mr. de Valera), 77, Fine Gael (Mr. Cosgrave), 45; Labour, 9; Independents, 7. This gave Mr. de Valera nine fresh seats and an absolute majority of sixteen. On June 30 he was re-elected prime minister with an unchanged government.

The new senate provided for in the constitution was formed on March 11, the Labour Party abstaining. The dissolution of the Dáil necessitated a new election, which took place on Aug. 17, with only slight changes.

On Oct. 17 Mr. de Valera in an interview reiterated his belief that the partition of Ireland makes the chances of co-operation with Great Britain in war very slight. He rejected a plebiscite, but offered local autonomy to Northern Ireland. As President of the League of Nations he sent, on Sept. 27, a telegram warmly supporting Mr. Chamberlain's peace effort.

Eire officially recognized Italy's Abyssinian Empire when her Minister on April 30 presented his credentials to the King-Emperor. (M. T.)

ELECTIONS. In Europe, Bulgaria, in March 1938, held her first general election since 1931, and returned to parliamentary government with a government majority of 48; and a plebiscite held on April 10 throughout Germany and Austria resulted in a 99 per cent endorsement of Hitler's action in Austria. In Czechoslovakia, municipal elections were held in May and June; and in December elections for the Slovakian diet resulted in a sweeping victory for the official and only list of candidates. In October, senatorial elections were held in France; municipal elections in Belgium; and a general election, in which no opposition candidates were allowed to be nominated, for the National Assembly of Portugal. In Poland, there was a general election on Nov. 6, the second under the 1935 Constitution, a senatorial election on Nov. 13, and municipal elections on Dec. 19. In November also, presidential elections took place in Turkey and Lithuania; and provincial and municipal elections throughout Sweden, the strength of the Social Democrats being much increased. In December a general election in Yugoslavia kept in office Stoyadinović's government; while at Memel the Germans polled over 87 per cent of the valid votes in a general election in which 97 per cent of the electorate took part.

In Egypt elections, resulting in the rout of the Wafdists, were held on March 31 and April 1; the elections for the National Assembly of the Hatay took place, after a two months' postponement, at the end of August; and in Turkey, at the municipal elections held in October, women for the first time exercised their right to vote. During this month Chile held a presidential election.

Within the British Empire, municipal elections were held in England and Wales (*see* LOCAL GOVERNMENT), and Northern Ireland held a general election on Feb. 9 on the partition issue, the Unionist cause registering a striking victory. Eire's second election within eleven months took place on June 17th, giving Fianna Fáil an absolute majority. South Africa held its elections on May 18, the United (Government) Party scoring a decided success; on June 8 the provincial elections held in Saskatchewan saw the first appearance at the polls, and the decisive defeat, of the Social Credit Party; and in New Zealand the general elections held in October resulted in the Labour Party being again returned to power.

A bill for the conducting of local elections by means of proportional representation was counted out in the British

By-elections to British House of Commons, 1938

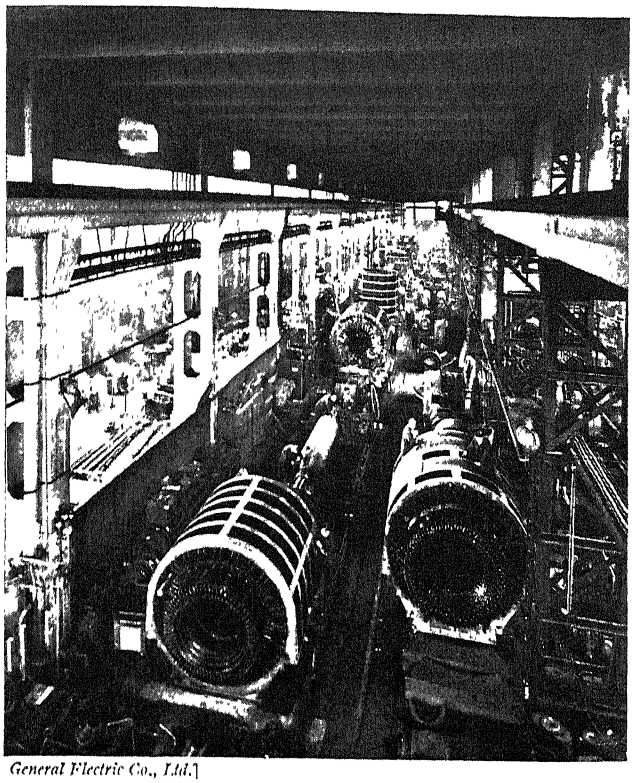
* 1929. † By-election, Jan. 1936.

House of Commons on Feb. 25 ; and in April it was officially announced that the rule put into force by the National Government in 1932 against the participation of Cabinet Ministers in by-elections would no longer be maintained, though this relaxation would not apply to the Prime Minister, Chancellor, or Foreign Minister. From the last general election in 1935 to the end of 1938, 58 by-elections (including those unopposed) have taken place, the government losing thirteen seats—ten to Labour and three to Independents. At the close of the year three by-elections were pending : East Norfolk, through succession to a peerage, and Ripon, York, W.R , and Holderness, York, E.R., through the decease of the sitting members. (L. H. D.)

United States. The net quantitative result of the 1938 elections was to increase the number of Republicans in the House of Representatives by 81, in the Senate by eight, and in the State governorships by thirteen. Contests of particular interest were those of : New York State where Democratic Governor Lehman was re-elected by a close vote over Thomas E. Dewey ; Pennsylvania where the Democratic candidates, Charles Alvin Jones for governor, and George Howard Earle for senator, were defeated by Republican Arthur H. James and James J. Davis, respectively ; Ohio where Governor Martin L. Davey and Senator Robert J. Bulkley, Democrats, were defeated for re-election by the Republican team of John William Brickner and Robert A. Taft ; Michigan where Democratic Governor Frank Murphy was defeated for re-election by Republican Frank Dwight Fitzgerald ; Wisconsin where Progressive Governor Philip F. Lafollette was defeated for re-election by Republican Julius Peter Heil ; Minnesota where Farmer-Labour Governor Elmer A. Benson was defeated for re-election by Republican Harold Stassen ; California where Republican Governor Frank F. Merriam was defeated for re-election by Democratic Culbert Olson.

ELECTRICAL ENGINEERING is concerned primarily with (1) the production, transmission, and distribution of electric energy, (2) the design, manufacture, and application of electrical equipment, (3) communication : telephony, telegraphy, radio, television, etc., (4) electric transport, (5) illumination, (6) a large group of miscellaneous applications of electrical theory.



In almost all countries the supply of electric energy has recently been reviewed from the point of view of war-time operation. In Great Britain, for example, studies have been made to protect generating stations and to supply important industrial centres by numerous lines, so that damage to one will not destroy the service. In the United States a Government committee produced standards for generator sets up to 50,000 kw, to place these on a more nearly mass-production basis. The generating capacity of the United States could not support the industrial system, or at best would be taxed to the utmost, if that system were to operate at full production capacity.

During 1938 the production of electric energy in Great Britain (23,000,000 million kw.-hr. in 1937) increased. The British grid system during its five years of operation has saved almost half its original cost. The production of electric energy for public use in the United States (120,000,000 million kw.-hr. in 1937) was less during 1938 until the late autumn when it rose to a weekly average greater than ever before.

Most new steam installations are superposed units, taking steam at high temperatures and pressures made possible by recent technical developments. Exhaust steam is used to operate old equipment.

Hydro plants, already highly efficient, continue to be built despite predictions of previous years in certain quarters that increased steam plant efficiency had outmoded them because of the large capital outlay usually required. In many European countries, where economic efficiency is not necessarily the basic consideration, hydro development also continues. Italy (output 15,000,000 million kw.-hr. in 1937) obtains 95 per cent of its energy from such plants, and the new programme of Russia (output 38,000,000 million kw.-hr. in 1937) calls for the installation of 5,500,000 kw. hydro capacity in the next five years. The Central Valley (California) project on which work started in 1938 will have a 400,000 kw. capacity. Several of the Russian projects are large ones.

Many design improvements and new developments were reported during 1938 in the manufacture of electrical equipment. An appreciable improvement in transformers, basic to the alternating-current power system, apparently will result from the use of spiral cores with the magnetic flux directed along the direction of rolling of the cold-rolled

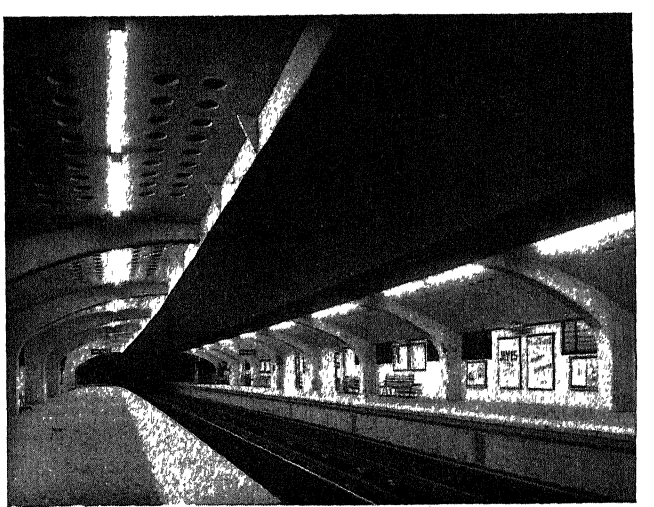
core material. Petersen coils or ground-fault neutralizers employed extensively in Europe, began to be used more widely in the United States. However, the device is limited in its usefulness and it is probable that the near future will see new developments in the field of relieving faults without having lines interrupted by opening of breakers.

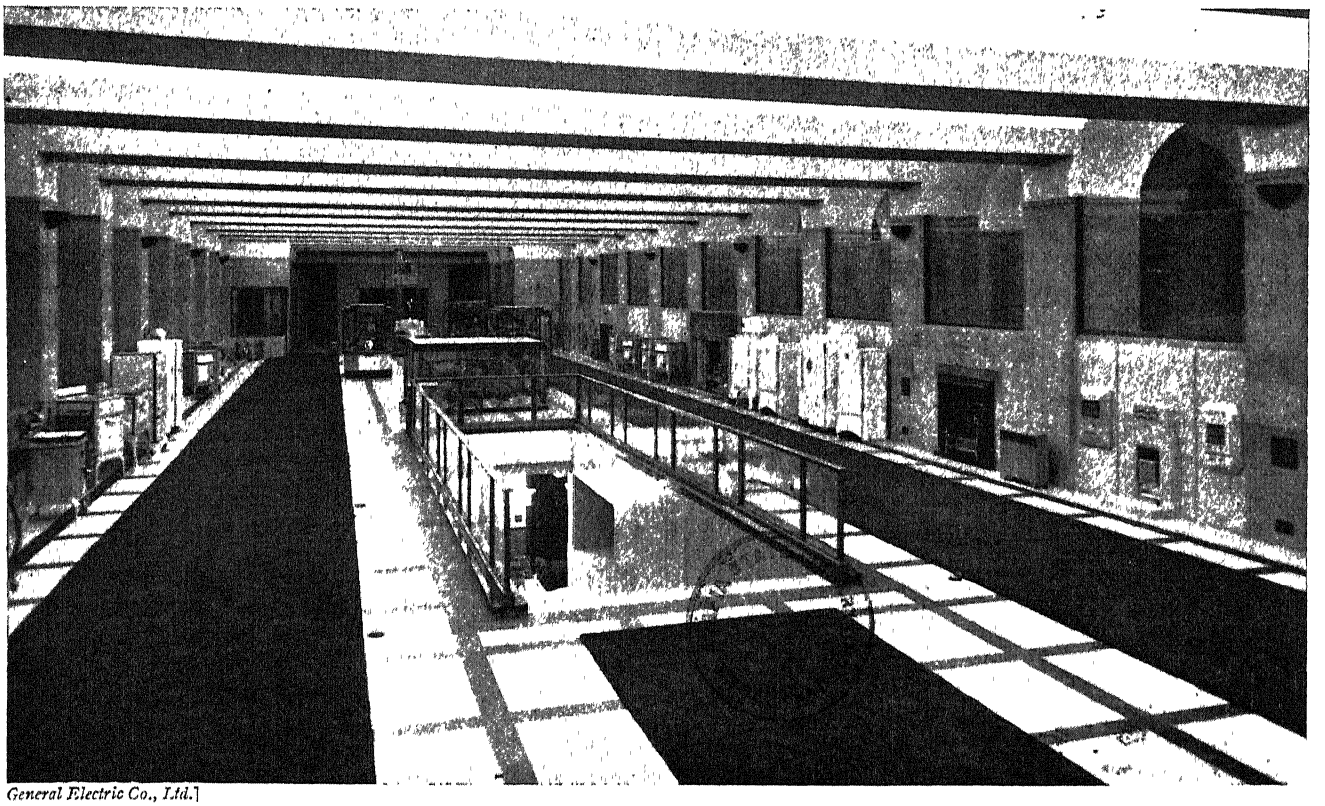
An apparently important development has been reported in Great Britain of a high-voltage cable, paper insulated and filled with an inert gas, ready for practical use at voltages as high as 132 kilovolts.

In the field of urban transport the return of the electric trolley seems indicated. High acceleration and deceleration rates, smooth control, and low weight per horsepower are characteristics of the technical design. The United States has even seen the tram making strides forward, but in Great Britain tram tracks are rapidly being grubbed up to make room for the trackless trolley or trolley-bus, which is greatly increasing in popularity. Recent improvements in design, inspired by the extensive use of petrol or oil-fired buses, are responsible for its wider acceptance.



Illumination. In illumination there are three developments worthy of note. First is the introduction on a commercial scale of fluorescent lamps. These are tubular lamps in which invisible ultra-violet radiation from a low-pressure mercury discharge actuates fluorescent powder which has been caused to adhere to the cylinder walls. The result is a lamp which produces coloured light far more efficiently (under proper circumstances) than present lamps. Consequently the fluorescent lamps are being marketed at low power ratings since much more illumination is available for a given energy input. Another result of this development is that a nearer approach to daylight has been obtained than was ever commercially available before.

The other two noteworthy developments in illumination are the rapidly increasing lighting of roads, often with the recently developed sodium or mercury illuminants, and the extension of the commercial sale of non-glare devices based on a polarizing principle. The latter development may, some time in the far distant future, eliminate the need for highway illumination, since it may permit the use of high-intensity headlights on motor cars without causing glare or momentary blindness to a driver of a vehicle coming in an opposite direction.



Telephone. The United States continues to contain about half of the world's 37 million telephones. The climax of a long development has been reached with the introduction there of a new hand-set, of improved electrical and mechanical design, and so compact that signal and all other auxiliary equipment is contained in the base on which the transmitter-receiver rests. Other developments in telephony include improvement in carrier transmission and further improvement of co-axial transmission in anticipation of the transmission of television programmes requiring several-million-cycle frequency bands. In telegraphy there have been no outstanding technical developments.

Radio. Television has been available to the public in parts of England for some time, and on a very limited scale in other countries The commercial production of television sets in the United States was announced for the Spring of 1939. It is an interesting commentary on engineering work there that complete television systems have been developed and discarded in favour of improved systems, with full reports appearing in the engineering journals and with engineering handbooks containing extensive sections on television, while the commercial sale of receiving sets has awaited for some years an improvement in business conditions. The basic system will be 441 lines interlaced, 24 frames per second.

ELECTRIC LIGHTING. Using fluorescent inorganic substances, such as sulphides, tungstates, and silicates, coated on the inside of glass tubes, developments of a radically new line of illuminants were rapidly advanced. Advantages include approximately double the luminous output per watt; less heating; the reproduction of daylight quality, and long life. In the United States where interest in sources of light has been immensely stimulated by the World Fair of 1939, five sizes of tubular fluorescent lamps were widely sold in tints of yellowish-white of 3,500° K. temperature equivalent, daylight of 6,500° K., blue, green,

General Electric Co., Ltd.]

pink, red, and gold. The tendency in Europe has been toward coatings of luminiscent phosphors in long small-bore tubing operated on high voltage. The " zeon " phosphor-coated tubing in numerous colours was introduced in North America, particularly to decorate buildings of the New York and San Francisco Fairs. Annual sale of large tungsten-filament lamps in the United States for the first time passed the 500 million quantity and, aided by smaller bulb sizes and reduced prices, a production is tentatively scheduled for an increased consumption of some 15 million lamps annually.

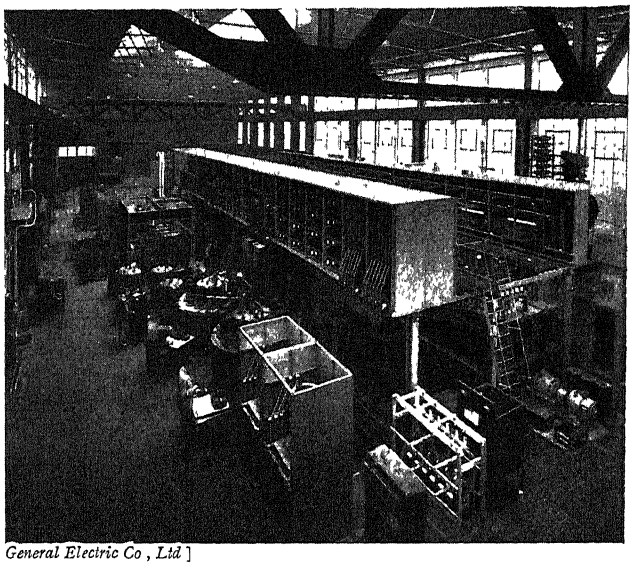
The bipost base on larger wattages continued to replace the screw-shell base, while the fluorescent lamps introduced a new line of spring sockets accommodating projecting pins on the ends of the lamp bulb. New lines of aluminium interior neck-coated projector and reflector lamps were standardized. This integral combination of bulb and reflector seemed accepted for motor-car headlighting, but actual usage was postponed. A new 250-watt high-intensity mercury-vapour lamp, operating at some six atmospheres pressure in a quartz capillary tube, was standardized, while in the United States the line of similar lamps was expanded to include the 100-watt clear, also black bulb ultra-violet and Type S-4 ultra-violet lamps, plus both high- and low-pressure 400-watt types. A 500-watt, 25,000-lumen capillary mercury arc lamp was developed to light European airports. The 1,000-watt capillary water-cooled mercury lamp was standardized for photo-engraving and projection service, this at 65 lumens per watt, the highest efficiency bulb type light source yet developed. Transmission of pictures over the ordinary telephone lines was made possible through the introduction of the neon crater lamp, and the brightness of motion pictures increased through an extended use of high-intensity direct-current arc carbons.

Lighting Practice. The Better Light—Better Sight educational programmes of North America and intensive improvements in school lighting and eye conservation extended throughout the world, aided by international co-operation through the Illuminating Engineering Societies and the International Commission on Illumination. Adequate wiring was recognized as vital to an extension of lighting, and committees functioned enthusiastically to revise wiring standards. Coloured light became feasible and popular through usage of fluorescent lamps, while a notable outdoor lighting innovation consisted of high-intensity mercury floodlighting of trees and green shrubs. This, together with flush ceiling lens plates, or down-lights, and the use of mercury lamp projectors for blue and green colour effects, characterized the equipment for the New York World's Fair, while black light and fluorescent effects and sodium lamps were features planned for the San Francisco Fair. Phosphorescent wall papers and paints appeared; also translucent plastics for novel luminaries.

Short-wave ultra-violet lamps continued to grow in usage for reducing the pathogenic organisms on utensils such as drinking glasses, or in the air in sick rooms, hospitals, and places of congested human occupancy, and to reduce spoilage of foods. In street lighting some 700 miles of mercury lighted thoroughfares further established the mercury lamp in Britain, while in the United States some 5,000 additional sodium vapour lamps were installed on highways.

French and British lighting education was advanced through reconstructed lighting demonstration rooms in numerous cities. Under governmental urge the manifold advantages of better lighting were being developed in Germany through the Light-Technical Society. New foot-candle standards issued in Britain went far to unify Western European standards, although American industrial foot-candle practice remained at considerable higher levels. Discussions at the Vienna World Power Conference of 1938 disclosed a constantly enlarging horizon for artificial lighting the world over, with no saturation of markets, nor stagnation of research remotely in sight.

ELECTRIC TRANSMISSION AND DISTRIBUTION. The art of electric power transmission over long distances was not significantly advanced in the year 1938 so far as actual installations are concerned, but research in direct-current transmission has been continued, and at least two projects are contemplated for the alternating-current transmission of hydroelectric power over distances greater than those of lines now in existence. These latter projects will undoubtedly utilize voltages in excess of the 287 kilovolts of the Boulder Dam–Los Angeles line in the United States, and so will represent pioneering farther into the domain of high-voltage construction and operating technique.



A new single-circuit line to operate in conjunction with the present double-circuit Boulder Dam line is now under construction and is scheduled to be put into operation during 1939. Bids for the steel towers and aluminium steel-reinforced cables for a 220-kilovolt line between the new Bonneville Dam and Vancouver, Washington, were placed during 1938. The 132-kilovolt British grid has been extended, and there has been a normal growth of high-tension mileage in France, Germany, Italy, Scandinavian Countries, and South Africa.

In the U.S.S.R. the carefully planned programme of power development and utilization has materialized phenomenally during the past ten years. High-voltage transmission is standardized at 110 and 220 kilovolts and the new equipment is getting to be more largely of Soviet manufacture. A very high proportion of the power transmitted is used in industry and an increasing proportion in agriculture. The general plan has been the development of centres of power production, and the more recent development of the plan has been the integration of these centres into an interconnected unitary system. The load factor on generating stations and transmitting facilities has risen to a high figure. One of the factors contributing to this high-load factor has been the adoption of Sunday working schedules and the regulation of factory loads to stabilize the load curves. The top of the evening peak was cut off appreciably by changing to daylight-saving time.

The 220-kilovolt cable line in Paris and the 132-kilovolt lines in New York and Chicago have continued their satisfactory operation and a 125-kilovolt cable line has been installed in Germany.

Notable advances have recently been made in reducing the cost of the production and distribution of electric power. These economies begin at the power house where topping, or superimposed, turbines utilizing steam at high pressures have made possible the production of 25 to 50 per cent more power with the same fuel consumption. The newer and more efficient stations and their associated transmission facilities are operated at high load factors and close to unity power factor, with the less efficient stations taking up the peak increments and the reactive power.

In distribution systems, economies have been effected in several ways. Perhaps the most noteworthy of these is the almost universal application in Great Britain of the tap-changing transformer to increase the utility of existing branches of the secondary and distribution grids. Practically all the large transformers have been fitted with tap-changing gear. The extension of this idea to smaller distribution transformers is now taking place rapidly. In these cases, a simple design of tap-changing gear with mercury switches is placed on the tops of the existing transformer tanks. New designs of induction regulators

General Electric Co., Ltd.]
NEW EXTENSION AT THE G.E.C. RECTIFIER WORKS, WITTON, BIRMINGHAM THE TEST BAY

with increased voltage ranges and kilovolt-ampere ratings have been developed in Germany and are being applied in several countries for purposes similar to that of the tap-changing transformer. Similar economies are seen in the United States in the application of tap-changing transformers and induction regulators and also of phase-shifting transformers.

In cable systems, a new temperature-indicating device, also developed in Germany, makes it possible to read the temperatures of the various sections of cable at a central point in order that the load dispatcher may safely load each cable section to the limit of its capacity.

Perhaps the most notable advance in the art of distribution in 1938 was the installation in New York City of a 15-kilovolt gas-filled cable. This cable has properties similar to the oil-filled type and its life in terms of sustained dielectric strength is expected to be between that of oil-filled cables and the ordinary impregnated-paper type.

Better power factors in both high- and low-tension lines have resulted from the further application of shunt static capacitors, thus reducing the power losses. In Berlin an important change has been made in the distribution system to allow greater loads. This change utilizes 4-wire 380-volt distribution in place of the 3-phase 220-volt system.

Greater continuity of service has resulted from better operating techniques and from the installation of protective devices. For example, in Britain a way has been devised to make additions to the 33-kilovolt secondary grid without interrupting the service. In the United States, the increasing adoption of protector tubes has produced a notable improvement in the reliability of distribution systems, and these tubes have been applied during 1938 to a 220-kilovolt system.

Rural electrification is receiving greater attention than ever before both in Europe and in America. The early solution to the problem was to provide small direct-current engine-driven generators with auxiliary storage batteries. More recently there has been an attempt to extend distribution to these communities from the more efficient steam and hydroelectric stations by means of transmission lines. The initial expense necessary to provide such transmission and distribution facilities evidently cannot, in general, be borne by the rural tenants, and for this reason government funding has played an almost decisive part in setting the

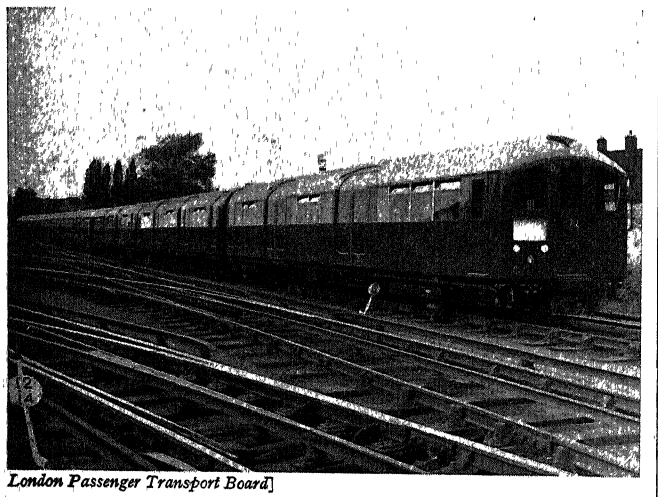
project in motion. In France, the government has provided over forty per cent of such financing In the United States, the Rural Electrification Administration has announced, during 1938, appropriations for power-line construction and wiring loans to be applied in the rural communities of 26 states. The total appropriation to date is $122 millions, of which these latest allotments constitute about $13 millions. It is estimated that more than 40,000 farm families now without electric power will be served by these new projects.

The protection and rapid repair of transmission and distribution systems in case of war are matters which have received attention during 1938, especially in Europe. In one country special crews are trained to wear gas masks and protective suits while working on the lines. (*See* also ELECTRIFICATION, RURAL.)

BIBLIOGRAPHY. L. F. Woodruff, *Electric Power Transmission and Distribution*, 1938; O. G. C. Dahl, *Electric Power Circuits* (Power System Stability); *International Conference on Large High-Tension Systems*, Paris, 1937; *Transmission and Distribution of Electrical Energy*, 1937.

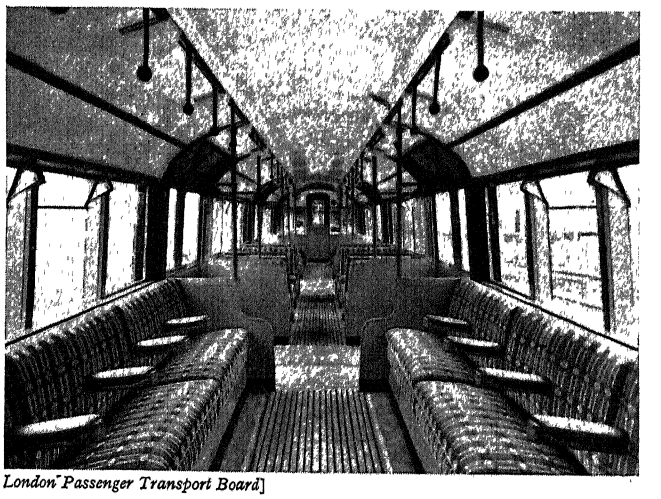
ELECTRIC TRANSPORT of late years has been diversified into four main categories. These are: (1) electric trams and, in America, interurban railways; (2) electrically operated underground tubes and, in some countries, elevated lines; (3) electrified trunk line railways, (4) electric trackless trolleys or trolley buses. Another classification should perhaps be added to include (5) Diesel-electric buses and trains. While all these types of electric transport have certain points in common, their most recent developments have followed somewhat divergent lines.

Electric Trams. Although the electric tram was the first form of electric transport to be extensively developed, it has been more or less on the defensive in recent years as a result of the remarkable development of motor transport. In the first place, the private motor-car, through superior comfort and convenience, has drawn away a substantial amount of patronage. In the second place, the motor-bus, and more recently the trolley bus, through flexibility and economy, have won prominent places as substitutes. This applies also in the case of many interurban electric railways in America.



The extent to which these effects have been felt has varied in different countries, but it is not too much to say that they have been experienced to some extent everywhere. Among the larger cities of the world, for example, Paris has now abandoned all its surface electric lines, London is planning to abandon them, and New York has abandoned a considerable part of them In these cities, of course, the underground electric railways constitute the backbone of the local transport system. The motor buses or the trolley buses are used on the surface as feeders and especially for short journeys. In cities of medium and smaller size, motor buses and trolley buses have in numerous instances replaced trams in supplying all local transport service.

While there has been a substantial shrinkage in the mileage of electric surface-railway track in recent years, there is a strongly held opinion among many transport authorities that the electric tram still has definite advantages for handling heavy loads. For that reason a vigorous attempt has been made to modernize it and regain some of the business lost to other forms of transport.



The first step in this direction was the development in the United States of a new type of light-weight, fast, silent tram or street car under the sponsorship of the Electric Railway Presidents' Conference Committee. Rubber springing and improved control and braking equipment are outstanding features of the design. Since the first cars of this type were built in 1936, a total of more than 800 have been placed in operation in ten cities in the United States and two in Canada. Revenue increases as high as 33 per cent have been obtained. Schedule speeds have been increased as much as 14 per cent. Noise has been greatly reduced and accidents have been fewer. A sample car of this type is now under construction in Italy, and keen interest in the design has been shown in numerous other countries.

Efforts to develop better trams or street cars, however, have not been confined entirely to the Electric Railway Presidents' Conference Committee. Fast, streamlined cars with unusually comfortable passenger accommodations have been put in service recently in Atlantic City, Cincinnati, Buenos Aires, Milan, Brisbane, Moscow, Oslo, and elsewhere. While it cannot be expected that these modernization activities will restore the electric street railways to the position they held before the advent of the motor-car, the resultant improvement in service has already won wide popular approval.

City Electric Railways. Recent developments in the field of electrically operated underground and elevated railways have been of particular interest. Experiments have been conducted with light-weight, articulated trains wherein adjacent car bodies are supported by a single truck placed between them, and with resilient wheels with rubber between the tread and the hub. A new type of car has been developed for use in Philadelphia in which many features have been introduced for the comfort of passengers. One

London Passenger Transport Board]
TRAIN BUILT IN 1938 FOR THE LONDON UNDERGROUND

London Passenger Transport Board]
INTERIOR OF LONDON UNDERGROUND TRAIN BUILT 1938

is a new arrangement for interior lighting, with continuous fixtures extending the full length of the ceiling on each side of the car over the seats. Another innovation is a changeable station indicator, installed below the ceiling opposite the centre doors. This is so arranged that it displays the name of the next station in illuminated letters. The metal box in which the sign is installed is fitted on both faces with electric clocks. New cars have also been purchased by the Interborough Rapid Transit Company in New York City and by the London Passenger Transport Board. The former are more or less conventional in design while the latter reflect the modern tendency toward streamlining.

Experiments began several years ago, both in London and in New York, with the use of long sections of welded rail to eliminate the noise and jarring that result from the passage of wheels over rail joints where the ends are not in close and accurate contact. The London Passenger Transport Board has now gone a step farther by attaching perforated asbestos board to the iron shells of its tube railways to absorb the noise of passing trains. It is said that the combination of welded joints and sound-absorbing linings has reduced the noise by about 65 per cent.

During the past year extensions have been made to the underground systems in New York, Philadelphia, London, Paris, Moscow, and Buenos Aires. A notable feature of the new Moscow underground is use of marble columns, polished steel, sculpture, and mosaics for decorative purposes. Construction of new undergrounds has been started in Munich and Chicago. Similarly there have been numerous extensions of trunk-line railway electrification, particularly on the continent of Europe, but they have involved comparatively few new technical developments.

Trackless Trolleys. Fastest growing of all the forms of electric transport is the trolley bus or so-called " trackless trolley ". Installations of this type were first made many years ago, but they did not turn out particularly well owing to limitations in the design of the vehicle. During the last ten years, however, many advances have been made in trolley-bus design and the newer vehicles are proving extremely satisfactory. About 2,500 of these trolley buses are now in service in Great Britain, while there are about 2,000 in the United States and Canada.

Many of the trolley-bus systems in operation in the United States and Great Britain have expanded their operations in recent years by the addition of more vehicles. The largest single system in the world is now that of the London Passenger Transport Board with 1,026 vehicles and 198 miles of route. An additional 159 miles of route, which has been authorized but not yet opened for traffic, makes the contemplated total for London 357 miles. The second largest system is that of the Public Service Co-ordinated Transport in New Jersey, with 583 vehicles and 287 miles of route.

From the technical standpoint the design of the vehicles operated by the Public Service Co-ordinated Transport is particularly interesting. Under the name of " all-service vehicle " this company operates a combination trolley bus and petrol-electric motor bus using either its own power or power obtained from overhead electric wires. The added cost and extra weight involved in having duplex sources of power, however, will probably tend to limit the use of this type of vehicle to places where great flexibility is desired.

Petrol-electric and Diesel-electric Transport. Although petrol-electric and Diesel-electric vehicles are not forms of electric transport strictly comparable with those already mentioned, they have some points in common with them. The petrol-electric bus was first developed about ten years ago to get away from the frequent gear shifting required in the operation of mechanically-driven buses in frequent-stop service. While the early petrol-electric buses were successful in accomplishing this purpose, they had some rather serious disadvantage owing to the fact that the generator output was not sufficient at the most economical speed of the petrol engine. With the development of the Diesel engine, however, it became possible to accomplish the desired result more satisfactorily. Some 200 Diesel-electric buses are now in operation in the United States and Canada.

Of particular interest is the development during the past year of a Diesel-electric bus of virtually the same capacity as the ordinary tram. To make possible the operation of a unit of this size, the vehicle steers with both front and rear axles and is hinged in the middle to accommodate changes of street gradient.

Diesel-electric power has been widely used in recent years for the operation of shunting engines at railway termini. The same type of power has also been used for many high-speed passenger trains such as the Burlington's " Zephyr ", and Santa Fe's " Super Chief ", and others.

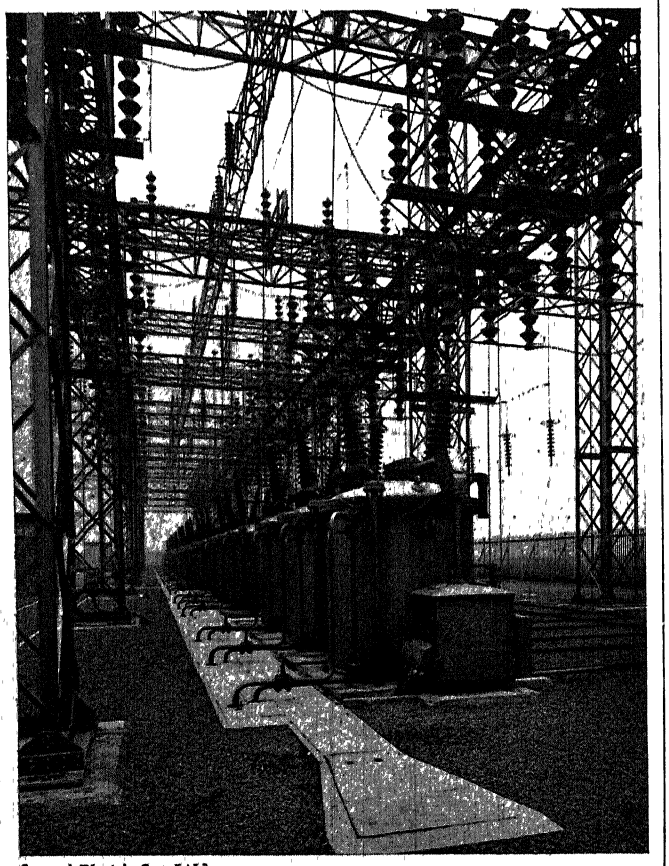
* Total for three systems.
† Total for five systems.



ELECTRIFICATION, RURAL. In Great Britain, progress resulted from the gradual extension of rural electric distribution lines It is estimated that more than 36,000 farms were receiving electricity in 1938 This figure may be contrasted with 30,000 in 1937, 25,000 in 1936, and 4,000 in 1932. Since in Great Britain there are reported to be nearly 450,000 farms and small holdings of over 1 acre, it will be seen that only a small proportion of the total is as yet connected

During the latter part of 1936, and in 1937, sharp increases in the price of materials and a shortage of supplies impeded the extension of rural lines The subsequent fall in the prices of conductor, poles, and supplies served to accelerate construction in the latter half of 1938.

The British Electrical and Allied Industries Research Association reports that it has taken the first step towards the centralization and co-ordination of research, experimentation, and development in rural electrification in opening a new department to deal with this subject. Rural electrification in Great Britain has been in a trial period, but it is anticipated that developments under way will result in its expansion along many lines. It is hoped that the extensive research now under way will lay a firm foundation for future progress.

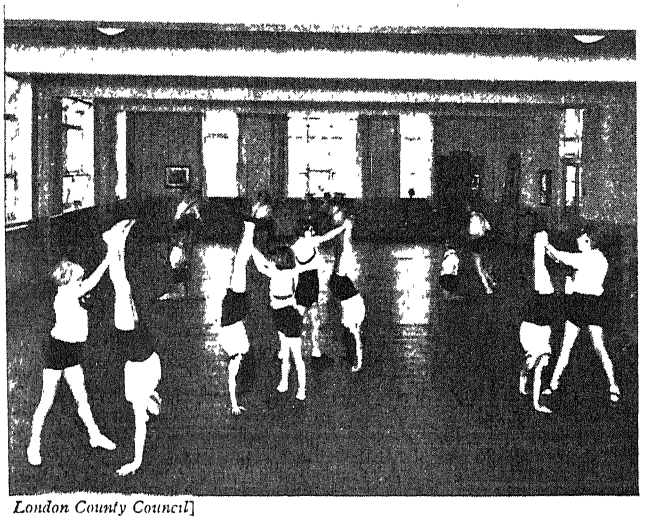
In connexion with the rearmament programme and the decentralization of industry resulting from threats of war, it is interesting to note that quite a number of small new industrial enterprises, including aerodromes and munition works, were added during 1938 as customers of rural electric lines.

In the United States, increased Federal funds available for rural electrification, and a substantial increase in the number of rural customers served by government financed lines, marked the progress of rural electrification in 1938. There was a substantial amount of rural line construction by the private utilities, although the 1938 total fell considerably short of the 40,000 miles constructed in 1937 It is estimated that over 1,450,000, or 21 per cent, of the farms in the United States were receiving service on Dec. 31, 1938—an increase of over 200,000 for the year.

General Electric Co., Ltd.]

HAMS HALL SUB-STATION, BIRMINGHAM, WITH NINE 1,500,000 K.V.A. OUTDOOR-TYPE OIL CIRCUIT BREAKERS, 132,000 VOLTS

The satisfaction of farmers with their new electric service produced such a demand for assistance in electrifying unserved rural areas that the 75th Congress voted $100 millions in addition to the $40 millions envisaged in the Rural Electrification Act of 1936, for loans for rural electrification in the fiscal year ending June 30, 1939.



It is estimated that at the end of 1938 there were over 150,000 customers receiving electricity over lines financed by the Rural Electrification Administration. Over 100,000 of them received electricity for the first time in 1938. Prior to the Federal government taking an active part in assisting the farmer to obtain electricity, practically all farms served with electricity were served by private utilities. As a result of the activities of the Tennessee Valley Authority and those of the Rural Electrification Administration, a small but increasing percentage of farms are being served by farmer-owned and controlled distributing systems.

Increasing emphasis during the year was placed upon developing increased use of electricity in rural areas. The need to adapt many kinds of farm equipment to electric power was recognized. New uses were found for electricity and there was a marked increase reported in the sales of electric equipment in the rural areas.

ELEMENTARY EDUCATION. The most active developments in elementary education in Great Britain during 1938 are associated with the national campaign for children's health and the setting up of the National Fitness Council. Expenditure incurred by the local education authorities in providing or aiding the provision of gymnasiums, playing fields, community centres, recreational institutions, and other similar facilities for social and physical training now ranks for a fifty per cent grant from national funds.

While these facilities are intended for older children and for adults, the elementary schools have felt the benefit. New schools are providing open-air class-rooms, gymnasiums, playing fields, and provision for meals. Camp and holiday schools are increasing. The milk scheme, which provides cheap milk for school children (free milk in necessitous cases), is becoming universal, and already ninety per cent of the children are in schools operating the scheme. In London, a three-year programme includes the provision of a green belt of playing fields, with class-room accommodation, so that all pupils may spend one whole day each week as much as possible in the open air.

Yet the battle is far from being won. There are still over 900 black-listed schools surviving from the deplorably low standards of the past, and many more nearly deserve this condemnation. Nursery schools grow with disappointing slowness and number only about a hundred. The head master of a school in South Wales has drawn a haunting picture of the children in a Special Area, " underfed, poorly clad, badly shod. . . . The children of these valleys of forgotten people do not know what real childhood means. They have no presents and no toys; they have neither Sunday dinner nor Sunday clothes. . . . Their homes are mere hovels." Statistics may show an average improvement, but some children get none of the advantages.

London County Council]
PHYSICAL TRAINING AT A SENIOR ELEMENTARY SCHOOL

The task of reorganizing the elementary school, begun ten years ago, is still proceeding. In rural areas, only 38 per cent of the children are affected; in urban areas the percentage is twice as great. The difficulties are greater than was anticipated. slum clearance schemes necessitate new schools, and the dual system makes re-planning more complicated. The Act of 1936 raises the school-leaving age to fifteen after Sept. 1939, but exemption at fourteen may be granted by the local authorities. There is now a large measure of agreement between the authorities defining the conditions governing such exemptions, many occupations have been declared undesirable, and the authorities will impose requirements of facilities for further education and restrict the hours and conditions of work in permitted occupations, so that the employment of children under fifteen may turn out to be exceptional.

The expense of building new schools, or altering old ones, led the Board of Education to raise the building grants to the local authorities from twenty to fifty per cent in the case of contracts entered into by Dec. 1940. The local authorities, faced with rising prices, pleaded that the time allowed was too short, and the Board has extended the period for three years "where an authority could show that it had made reasonable progress with the task of reorganization before the original date."

To meet the new burden placed on religious bodies which provide their own school buildings, the Act of 1936 empowered local authorities to make building grants to religious bodies for new schools and alterations. Such grants may be from 50 to 75 per cent of the cost. Schools assisted in this way would still be denominational, and managers are allowed to apply for a number of teachers to be "reserved", so that the particular religious instruction given in the school may be safeguarded.

In most places the arrangements made between local authorities and religious associations have been in accordance with the Act. The general solution is that an authority makes a grant of 75 per cent, and allows the number of "reserved" teachers to be determined by the number of children for whom the religious instruction specified in the trust deed is required. But in a few districts the authorities have refused grants, and in Liverpool an acute situation has arisen. The voluntary schools in the dockside area, many of them black-listed several years ago, are said to be in an appalling state, and the Board is demanding immediate action. The Roman Catholics declare their inability to build without grants, and the city council refuses to make grants. The Board is not satisfied with the Council's proposals, and has taken the unusual step of "withholding" a part of the education grant as a penalty for delay. Already £90,000 has been withheld; in a full year the amount will be twice that sum. The feeling that has been aroused threatens to make council schools in Roman Catholic districts an unpopular provision

It is hardly surprising that the magnitude of building programmes, the work of reorganization, and the preparations for raising the school-leaving age should have almost completely engrossed the attention of educationists. The complaint has been expressed that the content of education receives little notice. Mr. H. G. Wells in 1937 attracted much discussion by his plea for a curriculum designed "to give future citizens a picture of the world to which they have to go". At the 1938 meeting of the British Association, he returned to the attack A Committee of the Association had made inquiries in the schools, and Mr. Wells, expressing his dissatisfaction with the result, paraphrased the replies as "we teach, but we don't teach anything definite. Teaching is the important thing, not what is taught". The complaint is unfair. The curriculum is actually more under discussion than ever. Physical education has made remarkable progress, and its content is much better organized. Science teaching is becoming more general with the provision of laboratories in the new schools, and the content is certainly more closely related to modern life. History and geography have been considerably influenced both by the trend of world events and by such bodies as the Association for Education in Citizenship. Mr. Wells gives the impression that he wants a uniform syllabus in every school; the teachers prefer the view frequently expressed by the Parliamentary Secretary to the Board of Education, that the new senior schools should be left free "to mould their curriculum to meet the needs of modern society".

EMIGRATION: *see* POLITICAL MIGRATIONS AND REFUGEE MOVEMENTS.

ENDOCRINOLOGY. The Endocrine Basis of Diabetes. Recent years have seen a great increase in our knowledge of factors concerned in the disease commonly known as diabetes and more precisely as *diabetes mellitus*. It is now possible to draw some general conclusions.

The chief symptoms of the disease are intense thirst and increased appetite, often associated with a fall of body weight and considerable wasting; the amount of urine excreted daily is greatly increased and the urine contains abnormal constituents—glucose (dextrose or grape sugar) and the so-called "ketone bodies". The "ketone bodies" are *beta*-hydroxybutyric acid ($CH_3CHOHCH_2COOH$), acetoacetic acid (CH_3COCH_2COOH), and acetone (CH_3COCH_3). Glucose, together with a trace of *beta*-hydroxybutyric and acetoacetic acids, is normally present in the blood, but in *diabetes mellitus* the amount of glucose and of "ketone bodies" present in the blood substantially increases.

Untreated *diabetes mellitus* is often fatal, death being due to the toxic effect of the "ketone bodies" which accumulate in the blood and tissues. Because *beta*-hydroxybutyric and

acetoacetic acids are acidic substances, a condition of "acidosis" is usually found.

Pancreas. The treatment of *diabetes mellitus* by the subcutaneous injection of the hormone "insulin" has been strikingly successful. This hormone was discovered by Banting and Best in 1922, and its introduction into medical practice completely revolutionized the treatment of diabetes. The injection of insulin into a diabetic patient causes a rapid diminution of the amount of sugar in the blood and, under suitable circumstances, in the complete disappearance of sugar and "ketone bodies" from the urine. If a large dose of insulin is given, the amount of sugar in the blood may fall considerably below its normal value (0·1 gm. per 100 c.c) and "hypoglycæmic convulsions" may ensue. As the condition of hypoglycæmia following a large dose of insulin may prove fatal, it is necessary to ensure that the amount of insulin and the amount of sugar-forming food given to a diabetic patient are so balanced that the amount of sugar in the blood never falls far below its normal value, nor indeed ever rises very far above it.

The effect of a single injection of insulin passes off after a few hours, but recently Hagedorn has introduced a combination of protamine and insulin which is absorbed from the subcutaneous tissues much more slowly than ordinary insulin, and therefore acts for a much longer time. A mixture of zinc salts with protamine and insulin, which acts for a longer time than Hagedorn's protamine mixture, has been recently prepared by D. A. Scott of Toronto.

Insulin was obtained in a crystalline form by Abel in 1926; it appears to be a protein, and all attempts to degrade it into smaller molecules which retain its activity have so far failed. Recent work has shown that zinc is normally present in crystalline insulin to the extent of about 0·5 per cent, and preparations of insulin which are free from zinc and a small number of other specific metals cannot be obtained in crystalline form.

There is good evidence that insulin is an internal secretion of the islets of Langerhans of the pancreas. The isolation of insulin from the pancreas, and the successful treatment of *diabetes mellitus* by this substance, provide evidence for the theory that diabetes is due to deficient secretion of insulin by the islets of Langerhans. Recent experimental evidence has shown that such a simple theory cannot explain all the facts.

Pituitary Gland. In 1930–31 B. A. Houssay and his collaborators clearly demonstrated that experimental diabetes, produced by surgical removal of the pancreas, may be substantially attenuated or even apparently cured by removal of the *Hypophysis cerebri*, or pituitary gland. The pituitary gland is divided into anterior and posterior lobes, and the removal of the anterior lobe in a number of species of animal is as effective in diminishing the severity of experimental diabetes as removal of the whole gland. As a corollary to Houssay's observations, it has been found that the injection of extracts of the anterior lobe of the pituitary gland into normal animals can produce a condition similar to human diabetes, and it has proved possible to produce a permanent condition resembling *diabetes mellitus* by treatment with pituitary extract for only a short period. The evidence available at present suggests that the secretions of the anterior lobe of the pituitary gland and of the pancreas act antagonistically on the metabolism of sugar, and that the derangement of metabolism recognized as *diabetes mellitus* may result either from a deficiency of the internal secretion of the pancreas (insulin) or from a greatly increased secretory activity of the pituitary gland.

When an animal is treated with a suitable pituitary extract it becomes insensitive to the action of insulin, and the administration of a large dose of insulin to such an animal is followed by little or no fall of the blood-sugar level. The recent demonstration that blood from particular cases of *diabetes mellitus* resembles pituitary extracts in ability to inhibit the action of insulin provides strong support for the belief that some cases of *diabetes mellitus* are not due merely to a deficient action of the islets of Langerhans, but probably due to an over-functioning of the pituitary gland. Nothing is yet known as to the nature of the active substances secreted by the anterior pituitary gland.

Adrenal Glands. The adrenal glands are also concerned in the metabolism of carbohydrate. These organs, usually two in number, resemble the pituitary gland in consisting of two distinct portions. The inner part—the adrenal medulla—secretes *adrenaline*, a substance which has been obtained in crystalline form and which has many powerful pharmacological actions. The injection of adrenaline into a normal animal causes, among other effects, a rapid rise of blood sugar-level, and it is believed that variations in the rate of secretion of adrenaline by the adrenal glands assists in controlling the level of the blood-sugar. Nevertheless, an animal may be completely deprived of adrenal medullary tissue without exhibiting any very obvious symptoms.

The outer portion of the adrenal gland—the adrenal cortex—is, on the other hand, a tissue, the presence of which is essential for the life and well-being of a normal animal, and removal of the adrenal cortices usually results in death within a comparatively short time. During the last few years extracts of the adrenal gland have been prepared which contain the relevant hormone, *cortin* or *corticosterone*. Frequent administrations of this hormone can keep an animal alive indefinitely after both adrenal glands have been removed. Recently it has become clear that removal of the adrenal glands results in the attenuation of the symptoms of experimental diabetes, and this effect is apparently due to removal of the cortical tissue and not the adrenal medullæ. If an animal is deprived of both adrenal glands and given frequent injections of the hormone of the adrenal cortex in such amount as to keep it alive indefinitely, subsequent removal of the pancreas produces a much less intense diabetes than normal. An animal from which the adrenal glands have been removed and replaced by suitable daily injections of the hormone will survive removal of the pancreas much longer than a normal animal.

The recent demonstration that the administration of crystalline corticosterone to normal animals may result in striking changes in the amount of carbohydrate (glycogen) stored in the tissues, strengthens the belief that the hormone of the adrenal cortex is intimately concerned with the control of sugar metabolism. The mechanism whereby the adrenal cortex exerts its striking effects on the general metabolism remains to be determined. (A. S. Pa.) (F. G. Y.)

ENGLISH LITERATURE. One of the most charming books of 1938 was *The Silent Traveller in London*, by Chiang Yee, a Chinese gentleman. He had some pertinent things to say about the state of current literature in England. "Publishers", he says, "seem to encourage authors to write strongly on the topical subjects as if they were journalists getting news for papers. And publishers, authors, and journalists seem to work together to cater for a public avid over current events. For instance, during the Italo-Abyssinian war, a vast number of books came out on Abyssinia as well as on Italy in about six months, and then on Spain, Austria, China, Japan, Germany, and now Czechoslovakia and Poland. It seems as though, if there were not so many aggressors, publishers, authors, and journalists might die from starvation! It's an ill-wind that blows no one any good".

The diagnosis is incomplete. The publishers are but a medium. The public follows its dominant interests and will read those writers who share them and have the relevant information. Poets, to-day as ever, are doubtless born; but they have to be made as well. If, during 1938, there was little first-class writing on enduring themes and very little poetry, if the elder poets (with the exception of Mr. de la Mare) were almost silent, there are many contributory causes. Some authors capable of non-ephemeral work are obsessed into surrender, some oppressed into silence, some, perhaps, merely do not publish for lack of an audience. At all events, the fact is there, and the scene in 1938, as in the years immediately preceding it, was largely dominated by books about the political turmoil.

Amid the swarm of these a few stand out. For sheer power of writing, variety of interest, and mingling of the flavour of personality with objective record, Mr. Bruce-Lockhart's *Guns or Butter?* stands out above the rest. He has, in a succession of books, mingled personal autobiography with the changing political scene—this one deals largely with Czechoslovakia since the war. He is no violent partisan about systems, except in so far as they work cruelly or kindly, efficiently or inefficiently; and it is probable that the historians of the future may find the books of this gifted, humane, and humorous vagrant more helpful towards a recovery of our day than many books more intensely political, controversial, and documented. Amongst the horde of books which were rushed into print with impressions while they were still fresh were Mr. Douglas Reed's *Insanity Fair*—a title which had reference to Europe in general and Germany in particular—and Oscar Dutch's *Thus Died Austria*. A journalistic-literary experiment of a novel kind, and extremely effective, was *Four Days*, edited by Lord Killanin. The "four days" are those days in September when the fate of Europe and the world hung in the balance, while the leaders of the great Western powers were having their final talks, and no man, save perhaps Herr Hitler, could be sure whether at the week's end peace, at least for a time, would be saved, or once more the lands would be ravaged, the cities bombed, and millions of young men would march to a fruitless death. The editor conceived the notion of collecting from qualified observers in the capitals chiefly concerned their impressions of those fateful days while their memory was still vivid in the public mind and their own: an extraordinary expedition was shown in the publication of the book.

Historical, biographical, and autobiographical books were even more numerous, and, in many instances, as popular. These sharp divisions into categories are rather arbitrary; what is there in common, except that they are each written around a single personality, between Miss Yvonne ffrench's delightful study of Ouida and R. J. Mitchell's monograph on the little-known but important fifteenth-century statesman John Tiptoft? Into whichever pigeon-hole it may be pushed, there can be no doubt that the last volume of Mr. Winston Churchill's *Marlborough* was the most outstanding work of the year in each category. Marlborough in the last stages of his military career (which included Malplaquet) is portrayed powerfully and fairly, and his personal vindication continues; but even were Marlborough in the background, the work would be memorable because of its brilliant pictures, and skilful disentanglements, of the squalid and complicated domestic politics of Queen Anne's reign. A great book was brought to a memorable close.

H. Montgomery Hyde's book on Princess Lieven drew attention once more to that extraordinary figure, who naturally reappeared in F. K. Reichenberg's *Prince Metternich in Love and War*. Two eminent figures of the age of Louis XIV were admirably discussed in J. Lewis May's *Fénelon*, and Sir Reginald Blomfield's *Vauban*, in which the knowledge of a great architect helped to illuminate the work of a great military engineer, who was also a noble and modest character.

Two of their English contemporaries biographized were Sir John Vanbrugh, by Laurence Whistler, who showed a versatile understanding of that versatile man, and Samuel Pepys, the third volume of whose *Life*, by Arthur Bryant, bore out, in point of narrative power, legitimate advocacy, and original research, the promise of its predecessors. *Further Letters of Queen Victoria* (to the House of Brandenburg-Prussia), edited by Hector Bolitho, was an interesting supplement to our knowledge of its period; so also was the fourth volume of *Lord Esher's Journals and Letters*, whose many-talented writer preferred to be a universal confidant and adviser behind the scenes rather than to parade, even in the largest parts and the grandest array, before the footlights.

Two studies of former social life, both excellent in their kind, were *The Three Ladies Waldegrave* (illustrated by some excellent eighteenth-century portraits) by Violet Biddulph, and *The Ladies of Alderley* by Nancy Mitford, whose introduction, deft to say the least, was perhaps even better than the main body of the book, which erred on the side of copiousness. The lives described in those elegant pages make a strange contrast to that once again, and very well, depicted in *Madcap's Progress* by R. Darwall. This was the life of John Mytton, that incredibly brave and enduring rake and wastrel, who ran through a vast fortune, thought nothing of riding fifty miles each way to a meet after a heavy night, astonished dinner-parties by riding into their midst, steeple-chased with tandems and, not surprisingly, died young and in misery. One more contrast from the earlier nineteenth century, that various epoch, was effected by Alice Brunel Nobel's *The Brunels, Father and Son*, in which justice was done to a remarkable dynasty.

Literary biographies were not numerous. Miss ffrench's *Ouida* has already been mentioned. It was a brief, but able and timely, book. "Timely", because Ouida, in so far as she has not been forgotten, has become, quite wrongly, a mere figure of fun, to whom the fatuities of lesser novelists are often ascribed. Miss ffrench convincingly sets her real powers over against her absurdities and vanities, and points out the power especially of her literary criticism—she was, for instance, the first English critic to

detect and analyse with prophetic acumen the genius of the young d'Annunzio

A strange eccentric politician, traveller, and poet, who drank life to the dregs in many ways, found an ideal biographer in Edith Finch. This was Wilfrid Blunt, squire of Crabbet, author of *Esther*, breeder of Arabs, agitator in Ireland and Egypt, and friends at home with the most brilliant members of the party which he most vilified, from Curzon to George Wyndham. A more modern figure, who was killed in the War, was the subject of Michael Roberts' *T. E. Hulme*. Hulme, who wrote little save some philosophical and metrical fragments, so impressed his contemporaries by the width of his knowledge and the brilliance of his Johnsonian-cum-Coleridgian-cum-Rabelaisian talk, that he has become a legend to his juniors; and it is a tribute to the force of his mind and personality that his life should have at last been written by a devout, though not undiscriminating, student who never set eyes on him. A still more puzzling, though scarcely comparable, character was *Janus Weathercock*, whose life was written by Jonathan Curling, very entertainingly. This person, one of the strangest in the annals of English literature, was Thomas Griffith Wainwright, grandson of the respectable founder of the *Monthly Review*. After being an officer in the Guards, he took to essays and art criticism, being an acquaintance of Charles Lamb. This being insufficiently lucrative, he became first a forger, then a wholesale poisoner for insurance money, then a transported convict, then a Tasmanian portrait-painter.

A musical biography worth recording was Martin Cooper's *Bizet*. At this point it may be suitable to mention Percy A. Scholes's *Oxford Companion to Music*, an amazing reference book which, in spite of its vast compendiousness, is so readable that it deserves to be classed as literature rather than with Lamb's *Biblia a-biblia*.

In the more autobiographical kind a full, exciting, and beautiful book was Walter Starkie's *The Waveless Plain*, in which the author of *Raggle Taggle*, who drinks in experience at every pore, mixes and fiddles with all sorts and conditions of men, recovered pictures of Italy in war and peace, and not only of the Lombardy to which his title refers. *The Old Century and Seven More Years* by Siegfried Sassoon continued (backwards) the adventures of *Sherston*, and was full of poignant glimpses of a vanished childhood and boyhood. *Without Knowing Mr. Walkley* was the pathetic title of a slight but delicate volume of memoirs by Edith Olivier; *Where Fancy Beckons* was a ripe and charming retrospect by H. A. Vachell; the playwright John van Druten pleasantly achieved the difficult task of a young man's autobiography in *The Way to the Present*, and Philip Jordan's *There is no Return* was notable for the strength of the writing and the obstinate clarity of its outlook. James Agate's *Ego III*, was one more draught from the exuberant fountain of an acute observer who frequents many worlds and enjoys life to the full.

Among travel-books and their kind it is tempting to put first (new discovery of an old thing though it be) one more volume of the diaries of Lord Torrington, kept in the late eighteenth century. Honest John Byng, with his horse and his water-colour box, his insatiate passion for wandering over England, his interest in everything from hotel-bills to Gothic ruins, his love of the rural past and loathing of industrialism, has crept into the position of an English classic. F. S. Smythe's *The Valley of Flowers*, about a Himalayan paradise, was one of those tantalizing books which make one "wish one were there". Philip Gosse's *St. Helena*, picturesque and quietly humorous, contained a timely plea for a neglected colony of great historical and æsthetic interest; Edward Shanks's *My England*, though slight, was written as a poet should write, and Mr. Sacheverell Sitwell was agreeably exotic on Rumania.

The appearance of *In Search of the Gyr Falcon* by "Ernest Lewis" was a sad reminder of the loss of one who was a gallant rider to hounds (after disablements which would have retired anyone else), a fine naturalist, a born traveller and observer, whose early death, after a full-blooded career, probably robbed us of many fine books. Finally, Mr. Louis McNeice's *Zoo*, gay and easy to read, might as well be described as a travel-book as anything else: when he is not travelling in the Zoo he travels wherever fancy takes him.

Miscellaneous works deserving special notice included *A History of Welbeck Abbey and its Owners* by A. S. Turberville (an excellent supplement to the Duke of Portland's own captivating books), *The Importance of Living* by Lin Yutang, and a strange, penetrating, amusing, sad book about Oxford, *The Oxford University Chest*, by John Betjeman. Of pure literary criticism there was little, but Dame Ethel Smyth plunged into the contemporary arena vigorously in her study of Maurice Baring.

In poetry, as has been remarked, very little attracted attention. But there should be mentioned Walter de la Mare's *Memory and other Poems*, *Solitude* by V. Sackville-West, *Verses* by Elizabeth Daryush, *Overtures to Death* by C. Day-Lewis, and *Penthesperon* by Christopher Hassall, an extremely promising and versatile book.

The casual essay, so characteristic an English institution since Bacon and Cowley, Addison, Steele and Johnson, Lamb and Hazlitt, was lamentably absent. Twenty years ago any season might see the appearance of delightful collections by Augustine Birrell, Maurice Hewlett, Max Beerbohm, H. Belloc, G. K. Chesterton, Maurice Baring, Robert Lynd, and E. V. Lucas. "E. V." died during the year, leaving a few unpublished papers and a little volume, *A Hundred Years of Trent Bridge*, suitable last legacy from a kindly Englishman who was a cricket-lover all his life and, in his youth, no mean player. And in Mr. Belloc's *Return to the Baltic* there was enough of the old independent essayist to enchant his old readers.

There was the usual tremendous output of novels, mostly very perishable commodities. There is no inclination as yet to place any of their juniors on the pedestals left vacant by Conrad and George Moore, Arnold Bennett and Galsworthy. H. G. Wells was lively as ever in *Dolores*, and Sir Hugh Walpole exhilarating in *The Joyful Delaneys*. *Brighton Rock*, by Graham Greene, was a caustic exposure of gangsterdom in Brighton, and A. G. Macdonnell, in *The Autobiography of a Cad*, exhibited all his customary wit, humour, and brilliance of style, though the satire was rather exaggerated and the bitterness seemed unnatural to so high-spirited an author. *Rebecca* by Daphne du Maurier and *O Absalom* by Howard Spring were successes which deserve their success. But possibly the two most notable novels of the year were *This Was a Man* by D. Pilgrim (an extremely powerful and scholarly study of Napoleon in the Walewska period) and R. C. Hutchinson's *Testament*, an impressive picture of the last struggles of the old Russian Army and the years of revolution which followed. To these may be added two others, one the work of a veteran craftsman, one of a novice: A. E. W. Mason in *Königsmark* excelled himself as an historical novelist; while David Hussey's *No Sting, No Honey*, a mixture of Rider Haggard romance and rollicking wit at the expense of extreme feminism, will be read many times by those capable of enjoying it once.

Memorable new editions of standard works were few. The trend of the times is against them and the expense of production also, apart from which we cannot go on re-editing people for ever. But two at least must be mentioned: *The Greville Memoirs* 1814–1860 was an unexpurgated edition (with the "new" passages by no means startling) launched under the editorship of Roger Fulford, who "took over" from the late Lytton Strachey—whose first familiarity with the complete MS. dated from his preparations for *Queen Victoria*; and Mr. Edward McCurdy produced a magnificent and presumably final, edition of Leonardo da Vinci's *Notebooks*. (J. C. Sg.)

ENTERIC FEVER: *see* INFECTIOUS DISEASES, ACUTE.

ENTOMOLOGY. The notable event of 1938 in entomology was the Seventh International Congress of Entomology held in Berlin, from Aug. 15–20. Attending the congress were 351 delegates from the various countries of the world. The largest delegations came from the British Isles, France, Holland, and the United States. Over 1,000 individuals actively interested in entomology registered at the congress.

The papers read before the various sections of the congress were bewildering in the variety of subjects discussed: they dealt with all aspects of entomology, through nomenclature, bibliography, morphology, physiology, embryology, genetics, and ecology to all phases of applied entomology. The last occupied a large proportion of the time and interest of the congress, since the intimate relation of insects to the welfare of mankind is becoming more clearly and more widely recognized.

Insect Palæontology. Research in all phases of entomology has proceeded with great zeal and energy, despite the world-wide social and economic disturbances. Perhaps the most impressive phase in which advance in knowledge of the science has been made is in insect palæontology. Dr. A. D. Imms in a recent survey points out that the fossils found in the rocks of the Permian and Triassic beds "have revealed so remarkable an insect fauna that our whole outlook has undergone marked changes". The strata of rocks from which specimens revealing this new knowledge have been taken are situated in Queensland and New South Wales, Australia, in North Russia, and in the State of Kansas in the United States. The rocks in Kansas have furnished, perhaps, the most perfect fossil insects, which have contributed so largely to the recent advance in knowledge of the evolution and development of the orders of the *Insecta*. Imms points out the very interesting fact, however, that "We are still faced with want of direct evidence from fossils with regard to the two most important problems of insect phylogeny, *viz.* the origin of insects as a class, and the origin of wings". Persistent search for further fossil remains may yet reveal the answer to these absorbing questions—Through what primitive forms did insects develop, and how did wings evolve?

Hormones. In another direction, comparatively recent investigations have shown that insects are endowed with those remarkable gland secretions known as hormones. Notable additions to the knowledge of these active agents in insects have recently been made. A series of experiments, recently reported, seem to prove the presence of a hormone in the body of the ubiquitous fruitfly *Drosophila melanogaster*, that has the power of changing the colour of that insect's eyes. The investigators demonstrated that tiny injections of a clear yellow fluid, derived by treatment of finely ground pupæ of the wild type of fly into certain colour-type larvæ, produced adult flies with eyes modified from nearly colourless and pale pink towards brown. The hormone appears to be very active, for the authors estimate that "1 gm. of the material would be sufficient to modify the eye colour of 4,200,000 flies".

H. E. Tyndale]

A CLUSTER OF PHROMNIA · INSECTS FOUND IN ASSAM, WHICH, IN MASS, RESEMBLE WHITE BLOSSOM AND SO ESCAPE THEIR ENEMIES

Locusts and Grasshoppers. Another important entomological meeting of the year was the International Locust Conference, held in August in Brussels. Similar conferences have been held in Rome, 1931; Paris, 1932; London, 1934; and Cairo, 1936. These conferences, attended by delegates from the various countries of the world, are notable because they attest the widespread distribution of locusts and the seriousness of their devastations.

One of the questions perennially before the conferences is the extent to which activities in the practice of agriculture and the grazing of stock affect the distribution and mass appearance of locusts and grasshoppers. One school of thought holds that the insects are dangerous only in those countries with a low level of agriculture, and that they become less injurious as such regions become more highly developed. The contrary view maintains that certain species of locusts and grasshoppers have increased with man's activities, and that therefore the general development of a country holds out little hope of lessening the danger from these insects. Probably there are not adequate data extending over a sufficiently long period of time to answer the question with any degree of finality.

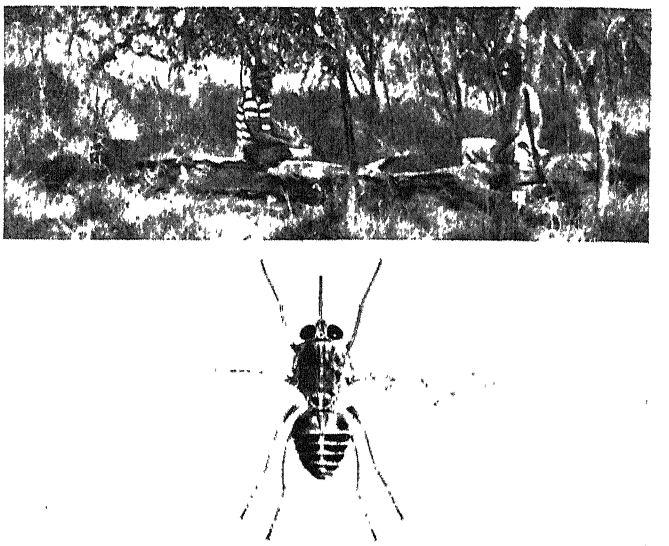
From South Africa Dr. J. C. Faure reports that during the summer season of 1937–38 the brown locust, *Locustana pardalina*, infested an area in central Cape Province of 20,000 sq. miles, and that about 1,800 tons of poison bait were distributed at a cost of about £52,000. During the 1938–39 summer season, owing to the heavy deposition of eggs in the previous year, about 60,000 sq. miles became

infested, and severe outbreaks were expected after the first rains.

The red locust, *Nomadacris septemfasciata*, following severe outbreaks in Natal and north-eastern Cape Province in 1937, appeared in much lesser numbers in 1938, and these swarms were confined to southern Natal and north-eastern Cape Province.

In the United States, the year 1938 was probably the most noteworthy of recent years for severe injury by grasshoppers. Nearly all the States between the Mississippi river and the Pacific ocean, together with Wisconsin and upper Michigan, were visited with light to severe infestations of these destructive insects. The most severe and widespread injuries occurred to small grains in parts of North Dakota and South Dakota, and to forage crops and range grasses in other States. The extensive flights of the lesser migratory locust, *Melanoplus mexicanus*, from its original breeding grounds, especially into eastern Montana, were noteworthy among the erratic activities of this species. In the corn-growing regions with its greater diversity of crops, the additional species, *M. differentialis*, *M. bivittatus*, and *M. femur-rubrum*, were present and seriously injurious, while *Dissosteira longipennis* caused severe injury in portions of Colorado, New Mexico, and Texas. The provinces of Manitoba, Saskatchewan, and, to a lesser extent, Alberta, in Canada, suffered extensively from incursions of these insects.

In Australia, there were outbreaks in New South Wales, portions of Queensland, of Victoria, and of South Australia, of the "black-tipped" locust, *Chortoicetes terminifera*; and of the "yellow plague grasshoppers", *Austroicetes cruciata*, in South Australia and in portions of Western Australia. The black-tipped locust develops in migrating swarms and, in favourable seasons, may have three generations. The yellow-plague grasshopper has but one generation and the swarms do not move far from the breeding grounds.



Noteworthy Insect Pests of the Year. The Colorado potato beetle, *Leptinotarsa decemlineata*, probably originated on the high plateau of southern Mexico. In 1859 it was found feeding on potato plants in Nebraska. By 1864 it had crossed the Mississippi river and ten years later it had reached the Atlantic seaboard. In 1887 the beetle was discovered at Mulheim, Germany. This invasion of the beetle was exterminated, but it appeared again in Germany, at Hanover, in 1914. In 1922 the insect was discovered in France, near Bordeaux. Since that time the beetle has spread over a large area in that country and threatens to overrun Germany. In the year 1938 it constituted one of the major entomological problems in France. Strenuous measures are being taken to check the spread of the insect and to control its ravages where it has become established.

The advent and spread of the beetle in the United States caused much fear and apprehension. To-day one rarely hears a grower complain of its injuries. Probably the French people will eventually find a similarly favourable outcome of the invasion.

Another serious problem at the present time in France is the sudden increase and severe injury caused by the Mediterranean fruitfly, *Ceratitis capitata*, the fly so greatly feared by the citrus growers of the United States.

Recent observations also disclose the very destructive activities of the fly in the Jordan valley in Palestine, where it attacks oranges, grapefruit, figs, and grapes.

In Australia, the sheep blowflies, *Lucilia cuprina*, *Calliphora augur*, *et al.*, constitute the chief entomological problem in that great country, with its dominant and extensive sheep industry. It is estimated that the flies cause an annual loss to Australian sheep growers of £4,000,000. Briefly, the flies lay their eggs on the wool of the sheep, where the maggots mat and destroy the wool and also burrow into the flesh of the animal, causing the disease known as "strike". The flies increase rapidly, and under favourable conditions are present in great numbers, often causing the deaths of many sheep. Extensive investigations of the lives, habits, and food preferences of the flies are being carried on, with the hope of finding some method whereby their ravages may be prevented. The blowfly problem is also a serious one in England, but there the species *Lucilia sericata* is the chief fly concerned.

Imperial Institute of Entomology]

TSETSE-FLY, *GLOSSINA MORISTANS* AND (ABOVE) A TYPICAL BREEDING-GROUND UNDER A LONG-FALLEN TRUNK OF *BURKEA AFRICANA*

The Tsetse-fly Problem. Tsetse flies, *Glossina palpalis*, *Glossina morsitans*, *et al.*, are inhabitants of tropical and subtropical Africa, and are the vectors of the causative organisms (*trypanosomes*) of the two types of sleeping sickness of man, and of the disease of cattle known as Nagana. The tsetse-fly situation is recognized as one of the chief biological problems of the British Empire. Moreover, the problem has assumed a new and unexpected significance in view of the suggested colonization of Tanganyika with Jewish refugees, for two-thirds of the total area of that colony is infested with the flies.

The British Colonial Advisory Committee, however, according to *The Times*, had already recognized the seriousness of the problem and had, earlier in the year, recommended a grant of some £200,000 to be used by the Tsetse Research Department in Tanganyika, in an extended investigation of the flies. The problem is exceedingly complex and far-reaching, because of the intimate association of the biology and habits of the flies with the wild animals, the various types of vegetation, the streams, and the forest areas of the region.

Practical Significance of Flight of Insects. The autumn of 1938 witnessed again a heavy northern flight of the cotton-leaf moth, *Alabama argillacea*. Immaculate moths, without the ruffling of a wing or scale, flew hundreds of miles from the Southern cotton fields of the United States, many of them going on beyond the Canadian border.

The pink cotton bollworm in 1938 extended its northern range in Texas (U.S.A.) to an alarming extent. The tiny moths of this insect have been found drifting on the wind at altitudes of hundreds of feet.

The European (Dutch) elm disease in the United States has "markedly" extended its affected area during the past season, because of the wider migrations of its principal vector, *Scolytus multistriatus*. The evidence is fairly clear that this small barkbeetle drifts with the wind. Heavier and larger barkbeetles have been taken on the roof of a high building, in the middle of a large city, at an altitude of at least 125 ft. above the pavement.

The wind-drifting of insects is significant from its practical bearing on measures of quarantine, instituted from time to time by various States and countries. It indicates the almost insuperable difficulty of preventing an insect from extending its territory and gradually infesting larger areas. Probably some modifications of previous regulations governing insect quarantines would ease the interchange of products, and accomplish as much as have the more rigid measures instituted in some cases in the past.

The Mosquito. The last report of the Public Health Commission of India contains the amazing statement that malaria caused the death of 1,632,000 persons in India during the comparatively short period covered by the report. The full significance of these death statistics is not fully realized until it is understood that for every death from malaria there are probably a dozen individuals suffering the pains and despondency of chills and fevers, which unfit them for the normal activities of life, and predispose them to the attacks of more virulent diseases.

At a meeting in October of the National Malaria Committee of the United States, the members were told that in seven of the Southern States there are at least 1,600,000 persons infected with malaria. This is probably too low an estimate, for a large proportion of the cases is not reported to the health authorities.

It is no wonder that malaria is considered a "stupendous" problem, for which the mosquito is responsible and against which a war of extermination should be waged with all of the vigour and knowledge the world possesses.

After the Army surgeon, Walter Reed, and his associates completed their epochal experiments in Cuba in 1900 and had demonstrated that the tiny mosquito, *Aëdes* (*Stegomyia*) *ægypti*, was definitely responsible for yellow fever infection in human beings, the disease was apparently exterminated in subsequent years from the Western Hemisphere. Then, suddenly, after freedom for 20 years, it broke out in epidemic form in the city of Rio de Janeiro, Brazil. Immediate investigation established the disconcerting fact that the fever existed in small villages in rural districts far from contact with centres of population. Those individuals who worked along the borders of forests were the chief ones attacked. Here, then, was yellow fever in the jungle where no Stegomyia existed. Intensive research gave evidence that other species of mosquitoes inhabiting the jungles must carry the infective virus of the fever. Now, in 1938, two species of mosquitoes, *Aëdes leucocelænus* and *Hæmagogus capricorni*, have been incriminated "as natural vectors of yellow fever". Other species are under grave suspicion of being involved. This discovery brings into startling relief the great danger to the United States from the introduction of the disease from the infected regions of South America, through the rapid and frequent international trips of passenger 'planes. Moreover, through the medium of the aeroplane, Europe and India, which heretofore have been unconcerned, are now in grave danger from the introduction of the disease from the endemic fever regions of Africa; for, as Dr. V. G. Heiser says, "A mosquito loves to ride in an aeroplane as much as a dog does in an automobile. Open the door a crack to either, and he or she will hop in". (*See* also EPIDEMIOLOGY.)

EPIDEMIOLOGY. The outbreak and continuance of hostilities in some parts of the world, and social disturbances in others, have aroused fear of the spread of epidemic disease. As far back as Dec. 1936, the League of Nations, at the request of the Spanish government, sent a health mission to Republican Spain to study this problem and advise the government. The commission was impressed with the danger of the spread of typhus fever. Happily, no epidemic of this disease appears to have occurred in Spain, but the state of affairs in Morocco, so closely associated with the Iberian Peninsula, justified their alarm. Typhus, which is endemic in the remoter districts of the Atlas, has ravaged the province of Marakesh in grave epidemic form since Oct. 1937. Official records appear to be incomplete, but there is reason to believe that deaths alone may have reached over 4,000 and the number of cases about 30,000. Protection of individuals with a live virus-vaccine is said to have been efficacious in some areas. As to enteric fever, another disease fostered by war and disorder, statements issued by the Barcelona Government Sanitary Administration indicate that there has been little increase of the disease in the area occupied by the Republican army.

Epidemics in China. The position in the East was less reassuring. In parts of China outbreaks of cholera, malaria, and smallpox have followed warfare and the mass movements of refugees. Precise data as to cholera and malaria are lacking, but newspaper reports have indicated that large numbers of Japanese troops operating on the Yangtse, as well as labourers working in camps around Nanchang, have been disabled by one or other of these diseases. More recent official reports from Japan record the occurrence in Fakuyama, a Japanese city, of cases of cholera possibly having their origin in Shanghai. The flow of refugees to Hong Kong at the end of 1937 caused a definite increase of smallpox, of which the average winter incidence is about 200 cases. In the first quarter of 1938 the reported cases numbered about 2,000 and the deaths over 1,500, the apparently high fatality suggesting that the knowledge of cases was imperfect. In the last quarter of the year an epidemic of smallpox broke out in Shanghai, said to be the worst since 1874, involving about 1,100 cases up to Dec. 24. In the autumn of 1938 plague broke out in Northern China in a region between Hainking and Taonan. Within less than four weeks in October 250 deaths, and by Nov. 11, 534 deaths, had been reported. The recorded fatality rate of 99 per cent indicates that this is a recurrence of the pneumonic form of plague which arose among tarbagan hunters in 1910 and again became epidemic in 1923 and 1928. It should probably not be attributed to war conditions.

EPIDEMIOLOGY

ENGLAND AND WALES:

Number of Notifications of Certain Infectious Diseases in 1938 * compared with 1937

	Cerebro-Spinal Fever	Diphtheria	Dysentery	Encephalitis Lethargica (Acute)	Enteric Fever (including Paratyphoid)	Pneumonia (Acute Primary and Influenzal)	Poliomyelitis (Acute)	Polioencephalitis (Acute)	Scarlatina	Smallpox
1938	1,303	65,720	4,194	198	1,347	45,115	1,485	95	99,413	17
1937	1,140	61,339	4,167	217	2,151	55,893	708	96	95,737	4

* Provisional figures, compiled from the Registrar-General's Weekly Returns for 52 weeks, commencing Jan. 2 (corrected for each week).

Central Europe. More recently it has been suggested that poverty and overcrowding among the refugee Jews of Central and Eastern Europe may engender epidemic disease not only among them but also among their neighbours and the people of countries to which they may be evacuated. No such occurrence has so far been recorded.

Infection carried by Aircraft. In compliance with the International Sanitary Convention of 1933, the Minister of Health of England and Wales has made Regulations [1] for preventing the transmission of infectious disease by aircraft. They provide for the establishment of "sanitary aerodromes" at customs aerodromes used by foreign-going aircraft and aim especially at the control of the five "convention" diseases, *viz.* plague, cholera, yellow fever, typhus, and smallpox. The procedure laid down in the Port Sanitary Regulations, 1933, is followed, with modifications dependent on the greater rapidity of air transport. The Ministry of the Interior of the government of the Reich has also established fifteen sanitary aerodromes staffed and equipped to take similar precautions. The increased danger of the spread of yellow fever by aircraft in tropical zones has been the subject of consideration by the Permanent Committee of the Office International d'Hygiène Publique, special attention being given to the propriety of passengers being required to carry declarations of origin furnished by air travel agencies, to the elimination of mosquito harbourage in aircraft, to methods of destroying mosquitoes in aircraft and to the sending of sanitary messages by wireless from one aerodrome to another. The Convention of 1933 does not particularize on these matters.

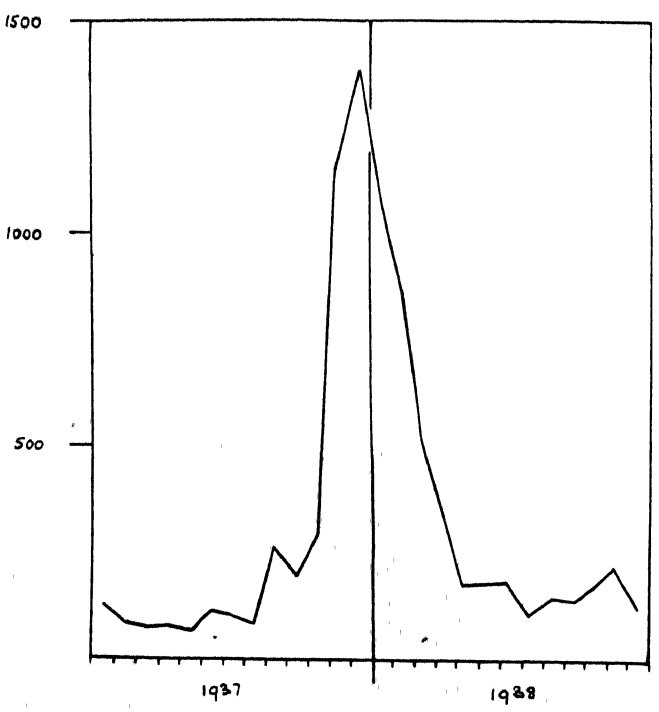

CHART OF DYSENTERY INCIDENCE FOR 1937 AND 1938

Infectious Diseases in England and Wales. The incidence of certain notifiable diseases is shown in the accompanying table, the figures for 1937 being given for comparison. Further reference may be made to those diseases which reveal significant tendencies.

Diphtheria. The increase here lends emphasis to the comments made in *Ency. Brit. Book of the Year*, 1938, on the failure of Great Britain to follow the lead of the United States and Canada, where active immunization has succeeded in reducing the volume of the disease in many areas to insignificant proportions.

Dysentery. The true behaviour of this disease is masked by the tabulated annual figures, and is therefore exhibited in graphic form. The chart reveals that an epidemic of an unusual character occurred at the end of 1937 and the beginning of 1938. That the increase of recorded cases in the autumn and winter of 1937 was not merely due to greater use of diagnostic methods, including bacteriological examinations, is obvious from the absence of any comparable rise at the end of 1938. The micro-organism associated with most of the cases submitted to laboratory tests was *Bacterium dysenteriæ* (Sonne). No satisfactory explanation of this most unusual occurrence has so far been given.

Enteric Fever. The reduction is mainly due to the absence of any large epidemics such as that which affected Croydon in 1937.

Pneumonia. The lower incidence reflects the absence of a major epidemic of influenza.

Poliomyelitis. This disease was twice as prevalent as in 1937, when the incidence was higher than it had been for ten years. The wave began in the third week of July and rapidly reached a maximum in the second week of August. After a slight recession a second peak was reached in the third week of October, followed by a steady and fairly quick decline. The disease was widespread throughout the country, but it assumed minor epidemic form in parts of the counties of Essex and Glamorgan.

Influence of Diet on Epidemics. In view of the paucity of precise knowledge as to the effect of food deprivation on susceptibility to infection, reference may be made to important work done in the London School of Hygiene.[2] The addition of dried milk to the diet of mice caused a significantly lower mortality from mouse-typhoid as compared with that affecting a group of mice identically fed in other respects and kept under identical conditions.

(*See* also ACUTE INFECTIOUS DISEASES.)

United States. The control of pneumonia appears to be a probability as a result of active immunization. Felton produced active immunity in mice and humans with an antigen prepared from the polysaccharide of the pneumococcus. This antigen produced serum antibodies in both mice and humans. Its practical application has been demonstrated in field tests on Civilian Conservation Corps men in camps in New England and on the west coast.

Immunization against Diphtheria. The general opinion seems to be that, dose for dose, alum-precipitated toxoid is superior to plain toxoid. The Saginaw county, Mich., experiment showed that two doses of precipitated toxoid, given one month apart, give a higher amount of antitoxin content in the blood than do three doses of plain toxoid used one month apart There has also been some work on the combined use of antitoxin and toxoid in susceptible contacts to cases and carriers of diphtheria. Dr. Alberto P. Leon, chief of the division of epidemiology, Department of Public Health, Mexico, obtained considerable success with the simultaneous immunization, both active and passive, with Sordelli's toxoid and antitoxin, as used in susceptible contacts to cases and carriers of diphtheria.

The Chicago syphilis control programme, an attempt to control syphilis in a large urban population, with the combined efforts of Federal, State, and local agencies, has met with considerable success On May 24, Congress approved an act for further appropriations of the United States to continue the fight on venereal diseases.

ESPIONAGE. With Governments publishing, collecting, and exchanging information of every kind through known agencies, the actual number of spies in the melodramatic sense of the word is stated to be small—say 3,000. In Great Britain, three such spies were sentenced on March 14 to six, four, and three years' imprisonment respectively. In the United States eighteen spies, said to have been employed by Germany, were indicted in June, of whom all save four escaped the jurisdiction of the courts. In view of Japanese espionage at Panama and along the Pacific Coast, facilities for photographing strategic points are restricted. France saw (June) the reintroduction of the death penalty for espionage in peace-time, the previous maximum sentence having been twenty years' imprisonment. The preamble to the decree pointed out that Germany, Italy, Poland, Czechoslovakia, and Rumania all now punished spying by death. The first sentence under the new law has already been passed.

ESTONIA. In view of Central European affairs, the state of emergency (virtually martial law) was extended (September) for another year. With Latvia, Estonia used persuasion (March) upon Lithuania (*q.v.*) to reconcile her enmity with Poland. In October a new measure defined Estonia's neutrality. At home, on New Year's night, festivities marked the restoration of parliamentary government, suspended since 1934. The new Constitution provides for a President (elected for six years) and two Chambers, the lower of eighty members, elected directly on "the English system" by adults over 22; the upper, of forty, indirectly elected. M. Konstantin Päts, pre-eminently identified with Estonia's independence, was formally confirmed in the Presidentship at the May elections. A new cabinet was formed, under M. Karl Eenpalu. (H. Fw.)

Area and Population:
Area 18,371 sq. miles.

Estonian Travel Bureau]
THE OLD CASTLE AT TALLINN, CAPITAL OF ESTONIA

Population (Jan. 1, 1938) 1,131,125.

Schools: elementary, 1,224; secondary, 120; universities, 2.

ETCHING. A survey of etching during 1938 reveals a continued and healthy development along both geographical and artistic lines, with principal activity centred in England and the United States. In France less important work is being done than during the early years of the century, book illustration, particularly in the medium of line-engraving, seeming to claim the attention of a considerable proportion of living engravers, yet Adam, Berg, Boullaire, Cami, Frélaut, Goërg, Gromaire, Laurencin, Léopold-Lévy,

Maillol, Orovida, Rouvière, Segonzac, and Villon are carrying on the great French tradition of graphic art. The newly organized National Committee of Engraving, with P. A. Lemoisne, chief of the Bureau of Prints of the Bibliothèque Nationale, at its head, is functioning in the interests of prints, both nationally and internationally.

In Italy the 21st Biennial Exposition at Venice attracted graphic art from eighteen countries, while an interesting exhibition of prints in the metal-plate media, assembled by the Society of American Etchers, was shown at the Italian Centre for American Studies in Rome. Conspicuous among Italian etchers, all of them working in the traditional style, have been Barriviera, Bellotti, Boglione, Mainini, Mauroner, Petrucci, Pietra, and Zarini. Little has come from war-torn Spain during the past year, the work of the surrealist Salvador Dali being hardly typical of that country's art.

The traditional spirit of German etching has been carried on by the work of Jensen, Jettmar, Luiko, Mayer, Schultheiss, Sintenis, Winkler, and Hans Theo Richter, the last named of whom won the Logan Art Institute Prize at the fifth International Exhibition of Etching and Engraving at the Art Institute of Chicago, U.S.A.

Polish print makers of today have devoted themselves largely to the block-print, but Stankiewicz and Widymska have both produced etchings in 1938. In Hungary, however, the art flourishes and interesting work is being done by Poharnok, Szönyi, Weil, and Zàdor, while Nandor Varga, of Budapest, has dry-pointed some striking and forceful portraits, and Julius Komjáti continues to etch his lovely plates of both portrait and landscape subjects. The best known of the considerable group of Czechoslovak etchers is J. C. Vondrous, who received his schooling in the United States and was for many years a resident there; while in Bulgaria Nenov and Staikov have both worked in dry-point. A comprehensive exhibition of contemporary American prints, sent to Europe by the Society of American Etchers, is now in Budapest.

In the Scandinavian countries, Swedish etchers continue to predominate, with work by such well-known practitioners as Asberg, Johanson, Lindborg, Sparre, and Veslen; while Finland has been well represented by Tandefelt and Segerstråle. During the summer 425 prints by members of the Northern Graphic Union were shown at the Victoria and Albert Museum, London, offering an opportunity for visitors to become familiar with etching as practised to-day in Sweden, Denmark, Finland, and Norway. In return, an exhibition of British prints will be shown in these countries during the winter of 1939–40. Meanwhile the exhibition of Swedish prints which was sent to the United States in return for a similar exhibition sent to Sweden in 1937, and which opened in New York in the autumn of that year in conjunction with the 22nd Annual Exhibition of the Society of American Etchers, is still travelling through the United States under the auspices of that Society.

British etching has been less affected by the so-called "modern" influence than has that of any other country, probably because of the firm roots of conservative art there and the existence of so many schools where etching, in the traditional spirit, is taught. A large section of the annual exhibition of the Royal Academy is devoted to prints and drawings, and the Royal Society of Painter-Etchers and Engravers, the principal print organization of England, holds a comprehensive exhibition of the work of its members every year in London. Sir Frank Short, R.A., has just retired from a long tenure of office as president, having succeeded Sir Francis Seymour Haden, who founded the Society, in this position, and Mr. Malcolm Osborne, R.A., has been elected to fill his place. The last named won the Frank G. Logan Prize at the 28th Annual Exhibition of the Chicago Society of Etchers with his dry-point portrait of C. J. Vint. Among the etchers who have published work during the past year are Bell, Bone (a magnificent dry-point entitled "Railway Sheds, Marseilles"), Briscoe, Buckton, Cain, Copley, Cowern, Currey, Davis, Dent, Dicksee, Drury, Fairclough, Fairley, Fisher, Flint, Freeth, Gross, Hardie, Holloway, Hudson, Jebb, Josset, Lack, Nicolson, Osborne, Patrick, Pearsall, Short, Smith, Stanley, Ian Strang, Taylor, Ward, Warlow, Williamson, Wilson, and Witherop. British etching has sustained a great loss within the year in the death of Frederick L. M. Griggs, R.A., one of the most distinguished practitioners of the art of recent times.

Barry and Taylor continue to be conspicuous in Canadian etching, and the Society of Canadian Painter-Etchers and Engravers is doing constructive work.

In spite of the great number of print makers working on stone and wood, the contemporary school of American etching continues to flourish and to increase in the number of artists included in it, and it may safely be said that, with Great Britain, it shares a greater activity than is taking place in any other country to-day. The three leading print societies—the Society of American Etchers, the Chicago Society of Etchers, and the Print Makers' Society of California—together with numerous other similar organizations all over the country, hold annual and travelling exhibitions; most of the important general exhibitions of contemporary art have print sections; print galleries are to be found in nearly all the larger cities; museums and libraries feature print activities, and the fact that laymen are becoming increasingly interested in prints is evinced by the constant formation of societies devoted to their study and of collections, both public and private. During the summer of 1939 there will be held, at the New York World's Fair, an exhibition of contemporary American prints, the most widely selected and representative of all phases of graphic art in the United States that has ever been assembled. During the past year twenty-one American print makers participated in the Biennial Exposition at Venice. Under Government administration an extensive programme has been carried out in the field of prints, the work so produced being assigned to various public institutions, such as museums, libraries, and schools.

Although the famous etcher of wildfowl, Frank W. Benson, is no longer active, Bacon, Isabel Bishop, Richard Bishop, Cadmus, Chamberlain, Costigan, Eby, Handforth, Heintzelman, Higgins, Hoffman, Landeck, Martin Lewis, Loggie, Marsh, Kenneth and Helen Miller, Osk, Reynard, Rosenberg, Rothe, Schaldach, Sloan, Sterner, Washburn, Woiceske, Woodbury, George Wright, Stephens Wright, and Mahonri Young, and the American Herman Webster living in Paris, have all done significant work during the year 1938. In addition, John W. Winkler has published some new and beautiful plates. The internationally known Donald Shaw MacLaughlan has died. (J. T. AR.)

EUROPE. The year 1938 was the most dramatic and most momentous in European history since 1918. It saw the first substantial breaches in the territorial settlement of Europe made in 1918; and there were a few days at the end of September when the outbreak of another European war seemed almost inevitable. The chief events of the year group themselves round a principal storm-centre in Central

Europe, formed by Germany, and a subsidiary storm-centre on the Mediterranean, formed by Italy.

Germany had freed herself, before the end of 1937, from all the restrictions and servitudes imposed on her by the Versailles Treaty But the Versailles frontiers remained intact. The first attack on these was made at their weakest point. The veto placed by the Treaty on the union of Austria with Germany contravened the principle of self-determination Prior to the Nazi revolution, opinion in Austria was almost unanimous in favour of such a union; and even later, a majority of Austrians would probably still have supported it. The government of Dr Schuschnigg was generally unpopular It was largely dependent on Italian support; and the growing weakness of Italy *vis-à-vis* Germany determined its fate. On Feb 12 Dr Schuschnigg for the first time visited Herr Hitler at Berchtesgaden, and as the result of the conversation, appointed two Austrian Nazis to his cabinet What happened during the next few weeks is obscure But on March 10 Dr. Schuschnigg suddenly announced a plebiscite to be taken on the following Sunday (March 13) on the future regime of Austria. This was treated by the German government as an act of defiance. On the evening of March 11 an ultimatum was sent, demanding the resignation of Dr. Schuschnigg, and German troops crossed the frontier. No resistance was offered; and within a few hours the virtual incorporation of Austria in Germany was effected. This was subsequently confirmed in a plebiscite held on April 10. Prominent supporters of Dr Schuschnigg and many Jews were arrested or maltreated. Later in the year, there were anti-Catholic riots in Vienna

The union of Austria with Germany meant that the whole western part of Czechoslovakia was surrounded on three sides by German territory; and it became clear how precarious was the position of a state which contained three and a quarter million Germans (or one-quarter of its whole population), and was bound by treaties of alliance to France and Soviet Russia. The Czechoslovak government tried to avert the coming storm by offering a new "charter of rights" to its minorities. Herr Henlein, the leader of the National Socialist Party of the German minority, rejected the offer as inadequate and put forward demands for complete autonomy, which were in turn rejected by the government. On May 20 a frontier incident caused fresh tension. German mobilization on the frontier was alleged in Czechoslovak but denied in German quarters; and it was widely believed that a German invasion of Czechoslovakia was only averted by British representations at Berlin Negotiations between the Czechoslovak government and the Sudetens (the name commonly given to the Germans of Czechoslovakia) continued throughout the summer At the end of July, Lord Runciman went to Prague with the approval of the British government to advise the Czechoslovak government on the problem.

During August the tension grew steadily greater. A partial mobilization of the German army took place under the guise of manœuvres; and in the middle of September the danger of direct intervention by Germany appeared so great that Mr. Chamberlain took the initiative of proposing a personal visit to Herr Hitler. At this meeting, which took place at Berchtesgaden on Sept. 15, Herr Hitler formulated the demand for self-determination, involving the incorporation of the Sudeten districts in Germany. Immediately afterwards, the British government received the report of Lord Runciman, who considered that no solution was possible on the basis of the retention of the

Wide World

MR. NEVILLE CHAMBERLAIN, M DALADIER, HERR HITLER AND SIGNOR MUSSOLINI AT MUNICH, SEPT 29, 1938

Sudetens in Czechoslovakia. Neither the French nor the British government was willing to risk war in order to withstand Herr Hitler's demand, and the Czechoslovak government under pressure accepted these terms. On Sept 22, Mr. Chamberlain met Herr Hitler at Bad Godesberg to discuss details. On this occasion Herr Hitler peremptorily demanded the evacuation of indisputably German areas by Oct 1, and the holding of plebiscites in further areas. The Czechoslovak government rejected these terms and completed its mobilization; and opinion in most countries regarded war as inevitable. Following a suggestion from Mr Chamberlain to Signor Mussolini, however, Herr Hitler invited the heads of the British, French, and Italian governments to meet him at Munich. The meeting took place at Munich on Sept. 30 and reached an agreement, which was accepted by Czechoslovakia. The Godesberg time-limit was slightly extended, and the task of defining the frontier between Germany and Czechoslovakia was left to an international commission meeting in Berlin.

As a sequel to these events, Czechoslovakia was compelled to set up autonomous regimes in Slovakia and Ruthenia, to cede to Poland the district of Teschen (claimed by Poland since 1919), and to restore to Hungary the predominantly Hungarian districts which Hungary had ceded to her under the treaty of Trianon. The result of all these losses was to reduce the population of Czechoslovakia from rather less than 15,000,000 to rather less than 10,000,000. President Beneš resigned; and Czechoslovakia's foreign policy was brought into line with that of Germany.

On the occasion of the Munich agreement, Mr. Chamberlain and Herr Hitler signed a declaration that future differences between their two countries should be settled by peaceful consultation. On Dec. 6 the German Foreign Minister, Herr von Ribbentrop, visited Paris, and a Franco-German declaration of a similar tenour was signed.

The economic and financial difficulties of Germany increased during the year; and neither the annexation of Austria and of the Sudeten territories, nor the prolonged and costly mobilization of the German army, was calculated to relieve them. In November, following the murder of a German diplomat in Paris, a renewed anti-Semitic campaign of great violence began in Germany, with the declared object of bringing about the removal of all Jews from Ger-

many. These measures excited horror and indignation in English-speaking countries. Criticisms made there were strongly resented in Germany, and in the latter part of the year Anglo-German relations again deteriorated. The problem of refugees was frequently discussed during the year, notably at an international conference held at Evian in July. But the scale of the problem appeared to defy any attempt to find a radical solution.

Italy remained throughout the year faithful to the "Rome-Berlin axis"; and during the Czechoslovak crisis Signor Mussolini declared publicly that war would find Italy on the German side. But the fate of Austria had been an unpleasant reminder of Germany's power and proximity, and Italy sought to strengthen her position by improving her relations with Great Britain. On April 16 an Anglo-Italian agreement was signed in Rome. Italy repeated her previous declaration undertaking to respect the *status quo* in the western Mediterranean, and added that she would seek no "privileged economic position" in Spanish territory. She also accepted the British plan for the proportional withdrawal of volunteers from both sides in Spain, and promised to withdraw all troops not previously withdrawn at the end of the civil war. In return, Great Britain undertook to recognize Italian sovereignty over Ethiopia But the whole agreement was to take effect only after "a settlement of the Spanish question". The most concrete advantage derived by Great Britain from the agreement was the cessation of Italian propaganda against Great Britain in Arab countries. Italy continued to supply military material to General Franco. But a withdrawal of 10,000 Italian troops from Spain in October was accepted by Great Britain as a sufficient contribution to a Spanish settlement to justify the coming into force of the agreement It was brought into force on Nov. 16.

The partial improvement in Anglo-Italian relations was not accompanied by any increased friendliness in Italy towards France. Friction was constant, and culminated in December in demands (voiced in the Italian Chamber, in the press, and in public demonstrations, though not officially endorsed by the Italian government) for the cession to Italy of Tunisia, Corsica, Nice, and Jibouti. Demands for Italian participation in the control of the Suez Canal and for a reduction of the canal dues was perhaps intended to be taken more seriously.

In November the Italian government published various anti-Semitic decrees; Jews who had settled in Italy since the War became liable to expulsion, and no Jew might own property in Italy in excess of a certain limit of value.

Great Britain. Mr. Eden resigned his post as Foreign Secretary in February owing to his opposition to the negotiations with Italy which led up to the Anglo-Italian Agreement. He was succeeded by Lord Halifax. After that time, and especially after the Munich settlement, the foreign policy of the government was frequently attacked by a small group of government supporters as well as by the opposition. Rearmament was the principal pre-occupation in British domestic politics. The rearmament programme of the government, and especially its organization of Air Raid Precautions, was widely criticized on the score of inadequacy. But there were few signs of any general swing of opinion in the country against the government.

France. The year 1938 was marked by a further reaction against the socialist policy of M. Blum and by the gradual dissolution of the Popular Front. In April M. Daladier became President of the Council, with M. Bonnet as Foreign Minister; and from this time relations between the government and the Left parties steadily deteriorated. The Munich Agreement, though approved by all other parties, intensified the opposition of the Communists; and the collapse of the Popular Front was completed by the financial and economic programme introduced in November by M. Reynaud, the Minister of Finance. This programme, which involved in fact, though not in theory, the abandonment of the forty-hour week, was attacked by all the Left parties as imposing an undue share of sacrifice on the worker. A general strike called for Nov. 30 was a failure; and strikes in individual industries were broken by government action.

Spain. The civil war continued with varying fortunes. In April General Franco reached the Mediterranean at a point between Barcelona and Valencia, splitting government territory in two; in December he launched the offensive that ended in the fall of Barcelona. Insurgent aircraft continually bombed government ports and foreign merchant ships lying in them. On July 5 the Non-Intervention Committee in London finally approved a revised version of the British plan of July 1937 for the proportional evacuation of foreign volunteers from both sides and the conditional grant of belligerent rights to the insurgents. In September the withdrawal of all volunteers fighting with the government forces was announced, and this had been completed by the end of the year. On the insurgent side, no substantial withdrawals were known to have taken place other than that of 10,000 Italians (*see* under Italy above).

Poland lost no time in turning Germany's successes to account. In March she seized the moment of the German occupation of Austria to demand the restoration of normal relations with Lithuania, which had been broken off since the seizure of Wilno by Poland in 1920; and Lithuania, faced with a threat of military force, complied. In the Czechoslovak crisis, Poland's ambitions were satisfied by the annexation of Teschen. But she also desired to see the cession to Hungary of the whole of Ruthenia, which would have given Poland and Hungary a common frontier. German opposition to this plan angered Poland; and Germany's evident inclination to encourage the Ukrainian movement in Ruthenia (now known as Carpatho-Ukraine) created apprehensions in both Poland and Soviet Russia, and accounted for a marked improvement in Polish-Soviet relations towards the end of the year. It was significant that strong demands for autonomy were heard at the same moment from the Ukrainian minority in Poland.

The Soviet Union played little part in European affairs during 1938. In March there was a further trial of twenty-one prominent Soviet citizens, including Bukharin, Rykov, Rakovsky, and the former head of the G.P.U., Yagoda, on the usual charges of treason and sabotage; and nineteen were executed. Extensive purges of officials and others were announced from time to time. During the Czechoslovak crisis, the Soviet government stated that it would fulfil its obligation under the Soviet-Czechoslovak Pact to come to the assistance of Czechoslovakia if France did the same.

In the small countries of **Central and South-Eastern Europe,** Germany continued her drive for political and economic supremacy, and acquired a preponderant share in the trade of all these countries, though in Greece and Turkey British influence remained powerful. Turkey received during the year substantial commercial credits from both Germany and Great Britain. (E. H. C.)

EXAMINATIONS. The fundamental questions to be asked in respect of each examination, and each part of an

examination—What, exactly, are we testing? Are we testing it satisfactorily?—often receive scant attention. The subject has been discussed in a symposium by 22 experts, in connexion with typical English examinations (*The Purposes of Examinations*, Evans Brothers, 1938).

An important series of inquiries into the working of examination systems in several countries have been made at the suggestion of the Carnegie Corporation and Foundation and the International Institute of Teachers College, Columbia University, New York, since the beginning of 1932; and the results have been, or are in course of being, published by the various "International Institute Examinations Enquiry Committees". Though financed by means of funds derived from the Carnegie Corporation, each of these committees was left entirely free to choose its own subjects and methods of inquiry. The Carnegie Foundation itself has issued two publications of wide general interest. Professor I. L. Kandel's *Examinations and their Substitutes in the United States* (1937) reveals a new attitude towards the whole system of examinations other than those intended to test professional skill, *e.g.* those for motor-drivers at one end of the scale, and for doctors or actuaries at the other. In professional examinations the duty of the examiner is to decide whether a candidate is fit, or unfit, to exercise his *métier* without risk to the public. But the tendency of educational thought in America is to regard the proper object of examinations at the primary, secondary, and early university stages in a different light; not as a means of separating the sheep from the goats, but as a means of "vocational guidance" in its widest sense. In England a battle is still being fought over the School Certificate Examinations with from sixty to seventy thousand candidates a year, which guard the entrance to the universities and the chief professions, and to many business careers. The present system has been criticized in many ways. It fails to take sufficient account of pupils whose gifts lie outside the ordinary, especially in art and technical skill. The requirement that a pupil should take again a subject in which he has passed because he has failed in other subjects is also unreasonable, if to "pass" means any permanent attainment. On the other hand, tests in some subjects are so organized that it is difficult to attach any meaning to the verdict in terms of utilizable skill. With its severities, and its leniencies, only some seventy per cent of the candidates pass the examination as a whole at any one time, while some 25 per cent of the number of possible candidates are discouraged from presenting themselves each year. The facts indicate a grave maladjustment between the system of examinations and that of secondary education.

The book by W. S. Learned and Ben D. Wood, *The Student and his Knowledge*, an account of an investigation organized by the Carnegie Foundation, shows clearly that though the examination system is far less rigid in the United States, there is also serious maladjustment, and many students have been encouraged to pursue studies for which they are unsuited.

We now come to certain questions relating to the technique of examinations of fundamental importance. There are two characteristics to be considered in connexion with the marks allotted at any examination tests: (1) their validity, *i.e.* the agreement of the measurements with the things they are supposed to measure; (2) their "consistency" (a term sometimes replaced by the ambiguous term "reliability"), which designates the degree of agreement between any two independent sets of measurements of the same thing (*see* a chapter by Professor C. Spearman, F.R.S., in *Essays on Examinations*, Macmillan, 1936). The two characteristics have to be considered in connexion both with the "new-type" examinations, in which the answer to each question is such that any examiner will award it the same mark, and the traditional essay-type, in marking which examiners frequently exhibit wide differences, and in which the same examiner marking twice at different times may exhibit a great variation in his own judgments.

As Spearman points out, a test may yield consistent results but have little validity, *i.e.* may be ill-designed for its purpose; but a test of which the consistency is low must have low validity. If the marks of a number of examiners, all regarded as qualified, are widely different, no meaning can be attached to the results.

The investigations of the English, French, Swedish, Finnish, and Norwegian Committees reveal the grave inconsistencies which may occur in marks awarded in examinations of the traditional type The English results, recorded in *An Examination of Examinations* and *The Marks of Examiners*, by Sir Philip Hartog, Dr. E. C. Rhodes, and Professor Cyril Burt (Macmillan, 1935 and 1936), show that at some of the most important of the primary, secondary, and university examinations independent judgments of the different examiners, and different boards of examiners, acting independently, may differ widely. Further, when fifteen School Certificate History scripts were re-examined by the same fourteen examiners after an interval of from twelve to nineteen months, they altered their awards of "classes" in 92 cases out of 210. Statistical and other precautions taken by examining bodies, no doubt, reduce the element of chance in some large-scale examinations, but it must remain considerable.

The new-type examinations are exempt from the more flagrant inconsistencies of the traditional type; but they are not exempt from criticisms, which can only be outlined here. It has been said that they do not test constructive power and imagination, which is true; that they merely test verbal memory, which is untrue. Many of the newer forms of tests, such as those of the American Co-operative Test Service, would be unintelligible to a person who had not thoroughly studied the subject. They have, moreover, the advantage of covering, in the same time, an immensely wider field of knowledge than the essay-type of examination. Experiments are required on both types of examination by means of new methods not involving the fate of candidates until they have proved satisfactory.

Efforts are being made to test the validity of examinations designed to test the suitability of children for higher education by the "follow-up" method, *i.e.* by comparing their success at these examinations with their later achievements either in class or at higher examinations. Reference should be made to *The Reliability of Examinations*, by Professor C. W. Valentine (University of London Press, 1932), to the extensive investigation on the subject by the Scottish Council of Educational Research, under the I.I.E.E. scheme, of which the first results were recorded in *The Prognostic Value of University Entrance Examinations* in Scotland (University of London Press, 1936), and which is still being continued, and to similar investigations carried out by the I.I.E.E. Committees in Finland and Sweden.

EXCHANGE EQUALIZATION FUNDS AND GOLD MOVEMENTS. The year 1938 roughly fell into two parts. The first, which lasted until about April, witnessed a continuance of the previous year's movements, namely, an efflux of funds from France. This came to an end with the creation of the Daladier franc early in May, and the remaining eight months of the year witnessed chiefly the monetary reaction to the prevailing state of political tension which reached its climax in the September crisis.

Gold movements, so far as they are recorded by the returns of the world's chief central banks, reveal comparatively little. Thus the Bank of England's gold holdings underwent no change at all during the whole of the year, as the following table shows. There were substantial increases in the central bank holdings of the United States, Holland, Belgium, and Switzerland. The Bank of France's gold stocks were reduced by just over Frs. 3 milliards during the year, but in November the Bank's gold stocks were written up from the basis of 43 milligrams of gold, nine-tenths fine, per franc to one of 27½ milligrams. Thus, instead of showing at the end of November gold stocks of Frs. 55 milliards, the Bank showed a gold stock of Frs. 87 milliards.

Central Bank Gold Reserves

	Nov. 1937	Nov. 1938	Change
England (£ millions)	326·4	326·4	—
United States ($ millions) (monetary gold stock)	12,774	14,312	+ 1,538
France (Frs. millions)	58,032	{55,808 / 87,264}*	— 3,124
Germany (Rm. millions)	70·3	70·8	+ 0·5
Holland (Fl. millions)	1,382	1,506†	+ 124
Belgium (Bel. millions)	3,318	3,446	+ 128
Switzerland (Frs. millions)	2,663	2,880	+ 217

* Frs. 55,808 millions at 43 milligrams, nine-tenths fine, gold per franc. Frs. 87,264 millions at 27½ milligrams, nine-tenths fine, gold per franc. The reduction in the third column is based on the valuation at 43 milligrams.

† Includes a small amount of silver.

The full extent of the year's gold movements cannot be told, for the simple reason that many countries now operate exchange funds the size and the composition of which are revealed either not at all or only at infrequent intervals. Some indication of the British position is afforded by the half-yearly statement of the position of the British exchange equalization account. This is given in the following table, which shows how the British gold stocks rose up to March 31, 1938, but fell heavily during the ensuing six months:

British Gold Holdings

(valued at 140s. per fine ounce) (£ millions)

	Sept. 30, 1937	March 31, 1938	Sept. 30, 1938
Bank of England	537·6	537·6	537·6
Exchange Equalization Account	279·3	297·8	151·8
Total	816·9	835·4	689·4

The real story of the year's monetary operations therefore rests upon the experience of the various exchange funds. During the spring the continued pressure on the franc led to a fresh drain of funds from France, so much so that in February the gold resources of the French exchange fund had to be reinforced. At the end of Nov. 1937, Frs. 3 milliards of gold had been transferred from the French exchange fund to the Bank of France. This gold had to be restored to the French exchange fund in February, and this explains the drop in the Bank of France's gold stocks on the old basis of valuation shown in the first table. The main pressure on the franc lasted until the middle of April, but was then abruptly brought to an end by M. Daladier's decision to depreciate the franc from about Frs. 160 to an upper limit of Frs. 179 to the pound sterling. The immediate consequence of this was a rush to re-convert into francs French funds which had taken refuge in London, New York, and other centres. Their French owners reaped a handsome exchange profit from this re-conversion, and the repatriation of this money enabled the French exchange fund to recover in May the equivalent of some £100 millions sterling of gold. Even during the September crisis not all this gold was lost again, while M. Reynaud's reforms of November, followed by M. Daladier's successful handling of the French labour troubles, led to a further repatriation. So far as can be told, the French exchange fund must have gained gold on balance during the year, but it is quite impossible to say how big its net gain was.

It is now time to look at the British experience, for this largely gives the key to both phases of the past year. Before describing the year as a whole, it is necessary to give a very brief description of the British exchange equalization account's technique. The function of the exchange account is to smooth out passing fluctuations in sterling, though not to undertake the impossible task of resisting a larger movement. To perform this function the account sells sterling to meet a passing demand such as is occasioned by an influx of funds into London; and sells foreign currency, for example francs and dollars, whenever there is a sudden outflow of funds from London. To do this, it obviously has to hold both gold and sterling. Theoretically it could keep its sterling on deposit at the Bank of England, but in practice if it did so, there would be a perennial stringency in the London market, for the British banking system would be deprived of all the cash in the possession of the exchange account. The exchange account therefore invests its sterling in Treasury bills. This means that when the account is replete with sterling, fewer bills are issued in the weekly tender to the London money market; whereas when the account is acquiring gold, it reduces its holding of Treasury bills so that more bills are issued by tender. Thus the size of the tender issue from time to time, in comparison with the total size of the floating debt, gives a rough idea of which way the exchange account is operating, and also of the extent of its operations. At times, however, the exchange account may not be able to reinvest its sterling as quickly as it acquires it. On these occasions money piles up temporarily in public deposits at the Bank of England, while the banking system experiences a transient shortage of cash. Relief, then, has to be given through a reduction in the weekly Treasury bill issue and also by official purchases of bills in the London market.

The following table shows the composition of the British floating debt at various dates. Tender bills are those issued to the banking system. Tap bills are those issued to public departments and others, including those bills issued to the exchange equalization account. Part of the exchange account's sterling assets may also be represented in the item, Ways and Means Advances from public departments.

	Floating Debt (£ millions)							
	Tender Treasury Bills	Tap Treasury Bills	Ways and Means Advances: Public Debts	Ways and Means Advances: Bank of England	Total	New York Exchange	London price of Gold	
1938						$	s	d.
Jan 15 .	612	309	35	—	956	4 99½	139	7½
April 9	512	305	31	5	853	4 96¼	140	1½
June 4	575	309	44	2	930	4·94¾	140	8
July 30	565	309	47	—	921	4 91½	141	6
Oct 8	521	379	49	4	953	4 78½	145	4½
Nov 28	522	404	45	—	971	4·64½	149	10½
Dec. 31 .	488	498	46	5	1,037	4.64½	149	7½

Up to March, the exchange account was on balance gaining gold from France and therefore reduced its holding of sterling, and the table shows a reduction of tap issues of Treasury bills during that period The fact that the tender issue also contracted was due to the usual spring reduction of the floating debt. In May came the first and biggest repatriation of funds to France This necessitated substantial sales of gold to the French exchange fund, so that the British exchange account could obtain the francs it needed to sell in the market with the object of preventing a rapid depreciation of the pound against the franc. On this occasion the exchange account was unable to re-invest at once all its new accretion of sterling, and public deposits at the Bank of England (*q.v.*) rose from £10 to £36 millions during the week ended May 11 and remained high during the whole of May. Payment of the June 1 War Loan dividend was largely financed out of the exchange account's sterling resources, the account receiving tap Treasury bills instead, so that this cash was by June restored to the banking system. The net result was an increase in the tap Treasury bill issue of about £30 millions between May 7 and June 3, this representing the re-investment of the exchange account's new sterling.

The September crisis witnessed large-scale movements of foreign funds from London, mainly to New York, but also to other centres such as Holland, Switzerland, and Scandinavian countries. This movement had again to be looked after by the exchange account. Its support to the pound took two main forms. First, it sold gold direct to the American authorities in exchange for dollars, and then used these dollars to meet the demand which arose in the London foreign exchange market in connexion with the outflow of funds to New York. Next and simultaneously it sold gold for sterling in the London bullion market. Much of this gold was bought by *arbitrageurs*, who shipped the gold to New York, and sold it to the American authorities, meanwhile selling in the London foreign exchange market the dollars which they received for their gold. Whether the exchange account shipped gold itself to New York or sold it in the London bullion market, the result was the same. The exchange account acquired sterling, while dollars came on offer in the London foreign exchange market to meet the demand created by the outflow of funds to New York This outflow, however, was a major movement which was too great for the exchange account to check altogether. The result was depreciation of the pound from 4·91 at the end of July to a momentary low point of 4·62 immediately prior to the Munich agreement.

These operations had the same effect on the money market as those necessitated by the May French repatriation movement, though on a much larger scale. Once more money accumulated in public deposits, the peak figure being £32 millions on Sept. 7. Moreover the exchange account had to take up fresh Treasury bills, and during August and September and early October the tap issue rose from £309 millions to £379 millions. In addition the exchange account had to buy bills in the money market, and these bills having been originally issued by tender cannot be detected in the table analysing the floating debt. It is noticeable, however, that between the end of July and early October the total tender issue fell from £565 millions to £521 millions. There was a further decline to £488 millions by December 31.

While the exact extent of the exchange account's operations remains a secret, the actual movements of gold into and out of the country are plain. These are shown in the following table covering the period from Aug 5 to Oct. 6.

Gold Bullion Exports from the United Kingdom

Total	11,264	16,623	34,547	62,434

In brief, during those two months England exported £151 millions of gold, against imports of only £62 millions, of which £33 millions represented gold sent to London by the Belgian authorities for safe custody. The real British net export was therefore about £120 millions. Practically all this gold must have come from the exchange equalization account's reserves. On the other hand, at the height of the crisis there was a rush in London to dishoard gold, inspired by the fear that if war broke out gold might be acquired compulsorily by the authorities of the various countries concerned. Much of this gold was offered to the London bullion market and bought up by the British exchange equalization account. Thus its net loss during these two months must have been less than £120 millions. An almost complete picture of the effects both of the May French repatriation and of the September crisis is shown by the return of the exchange account's gold holdings dated Sept. 30. These reveal a loss during the preceding six months of 21 million ounces, which at 140*s.* an ounce equal £147 millions and at the Sept. 30 price of 144*s.* 1*d.*, equal £151 millions.

The year's last three months saw a fresh dram of funds from London. This was due partly to the dubious view taken of the international political outlook, partly to the October recovery in Wall Street which attracted funds from London for investment, and in November to the French repatriation movement to France already described. Again it is impossible to assess the full extent of the exchange account's gold losses, but it is noticeable that between Oct. 8 and Dec. 31 the tap issue of Treasury bills rose from £379 millions to £408 millions. There was also the now familiar temporary accumulation of funds in public deposits which in November rose once more to over £30 millions. Complete evidence that a fresh major movement was at work is found in the depreciation of sterling from $4·81 on Oct. 6 to a low point of $4·62 on Nov. 28. The following week witnessed a rally to $4·69 largely due to the fact that the exchange market had run itself short of sterling. This must have enabled the exchange account to recover a fraction of its recent losses, but the rally did not persist. Early in 1939 the exchange account's gold reserves were reinforced by a transfer of £350 millions of gold from the Bank of England.

Little is known of the operations of the exchange funds in other countries. The increase in the American monetary gold stocks is shown in the first table. It is to be noted that as part of Washington's new efforts at reinflation the American exchange stabilization fund has released to the general banking system the dollar assets which it held for a short time. Thus it can no longer pay for gold, which in turn prevents it from adding to its gold stocks. Most of the United States' 1938 gold acquisitions, therefore, went in the form of gold certificates to swell the reserves of the Federal Reserve System—that is they passed into the internal banking system.

The Dutch exchange fund had in the main to cope with a steady demand for guilders, as funds came into the country. Until the September depreciation of sterling, it made its main object the maintenance of a fixed exchange rate of florins to the pound; but in September it had to give this up as a bad job, and let the guilder appreciate against the pound and follow the dollar. The Belgian authorities have had to contend against various vicissitudes, including the Daladier depreciation of the French franc, which made the belga appear over-valued. On the whole they have coped with these successfully.

Considering the major political disturbances of 1938, the final conclusion must be that the world's monetary authorities, operating through their various exchange funds, have preserved a much greater degree of monetary stability than might have been expected. Exchange fluctuations, of course, have occurred, and there has been the Daladier depreciation of the franc. But the crisis drop in sterling, serious though it appears, was only six per cent. Without the present degree of internal monetary control and international co-operation, much greater fluctuations might easily have occurred. (N. E. C.)

EXCHANGE RATES. The year 1938 falls naturally into three parts. The first ends with M. Daladier's depreciation of the franc at the end of April, and its fixation at a lower limit of value equal to Frs. 179 in the pound. This had the important implication that the franc was regarded as being linked to sterling. The second period ends with the Munich Agreement, while the third period embraces the ensuing *malaise*, which persisted for the rest of the year.

The first period was one of a continual outflow of funds from France, combined with an over-valuation of the pound against the dollar. The pound was then quoted at well over $4·90, and it was probably only held there by the persistent demand for sterling created by the flight to London of French capital. The birth of the Daladier franc in May was followed by the first rush of funds back to France, and while this was short-lived, the long-term result was that sterling lost this particular prop. Thus during the summer sterling sagged. In August and September came the crisis flight of funds from London (and Europe) to New York, and while it was entirely *foreign* money which fled from London, the effect on the pound was the same. The British authorities lost large quantities of gold (*see* EXCHANGE EQUALIZATION FUNDS AND GOLD MOVEMENTS), and the pound fell on Sept. 28 to $4·66¼.

The period since Munich was one of general nervousness. Sterling initially recovered to $4·83, but a further efflux of funds from London took place in October. In November, the political successes of M. Daladier and M. Reynaud caused the second rush of funds back to France, which took place during the year. For these reasons sterling was again weak, falling to $4·66 at the end of November, and rallying slightly during the next few days. Francs conversely strengthened to under Frs. 178 to the pound.

While the exchanges were mainly at the mercy of capital movements inspired by political doubts and fears, there was in the background the persistence of Great Britain's adverse balance of payments. In 1937 this amounted to £52 millions, and it may well be as much in 1938. Still one consequence of the pound's depreciation during the year is that it has become much less over-valued than at the end of 1937: $4·67, in fact, is a much more natural value for the pound than $4·99, and to that extent the year's movements have helped to create equilibrium. Psychologically they have also had the beneficial result of destroying any illusions about the sanctity of the old parity of $4·866.

In the sterling area, the year's political history had some repercussions, for the Scandinavian countries shifted some of their money from London to New York. They also strengthened their gold and foreign exchange reserves. The main influence, however, was the world trade recession and fall in the prices of primary products. This affected the export trade of many countries, and so to some extent upset their exchanges. Thus in India, the Reserve Bank had to abandon in April the rate of 1*s*. 6⅛*d*. for the rupee, and allowed it to slide to 1*s*. 5 13/16*d*. It soon recovered to 1*s*. 5 15/16*d*., but the net decline, though small, is symptomatic of the deterioration of India's trade balance and of the depletion of the Reserve Bank's external balance. Australia and New Zealand lost part of their London funds for the same reason, and at the end of the year, New Zealand suspended the convertibility of her note issue into sterling, and imposed a form of exchange control applying to both exports and imports. The recession equally made itself felt outside the Empire. In November, Argentina raised the official import exchange rate from 16 to 17 pesos to the pound (plus commission), while during the year the "free" rate depreciated from 17·03 to 20·58½ pesos to the pound.

The Continental countries with free exchange strengthened their position against sterling. Holland experienced a steady demand for guilders, due to an influx of funds. Up to the crisis the Dutch authorities tried to peg the guilder at about Fl. 8·95 to the pound, but in September they had to abandon their policy, and the guilder then

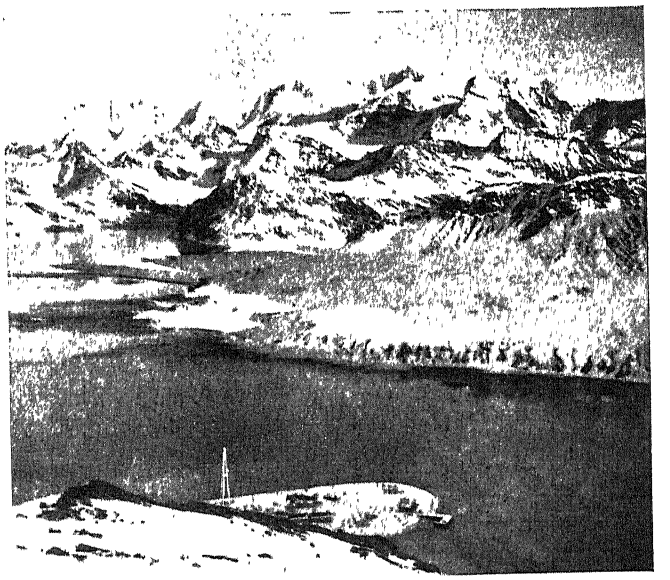
appreciated against sterling in sympathy with the dollar. The Belgian exchange was subject to more vicissitudes, due both to political fluctuations inside Belgium and also to the suggestion that the Daladier depreciation of the franc had caused the belga once more to become over-valued. Nevertheless, the belga appreciated during the year against sterling, and on the whole held its ground in New York. The Swiss exchange moved broadly in sympathy with the dollar.

Published exchange rates give little indication of the year's trends in the "controlled" countries—Germany, Italy, Central and South-Eastern Europe. Much of these countries' trade is conducted through exchange payments and clearing agreements, and in Germany's case, prices, special exchange rates and subsidies for both imports and exports are all used simultaneously as complementary levers for guiding trade to her advantage. The general trend of the year, in fact, has been the development of a kind of "reichmark area", analogous in some ways (but not all) to the sterling area, though with the fundamental difference that the latter is mainly a "free exchange" area. Where contact exists with the outside world, there were certain signs of weakness. Thus the registered mark rate depreciated to a discount of 67½ per cent during the crisis, and in spite of its later recovery shows a net depreciation over the year. In many South American countries trade with Germany is still conducted on a compensation basis, involving the use of special "aski" marks. These are quoted at a discount below the rate for free marks, but while still substantial, the discount showed a tendency to narrow during 1938. In Brazil it shrunk from 29·7 to 16·2 per cent during the year to Oct. 1938, in Colombia from 18·3 to 16·0 per cent, and in Peru from 21·8 to 19·5 per cent. These movements suggest that these countries strengthened their position *vis-à-vis* Germany, but Germany could easily off-set such movements by adjustments in subsidies. On the other hand, Brazil temporarily suspended during 1938 aski mark sales of cotton and coffee to Germany.

Far Eastern exchanges remained under war influences. The Japanese exchange is rigorously controlled, while the Chinese dollar steadily depreciated. There was also a temporary drop in the Hong Kong rate. (N. E. C.)

EXPLORATION AND DISCOVERY. Geographical, archæological, and other scientific expeditions, besides small private parties and individuals were at work in many parts of the world in 1938. It is convenient to divide them into three geographical groups as follows, Asian and African, Polar, and North and South American exploration, and to treat the more important of them under these headings.

Asian and African Exploration. H. St. John Philby made a crossing of south-west Arabia from the Red Sea to



the Indian ocean. Sir Aurel Stein was assisted by the British Royal Air Force in his attempts to demarcate the Roman Empire boundary in present-day 'Iraq. Sir Aurel's work will be incorporated in the international map on the 1 : 1,000,000 scale. During 1937–38 Miss Freya Stark was engaged on historical research in the Hadhramaut in southern Arabia. Frederick Simpich and W. Robert Moore made extensive journeys in the Near East collecting information for use in the construction of the U.S. National Geographic Society's map of "Bible Lands and the Cradle of Western Civilization". Exploring the tributaries of the Sepik river in an attempt to find an easy route to the interior, J. L. Taylor was, at the year-end, mapping one of the last unknown regions of New Guinea Territory (Australian mandate). In June, the Richard Archbold New Guinea expedition began a two-year study of primitive life, and a collection of the fauna and flora in unexplored portions of Netherlands New Guinea. An Everest reconnaissance expedition, sponsored by the Royal Geographical Society, reached an altitude of 27,000 feet before being driven back by storms. Capt. C. W. R. Knight, leader of the 1937–38 National Geographic Society South African expedition, succeeded in making a day-to-day photographic record of the nesting habits of a pair of fierce crowned eagles. V. E. Fuchs in 1938 resumed, in Rukwa Rift Valley of south-west Tanganyika, his work on the structure of Africa.

Polar Exploration. Lincoln Ellsworth and Sir Hubert Wilkins began their expedition in the Antarctic in October 1938; by the middle of December the party aboard the base-ship, "Wyatt Earp", reported it was within 150 miles of the nearest known edge of the solid Antarctic ice barrier. The explorers planned to map the Enderby Quadrant from the air.

The British Graham Land expedition discovered King George VI Sound, separating Alexander Island from the antarctic continent. Its leader, John Rymill, was awarded the Royal Geographical Society's gold medal in 1938. R.R.S. "Discovery", sent on her fifth two-year commission in Oct. 1937, has made expeditions from Capetown, making a brief survey of Balleny Islands and studying seasonal changes in the distribution of whales and plankton, in relation to the position of the ice-edge. R.R.S. "William Scoresby" returned in April 1938 from a seven-month expedition marking whales in the Indian Ocean, and set out again in August on a 17-month antarctic expedition to mark whales for a study of their migrations.

Between Aug. 1937 and March 1938, Sir Hubert Wilkins, who led one party of searchers for the Russian airmen lost while flying over the North Pole in Aug. 1937, flew over 170,000 sq. miles of the Arctic ocean, of which 150,000 sq. miles had never been seen before. Sir Hubert published an account of these flights in the *National Geographic Magazine*. The U.S.S.R. arctic expedition, which had camped nine months on an ice-floe, was rescued in Feb. 1938 near the point at which the Greenland sea joins the Atlantic ocean, having drifted 1,560 miles from a point within 34 miles of the North Pole. The expedition's records on terrestrial magnetism and gravity were especially detailed.

An island 200 sq. miles in area was discovered between Amund Ringnes island and Axel Heiberg Land by the British arctic expedition, led by D. Haig Thomas. Scientists from the Imperial College of Science, London, led by Alexander King, made a geographical survey of the southern part of Jan Mayan island, collected marine specimens, recorded the presence of cosmic rays, collected stratosphere air samples to determine helium content,

F. C. Fraser; from D. Ommanney's "South Latitude"

KING EDWARD'S POINT, SOUTH GEORGIA, WHERE ARE GOVERNMENT OFFICES AND THE "DISCOVERY" EXPEDITION'S MARINE BIOLOGICAL STATION

took magnetic measurements, and made the first land circuit of the island.

The MacGregor arctic expedition, under the leadership of Clifford J. MacGregor, returned to the United States in October after spending 15 months collecting meteorological information. Lieut.-Comdr. I. Schlossbach, a member of the party, flew over the supposed Crocker Land area without seeing land. Louise A. Boyd directed detailed surveys of Germania Land, Greenland, as part of her work for the American Geographical Society.

T. H. Manning continued the survey work of the British Canadian arctic expedition from his base on Southampton Island. Dr. Adolf Hoel led the Norwegian expedition which completed the air survey of the Svalbard archipelago. Dr. Lauge Koch, leader of the Danish arctic expedition, reported that the Fata Morgana islands, supposed to lie between Spitsbergen and Peary Land, were not visible during the flight he made over the region. Dr. E. S. Lingren and Andrew Croft carried out three months' ethnological research in Lapland during the winter 1937–38.

N. and S. American Exploration. In 1938, Bradford Washburn, conducting the Harvard University-National Geographic Society Alaskan expedition, discovered a giant ice-field filling vast valleys at an altitude of 5,000 to 7,000 feet in the region of the Chugach and St. Elias mountain ranges. Wendell Chapman conducted an expedition for the National Geographic Society in the northern Rocky Mountain region, where photographic studies were made in colour of small mammals and birds. E. R. Blake, Field Museum of Natural History, completed a thirteen-month field trip to British Guiana and Brazil during which he collected animal and bird specimens. Dr. G. H. H. Tate, American Museum of Natural History, led the Phelps expedition which explored Mount Auyan-tepui, an elevated plateau 300 sq. miles in area in southern Venezuela. Exploring the jungles of British Guiana and Brazil for the same institution, Dr. W. H. Holden led the Terry-Holden expedition from Georgetown to the Amazon by way of the Sierra Acarai mountains, a route previously untraversed by white men, collecting information on primitive medical practices. Lord Moyne, in his yacht the "Rosaura", visited Bay Islands, off the coast of Honduras, and made a collection of archæological specimens. (G. Gr.)

EXPORTS AND IMPORTS. The year 1938, compared with 1937, was a year of recession. The primary producing countries experienced a shrinkage in the value of their exports, which was due largely to a fall in the prices their exports realized. Meanwhile, they were still importing goods ordered during the period of greater prosperity, which ended in the middle of 1937 Therefore, during the latter part of 1937 and the earlier part of 1938, they experienced a serious deterioration in their balance of payments. During the last half of 1938, they were cutting down imports, and their balance of payments began to look a little better, but their imports underwent a further shrinkage

The United Kingdom. The industrial countries, such as the United Kingdom, had a parallel experience. The fall in world prices reduced the value of their imports of food and primary products, and so reduced the value of their total imports Their exports declined in volume, and so there was some decline in their value Yet on the whole the decline in value was more marked in the case of imports, and so, in the United Kingdom, there was a shrinkage in the actual import surplus On the other hand, the United Kingdom must have experienced some decline in invisible exports, such as shipping earnings and the return on overseas investments. It is doubtful if the complete balance of payments for 1938 will be any better than that of the previous year, which showed a deficit of £52 millions.

Monthly Average	Retained Imports (£ millions)	Exports of British Goods (£ millions)	Import Surplus (£ millions)
1929 . .	92 6	60·8	31·8
1934 . . .	56 7	33·0	23·7
1935	58·5	35 5	23 0
1936 . . .	65·7	36·7	29·0
1937 . . .	79 5	43 5	36·0
1938 . .	71·5	39·2	32·3

The table shows that in value both imports and exports have shrunk since 1937 by ten per cent. The import surplus has therefore shrunk by the same amount. But the volume indices for the first nine months of the year tell a somewhat different story :

1938 *compared with* 1937 (*first nine months*)

	Retained Imports Per cent	Exports Per cent
Value . .	— 5·7	— 10 2
Volume . .	— 1·3	— 12·7
Average Price	— 4·4	+ 2·8

Up to the end of Sept. 1938, the shrinkage in the value of retained imports was not unduly marked. It was also due much more to a fall in their average cost than to a shrinkage in their volume. The 10·2 per cent decline in the value of British exports, however, was entirely due to a shrinkage in volume. Their average price was 2·8 per cent higher than in 1937. In 1938 Great Britain was getting more in imported goods for each volume unit of her exports, but as a result of the higher prices she was charging, she was able to export less.

These trends are further illustrated by the following summaries of the trade returns of different countries :

The United States. The American returns tell a different story, partly because of an important new factor. For several years prior to 1938, the United States had a shortage of wheat, and so much so that she had to turn importer. In 1938, however, she was able to resume her normal function as an exporter of wheat. This greatly mitigated the contraction in her exports, which was a normal consequence of the 1937–38 trade recession, and fall in prices. These latter influences, however, exercised their full force on her imports, which were also reduced because she no longer had to import grain in such large quantities. For these reasons the value of her imports fell by 37·5 per cent, while her exports only fell by 7·8 per cent. The result was an enormous increase in her export surplus There was, however, some improvement in her imports towards the end of 1938 The figures quoted in the table are not strictly comparable, as they only embrace the first ten months of 1938.

Monthly Average	Retained Imports ($ millions)	Domestic Exports ($ millions)	Surplus of Exports (+) or Imports (−) ($ millions)
1929 . .	362	430	+ 68
1934 .	138	178	+ 40
1935 . .	171	190	+ 19
1936 . .	202	205	+ 3
1937 . . .	257	279	+ 22
1938 (10 months) .	161	255	+ 94

France. The French trade returns were necessarily affected in 1938 by the further depreciation of the franc. But while the franc value of imports rose since 1937 by only 6·2 per cent, that of exports increased by thirty per cent. The big disparity between these percentages shows that French export trade has been greatly helped by the May 1938 devaluation. The increase in the value of imports, in fact, is hardly proportionate to the depreciation of the franc, thus indicating some contraction in volume. The increase in the value of exports is great enough to point to an increase in volume.

Monthly Average	Imports (Frs millions)	Exports (Frs millions)	Import Surplus (Frs millions)
1929 . .	4,852	4,178	674
1934	1,925	1,487	438
1935 .	1,745	1,289	456
1936 . . .	2,117	1,288	829
1937 .	3,526	1,995	1,531
1938 (11 months) .	3,742	2,589	1,153

Germany. Fundamentally, Germany resembles England, for both are importers of foods and raw materials and exporters of finished goods. Yet in 1938 England reduced her import surplus, while Germany's export surplus gave place to an import surplus. There are various reasons for this. First, Germany has a controlled economy, the guiding principle of which is that imports are conditioned by exports. Hence there was no room for any increase in the 1937 export surplus ; and had matters so worked out as to bring about an increase, it would immediately have been used to permit of an expansion in imports. This, however, does not explain the replacement of the export surplus by an import surplus.

The reasons for this are largely political. In March 1938, there was the *Anchluss* with Austria, and in October the absorption of the Sudetenland. The latter occurred too recently to affect the 1938 trade returns, but the union with Austria was, from the point of view of Germany's

trade balance, a liability. Many of Austria's exports formerly went to Germany, and so now disappear from the combined trade return of the two countries. On the other hand, Austria has to import some of her staple food supplies, and these come from countries outside the enlarged German Reich. Another cause of Germany's deficit in 1938 lies in her intensive rearmament efforts, including the autumn mobilization of the army. The existence of the deficit looks as if Germany was partially living for 1938 upon the former Austrian gold reserves. But these are not inexhaustible, and so it was not surprising that by the end of the year Germany was making every effort to expand her export trade.

Monthly Average	Retained Imports (Rm millions)	Domestic Exports (Rm.millions)	Surplus of Exports (+) or Imports (—) (Rm millions)
1929 . . .	1,120	1,124	+ 4
1932 . . .	380	478	+ 89
1933 . . .	350	406	+ 56
1934 . . .	371	347	— 24
1935 . . .	347	356	+ 9
1936 . . .	352	397	+ 45
1937 . . .	456	493	+ 37
1938 (10 months) .	449	432	— 17

Some Primary Producing Countries. In conclusion, a comparison of 1937 and 1938 for three primary producing countries is of interest:

	First Nine Months of		Change
	1937	1938	
Australia (£ *stg. Millions*)			
Imports . . .	73·2	80·7	+ 7·5
Exports . . .	106·9	94·8	— 12·1
Difference . .	+ 33·7	+ 14·1	— 19·6
India (*Rs. millions*)			
Imports . . .	1,156	1,053	— 103
Exports . . .	1,590	1,191	— 399
Difference . .	+ 434	+ 138	— 296
Argentina (*pes. millions*) .			
Imports . . .	1,160	1,100	— 60
Exports . . .	1,872	1,046	— 826
Difference . .	+ 712	— 54	—766

In all these countries the drop in imports between 1937 and 1938 is relatively less marked, showing how the goods ordered during the 1936–37 period of prosperity continued to arrive, in all three cases up to the end of the first quarter of 1938. The contraction in exports, on the contrary, is very noticeable indeed. Australia and India maintained their normal export surplus, although it became insufficient to cover their external liabilities on income account. Argentina, who equally has external liabilities to meet, lost the whole of her export surplus. (N. E. C.)

EXTRA-MURAL EDUCATION: *see* ADULT EDUCATION.

EYE, DISEASES OF. Progress of especial importance has been made in recent years in the following branches of ophthalmological practice.

Detachment of Retina. The retina is a delicate membrane-like tissue which lines the posterior two-thirds of the interior of the eyeball, and contains the light-sensitive elements from which impulses are transmitted through the optic nerve to the brain; normally it lies in close apposition to the pigment epithelium, which clothes the middle, or choroid, coat. Separation of the retina from the pigment epithelium occurs not uncommonly, independently of inflammation or tumour-formation; especially in the abnormally long eyeball associated with myopia or short-sight, often as an immediate or remote consequence of a contusion. Ophthalmoscopic examination will very frequently reveal the presence of a hole in the detached retina, lanceolate or horse-shoe shaped, or in the form of a rift at the anterior insertion, through which fluid is able to pass behind the retina. Sight is defective, with distortion of images and more or less loss of the visual field corresponding to the area of detachment. Under treatment other than operative, the eye usually becomes, sooner or later, totally blind, and in cases of long standing it is not infrequently attacked by a painful inflammation which may necessitate its removal. The percentage of successful results of operation was almost negligible until, in comparatively recent times, Prof. J Gonin [1] described a procedure involving accurate localization of the situation of the retinal hole, or tear, with reference to the surface of the eyeball, and proved that by cautery puncture of the coats of the eye at this point, the rent could be occluded and a high percentage of cures obtained. Subsequently a great deal of work has been done in elaborating the technique of operation, the various methods advocated having as a common aim the induction of foci of plastic inflammation in the choroid coat so situated that, after withdrawal of the subretinal fluid the retina will become adherent to, and eventually fused with, the choroid so as to occlude the hole. Statistics show that at the present day in experienced hands fifty per cent of successful results of operation is not unusual.

Theodore Hamblin Ltd]

CONTACT LENSES, WORN BENEATH THE EYELIDS AND INVISIBLE IN USE. DOTTED LINE INDICATES EDGE OF LENS.

Contact Glasses. [2] The idea of correcting an error of refraction by means of a glass in direct contact with the eyeball is more than a century old [3], but until recent times the use of contact glasses got little farther than the experimental stages, mainly on account of the great technical difficulties involved in their construction.

A contact glass consists of two segments so as to bear some resemblance to a cardinal's hat with the brim turned downwards, the radius of curvature of the crown corresponding with that of the cornea or clear window of the eye,

and the radius of curvature of the brim so closely with that of the surface of the eyeball adjacent to the cornea that there is exact apposition of the surfaces at all points; furthermore, the incorporation of a lens in the corneal position of the glass is often required, and at the same time the glass must be extremely light and yet sufficiently strong to withstand the strains incidental to its use.

The earliest type of contact glass was blown. It could usually be worn comfortably, but did not give an accurate correction of error of refraction It was superseded by a ground glass, which corrects error of refraction with greater accuracy, but is difficult so to construct that the brim does not cause uneven pressure and consequent discomfort, and requires the occupation of the narrow space between cornea and glass by saline fluid. The most modern type of glass is moulded on a cast made from the front of the eyeball, and always has spherical lens power ground on its anterior surface. When fitting is perfect, there is very little interference with the blood and lymph circulation and the movements of the eye, and the glass can be worn all day without discomfort

Contact glasses are of great value for the correction of the peculiar astigmatism produced by conical cornea, which can seldom be at all adequately corrected by a spectacle lens, and occasionally for the correction of irregular astigmatism associated with old corneal scars, and for extreme short-sight.

Corneal Grafting. Corneal grafting, with a view to improvement of a gross defect of sight, due to corneal opacity, by the substitution of clear corneal tissue of alien origin for a portion of the opaque cornea, is more than a hundred years old, but it is only during recent years that very considerable progress has been made in this branch of surgery.[4]

F

FAIRBAIRN, STEPHEN, British rowing coach, was born on Aug. 25, 1862, the son of an Australian sheep-station owner, and died in London on May 16, 1938. He was educated at Geelong Grammar School and Jesus College, Cambridge. Between 1882 and 1886 he rowed in two losing and two winning Cambridge crews against Oxford, besides winning many honours for Jesus College on the Cam and at Henley. As a coach he made his name through the success of his "unorthodox" emphasis upon the importance of leg drive, even to the exclusion of body swing and all other aspects of the art of rowing, and his training of comparative novices on sliding seats instead of fixed seats. It is, perhaps, just to say that his greatest crews were those that approached, though by means of his distinctive methods, most nearly to the ideal of the old "orthodox" school of rowing.

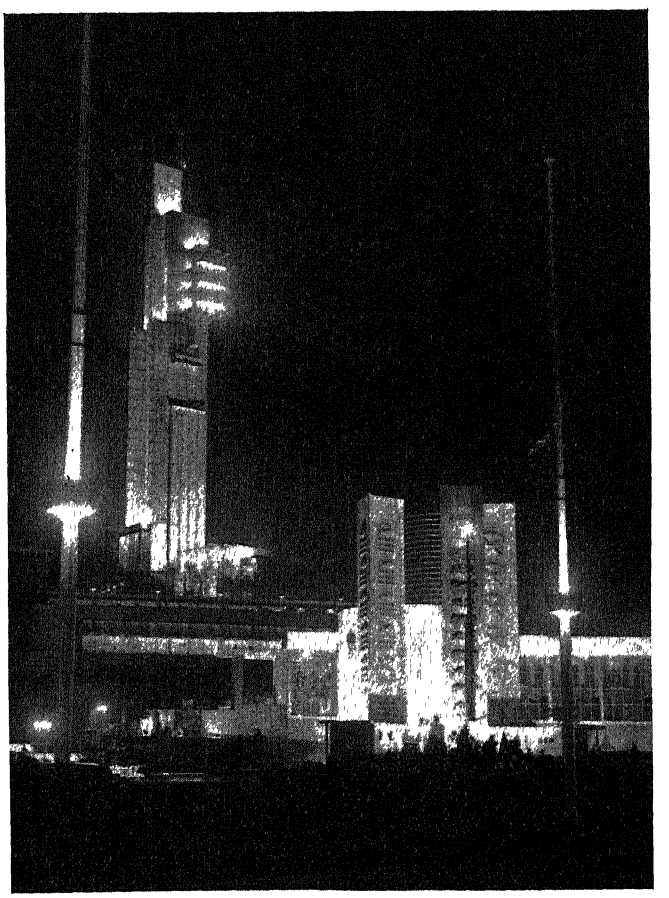
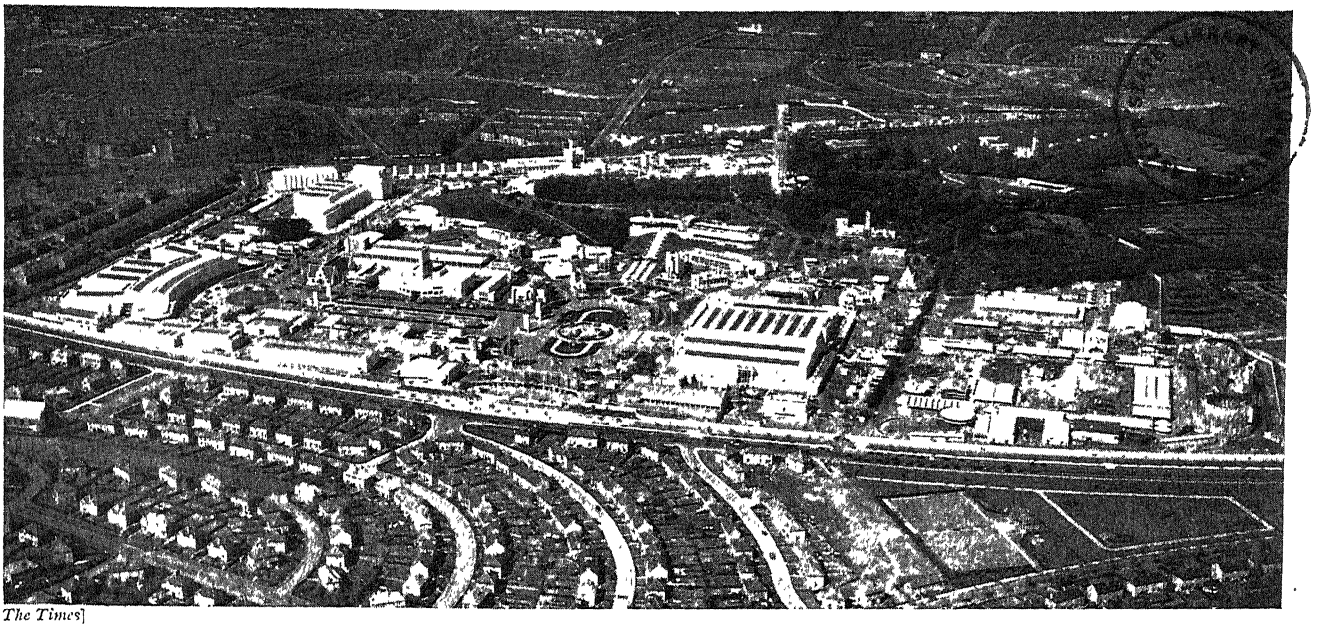
STEPHEN FAIRBAIRN

FAIRS AND EXHIBITIONS. On May 3, 1938, His Majesty King George VI, accompanied by the Queen, opened the Empire Exhibition at Bellahouston Park, Glasgow. Queen Mary, the Princess Royal, and other members of the royal family visited the exhibition before it closed on Oct. 29. Visitors from all over the world included organizers of the 1939 New York World's Fair and other coming fairs, Danish newspaper editors, and eighty unemployed men, the guests of the Queen. The International Advertising Conference and the International Engineering Congress were held at the Exhibition.



Lord Elgin was president of the Exhibition; Captain S. G. Graham, the general manager; Mr. C. M. Weir, the chairman of the Administrative Committee; and Mr T. S. Tait, the chief architect. The Exhibition covered 175 acres, and included over 100 buildings having a total floor area of one million square feet and costing £10 millions. The largest attendance, on the last Saturday, was 364,092, and the total attendance was 12,593,232. A fine double avenue contained the dominions and colonial exhibits. The Canadian pavilion was built of Douglas fir and Canadian spruce, the South African pavilion reproduced a colonial farm-house. Southern Rhodesia showed a model of the Victoria Falls, which shared with Scotland's model highland village the honour of being the most popular exhibit. The Palace of Art, to which the King lent Wilkie's "Blind Man's Buff" and "The Penny Wedding" from Windsor Castle, will remain as a municipal art gallery. Other features included a 25-acre amusement park, the largest ever contained at an exhibition; the Palace of the Women of the Empire, two Palaces of Industry; a Hall of Engineering; and a 300-ft. Tower of Empire, affording views of Glasgow and its dockyard, and of the highlands.

The British Industries Fair, held in February in London and Birmingham, was visited by the King, the Queen, and Queen Mary. Both attendances and the volume of trade increased. All countries, except Germany and Japan, bought large quantities of toys, and Canada bought 70,000 razor sets.



The Duke of Kent opened the Motor Show at Earl's Court in October. There were no radical changes in the design of cars, comfort, value for money, and economy being the points stressed. Though attendances were lower, the number of orders was better than in the previous year. The Scottish Motor Show was well attended. Lord Nuffield opened the Cycle Show at Earl's Court.

At the National Radio Exhibition held at Olympia at the end of August, emphasis was laid on television. The Building Exhibition, at Olympia, was opened by Sir Philip Sassoon, first Commissioner of Works. Air Raid Precautions were the special feature.

The Grocers' 42nd International Exhibition illustrated the range of food-stuffs from Empire sources. Queen Mary visited the Leather Show held at Cordwainers' Hall in June. The Woman's Fair, held in November, was the first to be devoted entirely to the interests of women. It included home planning, furnishing, decoration, domestic science, careers, beauty, and fashion. At the Ideal Home Exhibi-

The Times]

GENERAL VIEW OF THE EMPIRE EXHIBITION, GLASGOW

tion, opened by Mrs. Neville Chamberlain, special features were the city of glass and the keep-fit demonstrations.

Europe. At the Leipzig Spring Fair, held in March, there were 9,549 exhibitors, an increase of 7·5 per cent over 1937. These included 818 firms from foreign countries, and trade visitors numbered 304,000. In the engineering section were interesting home-produced substitutes for metals. Herr Funk, German minister of economics, opening the Königsberg Industrial Fair in August, expressed satisfaction at the trade position of Germany The Berlin Radio Show in August was the largest ever held, and included the products of Austrian firms.

At the Paris Fair, held at the end of May, the electric-heating section was of special interest Little novelty was shown at the French Domestic Apparatus Exhibition, types were standardized, probably because of rapidly rising costs. The International Aero Show at Paris was postponed for eight days.

Oslo held a Norwegian Exhibition, the first big one since 1914, patronized by King Haakon Budapest City Fair celebrated its centenary in July. At the Prague Fair, held in September, glassware, porcelain, toys, and leather goods were the chief products.

Canada. Lord Stanley opened the Diamond Jubilee Toronto Exhibition, the largest annual exhibition in the world. The band of the Royal Artillery, Woolwich, visited Canada to play at the Exhibition. (V. R.)

United States. In 1939 two major exhibitions will be held in the United States of America; the Golden Gate International Exhibition at San Francisco, California, and the New York World's Fair in New York city. The exhibition in San Francisco opens in February 1939, on a man-made island of 400 acres in the centre of San Francisco Bay. The theme, "Recreation—Man's Gift from a Machine Age", will share in the dedication to Western and Pacific achievements, and to Transport and Communications as symbolized by the World's two largest bridges spanning San Francisco Bay, the transpacific air routes, the giant water and power projects of the west, radio, cinema, and television. After the close of the exhibition the island will become the metropolitan airport. This exhibition's palaces combine the beauty and dramatic phases of oriental and occidental architecture. Internally these palaces more nearly follow the older type plan of large halls with great roof spans, externally presenting an appearance and expression of unity and harmony. The main backbone of the plan is L shaped, made up of two avenues at right angles to each other. At this main intersection is a great circular court in which the dominating feature is the Exhibition Tower, 400 ft high

The New York World's Fair opens in May 1939, and presents an entirely different picture, being much larger in size, covering 1,216 acres, including gigantic parking areas, and transport facilities designed in anticipation of more than 60 million attendance The site is at Flushing Meadow Park, in the Borough of Queens, Long Island. Here the Exhibition is reclaiming a swamp which, at its close, is to become an important and large public park. The theme of the Fair speaks of the "World of To-morrow". It was the idea of its sponsors that the exhibits of industry, science, art, education, and governments should portray a vast panorama, showing that what man is building to-day will be the World of to-morrow, with emphasis on the vital necessity of rational co-operation among all the nations and peoples and classes.

The plan of the exhibition is functional in that the designers have placed an important plaza at each entrance, leading in through broad avenues to the focal theme building called the "Trylon and the Perisphere"; the Perisphere being a true sphere 180 ft. in diameter, alongside which stands the Trylon, triangular in plan and tapering to a point some 728 ft. in height. Inside this theme building will be a dramatic and serious presentation of the Exhibition's theme, emphasizing the interdependence of man. All phases of American industry, commerce, and transport will be shown, many in their own individual buildings. The architecture will reflect the individual freedom of thought of those creating it. Similarly this repeats itself in the most gigantic foreign participation that any American exhibition has ever had; some 63 foreign nations are showing in buildings adjacent to the United States Federal Group and surrounding the Court of Peace.

See Architectural Review, July 1938 (The Architectural Press, Queen Anne's Gate, Westminster, S.W.1).)

FALKLAND ISLANDS. The British colony of the Falkland Islands and Dependencies consists of the East and West Falkland Islands in the South Atlantic, and the Dependencies of South Georgia, South Orkneys, South Sandwich Islands, South Shetlands, and Graham Land. South Georgia (area 1,150 sq. miles) is the only area in the Dependencies habitable all the year: whaling is its industry.

Area and Population (Colony):
Area 4,618 sq. miles.
Population (est. Dec. 31, 1937) 2,391.
Governor. Sir H. Henniker-Heaton, K.C.M.G.
Production:
Colony (1937): Sheep, 604,346; Wool, 4,206,235 lb. (£259,512).
Dependencies (1936-37): Whale oil, £305,049; Guano, £34,328; Seal oil, £36,006.
Overseas Trade 1937, Colony and Dependencies:
Imports, £487,704; Exports, £601,662.
Finance 1938:
Colony: Revenue, £91,720; Expenditure, £80,945.
Dependencies: Revenue, £15,545; Expenditure, £13,829.
Education 1937. Children under instruction, 387.

FARM MACHINERY. The rapid and widespread development in the use of tractors in recent years represents marked changes in farm practices, speeding up, and an economic evolution in the farming industry comparable to modern developments in manufacturing industries. Significant in this progress are rubber tyres for tractors and the power take-off, a simple device originally developed in France. By means of the power take-off, general-purpose farm tractors supply not only the motive power to draw machines over fields, but also the operating power required by such machines as combines, which harvest and thresh grain in one operation. Formerly combines required their own separate, built-in power plant. As a result of the power take-off "baby" combines are in widespread use on smaller farms, whereas the former large combines were practicable only on very large farms. More efficient application of tractor power to tillage, planting, cultivating, and harvesting have developed a decided trend to the "family size" farm which can be power-operated with little or no outside help even in seasons of peak loads, such as harvest and planting time.

Combines are used in harvesting and threshing wheat, rye, oats, barley, beans, peas, alfalfa, and clover. A still smaller "baby" combine, to cut a swath of only 3 ft. 6 in., appeared in 1938. Most tractors now built have pneumatic rubber tyres for greater speed, comfort, and fuel economy. Tractors equipped with cabs appeared in 1938. Harvesting operations vary widely, but the top speed is now about ten miles per hour. That speed is being steadily increased, with possibilities of its being doubled some day.

According to recent estimates, farm tractors in Great Britain numbered 46,000 in 1937; in the United States (April 1, 1938) there were 1,527,989.

FASHION AND DRESS. In 1938 fashionable women the world over put their hair up on top of their heads. Immediately they looked like their own grandmothers. It was only logical, then, for so-called "daguerreotype" fashions to be revived. So this year produced a pageant of old-fashioned new fashions. Among these were small hats "perched" rather than "worn" on the head. For the first time in many years millinery was elaborately trimmed with ostrich feathers, flowers, ribbons, and, nine times out of ten, garnished with a veil. Hatpins were occasionally seen. High collars, sometimes even boned, came back. Shirt-waists appeared again. Muffs of all

Condé Nast Publications Ltd.]
IN 1938, WOMEN PUT THEIR HAIR UP AND WORE CLOTHES REMINISCENT OF THEIR GRANDMOTHERS

shapes and sizes, from pillow to pigmy, had a vogue. At night grand toilettes came into being—ball gowns, in fact. These were crinolines, often with strapless off-the-shoulder *décolletages*. Evening head-dresses of feathers, flowers, veiling, or ribbons made their appearance. Long gloves were revived. Velvet was tied round the throat; jewelled dog collars were worn, and the preference in jewels for the evening was for old-fashioned period pieces. In fact, all smart women in 1938 had definitely a period look. By day they tended to be Edwardian; by night they had a Victorian air about them.

Underneath these decorative and elaborate clothes more corsetting was logical in 1938. Since womanliness rather than sophistication, charm rather than functionalism, were the keynotes in dress during this year, even figures changed. Streamlining went out; small waists and curves came in. Hence, corsets were cut higher above the waist, were boned more than heretofore, and were even laced occasionally.

This general revival of femininity curiously seemed to produce two schools of dress design. The result of this was that half the chic women of 1938 looked as though they had walked out of a Toulouse-Lautrec canvas; the other half seemed to have stepped from the pages of Louisa May Alcott. But whether a woman's costume of the moment was in the naughty or the nice tradition, there was no doubt about one thing, and that was that she was a woman. Sex asserted itself in the mode of 1938 in no uncertain terms. Even sports clothes in this year grew more feminine and less functional. In this category of clothes, a peasant-like feeling seemed to be the inspiration. Women took to tying kerchiefs under their chins out-of-doors and to wearing full-skirted dirndl-like frocks in the country.

There were two exceptions to the generally delicate and feminine aspect of clothes in 1938. One had to do with furs. After years of svelte, sleekly fitting furs, a husky,

Eskimo type of coat became an accepted alternative. Often these coats were made with hoods. Hoods, as a matter of fact, were a 1938 idea that also frequently appeared on cloth coats (usually for sportswear) and on evening wraps. This new silhouette in fur coats also brought about the use of many long-haired furs which had a tendency to be light and speckled, such as lynx and South American guanaco Another important change in fur fashions was the declining use of silver fox as a trimming For years the silver fox trimmed coat had become almost a winter uniform with women of fashion In the winter of 1938, a number of them rejected it in favour of mink-trimmed coats.

The second exception to the prevailing preference for soft feminine design in 1938 occurred in the realm of shoes. The " platform " shoe, that is, the shoe with a built-up sole, sometimes shaped like a wedge and varying in thickness from about two to four inches, became generally popular, chiefly for beach and sportswear

As 1938 drew to a close, and the French dressmakers launched, in November, what is known as their Mid-Season Collections—their last word on fashions for the current year, and their first intimation of the shape of things to come in the New Year—women's clothes grew no less feminine, but they did grow younger. The mode took on an increasingly child-like air, expressed in such ways as demure petticoats made to show beneath the hems of frocks, modest *piqué* touches at the throat, young sailor hats clapped naively on the backs of smart heads. It began to look as though the " Little Women " were worsting the *femmes fatales*—as though Louisa May Alcott had triumphed over Toulouse-Lautrec.

Probably this was because the one thing that caused the whole mode of stately Edwardian clothes in 1938, namely, the hair up on top of the head, made women look older. They found that they liked being feminine again, but would it be human to expect them to remain for long content to look older ? In the end it seemed as though a compromise were found. As the year closed, it left women still revelling in their natural curves, their revived pink and white complexions, their general softness. But they began to wear their hair half-way between up and down, that is, piled high in front but cut and curled to the shape of their heads in back. This still achieved a period look, but it did not age. So the stately clothes the Edwardian *grandes dames* seemed to demand logically gave way to the new-old-fashioned " Little Women " frocks of the closing year.

Finally, the prevailing note of modesty and demureness in dress brought about yet another fashion known as monastic. It described dresses and coats cut like shifts, but anchored at the waist by simple belts. The result was a type of costume that hung in soft, easy folds, reminiscent of the habits worn by monks. (E. PE.)

FATHER DIVINE, spiritual leader of a community, chiefly Negro, in Harlem, New York city, and elsewhere. Over his birth in a southern state, there seems to be uncertainty, but his name is stated to have been George Baker. His age is somewhere about fifty. For a time, he lived in Baltimore and his religious fervour was characteristic of his race. His experience included repeated awakenings, and he developed a gift for evangelical oratory. From humble occupations in the garden, he emerged as Major J. Devin, which name became Father Divine, Dean of the Universe. His wife is known as Mother Divine. He asks for no collection, but those who confer their property and earnings on him, also assuming new names such as Onward Universe, are granted the dignity of Angel. Father Divine owns real estate in New York city and is responsible for various community enterprises. During the year 1938, he acquired an additional " promised land ", namely 500 acres at Krum Elbow on the Hudson, immediately opposite to the Roosevelt home at Hyde Park. Early in 1939 there was talk of his followers establishing a " heaven " in England. Father Divine's demeanour is friendly and cheerful His favourite greeting is " Peace Everyone ". The number of his disciples cannot be given precisely. It runs into thousands, but is sometimes exaggerated.

Associated Press]
FATHER DIVINE

FEDERAL BUREAU OF INVESTIGATION of the United States Department of Justice is charged with the duty of investigating violations of the laws of the United States, collecting evidence in cases in which the United States is or may be a party in interest, and performing other duties imposed upon it by law. Since the appointment of its present director, Mr J. Edgar Hoover, in 1924, the bureau's development has been along two lines : namely in detection and apprehension, and as a national service agency to all law enforcement organizations.

In the fiscal year of 1938, over 5,400 convictions were secured in cases investigated by special agents of the FBI. During the year 3,233 stolen cars were recovered which were transported in inter-State commerce. Since the passage of the Federal Kidnapping Act in 1932, 127 cases of kidnapping and plots to kidnap were reported to the FBI, and on July 1, 1938, 123 of the cases had been completely solved. Bank robbery reached its peak in 1932, and, following the passage of the Federal Bank Robbery Act in 1934, bank robberies have declined nearly eighty per cent. In the past year convictions were secured in 95·93 per cent of the investigated cases which were brought to trial.

In 1924, the Identification Division of the FBI was founded with a nucleus of 810,000 fingerprint records, and on July 1, 1938, nearly nine million fingerprint records were on file. Despite this growth, it is possible to identify an incoming set of impressions in three minutes. A total of 1,692,890 fingerprint records were received last year as against 1,382,666 in the preceding year. Nearly 57 per cent of all criminal prints received last year were identified after search through the files. The technical laboratory last year made 5,994 scientific examinations, 1,258 of which were for local authorities. These examinations involved over 66,500 different specimens.

The cost of operating the FBI in the past fiscal year was $6,200,000, while savings to the government, property recoveries, and fines imposed in cases investigated by bureau agents totalled over $47,000,000, or $7·64 for every one dollar spent. (*See* also CRIME ; KIDNAPPING.) (J. E. H.)

FEDERAL CAPITAL TERRITORY: *see* AUSTRALIAN CAPITAL TERRITORY.

FEDERAL RESERVE SYSTEM. Monetary and credit conditions in the United States continued extremely easy in 1938. During the year commercial bank reserves

in excess of legal requirements, which represent funds available for expansion of loans and investments, increased steadily. Private and other institutional investors also held a large volume of idle funds. As a consequence open-market money rates and yields on high-grade securities declined, and by the end of the year had either approached or established record low levels From the monetary standpoint, therefore, conditions remained favourable for encouragement of business activity and general economic progress

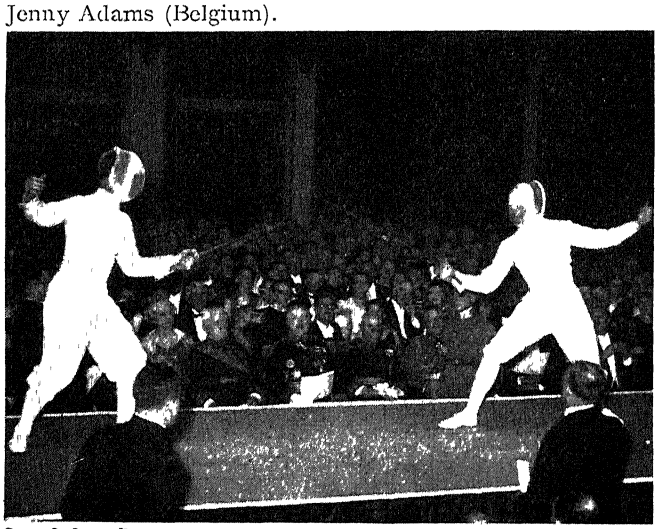
From the end of 1937, to early in December 1938, excess reserves of member banks of the Federal Reserve System, which comprise about eighty per cent of the country's commercial banking resources, rose by nearly $2,300 millions to the unprecedented level of $3,500 millions This increase resulted chiefly from (*a*) large gold imports, (*b*) expenditures by the Treasury from its inactive gold account, and (*c*) a reduction in reserve requirements by the board of governors of the Federal Reserve System. The latter two actions were taken as a part of the government's broad recovery programme announced in April

In Feb. 1938 the Treasury modified its gold policy of increasing reserve requirements and of accumulating gold stock in an inactive gold account by providing that from Jan. 1, 1938, gold acquisitions would be included in the inactive gold account only to the extent that such acquisitions exceed $100 millions in any calendar quarter.

In April 1938 the Treasury and the board of governors took action to increase the volume of member bank excess reserves. The Treasury discontinued the inactive gold account entirely and deposited with the Federal Reserve banks $1,400 millions of gold previously held in that account, while the board of governors reduced member bank reserve requirements by approximately $750 millions.

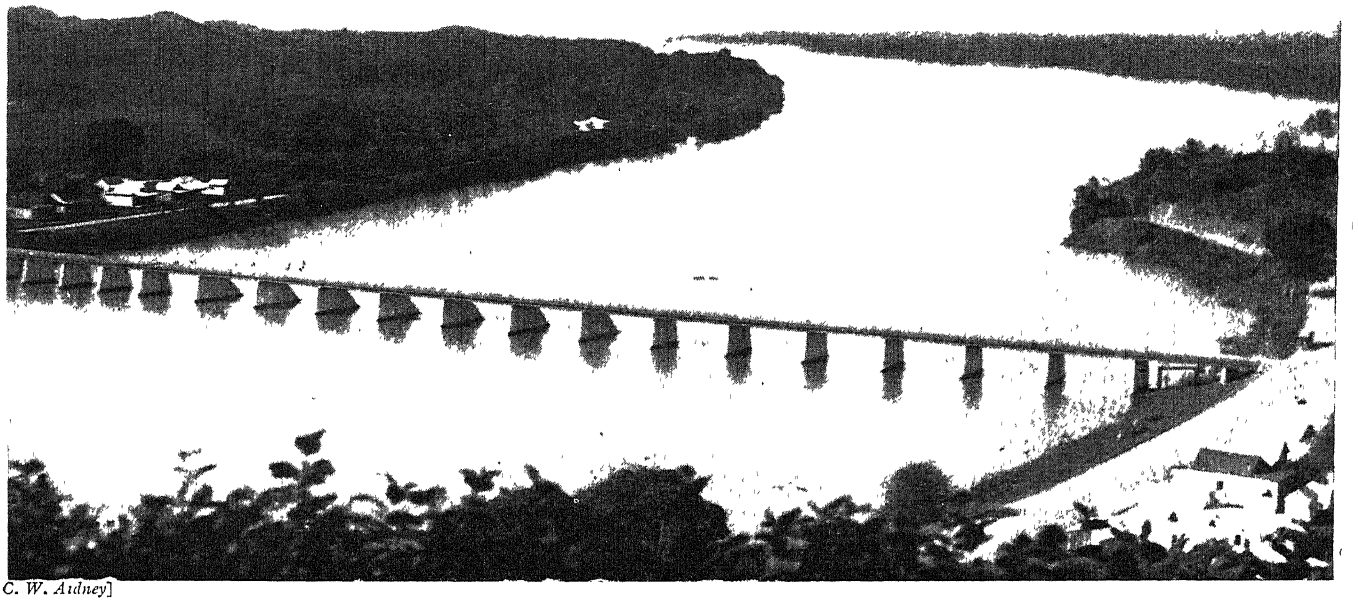
Although excess reserves are at a new high level, there is no immediate prospect of an inflationary expansion of credit. The principal concern of the Reserve System at present is to assure the maintenance of an abundance of funds in order that credit needs of business may be accommodated readily at low rates and thus contribute to the orderly continuation of the business recovery in progress since the spring of 1938. From a longer-term viewpoint, however, the existing large volume of excess reserves, which is likely to be increased substantially further over the period ahead, provides the basis for a potential expansion in credit and constitutes a possible threat to future economic stability. Should circumstances arise which might precipitate such an injurious expansion, the Federal Reserve authorities would need additional powers to deal with the situation. (M. S. E)

FEDERAL THEATRE is a project of the United States Works Progress Administration, organized under the Emergency Relief Appropriation Act of 1935 to give employment to needy professional theatre people. Payment at a security wage is less than the prevailing pay for corresponding work in industry, but adjusted, through hours, to meet that wage. Nine out of ten employed come from relief rolls. Nine dollars out of ten must be spent for wages, leaving only one dollar out of ten to meet all theatrical and operating costs. At the outset of the programme 12,700 people were employed in 29 States. Through the return of theatrical people to private industry, employment on Jan. 15, 1939 was 7,900 in twenty States.



The National Policy Board, made up of directors from each region, plans the season as a whole, and has consistently offered an ambitious programme of classical and modern plays, dance dramas, marionette shows, musical comedies, children's plays, and cycles by such distinguished dramatists as Eugene O'Neill and George Bernard Shaw. Over 100 new plays by American dramatists, many dealing with regional American material, have been produced.

The Federal Theatre has invented the technique of the "Living Newspaper", a terse cinematic type of production dealing with such social and economic subjects as agriculture, power, and housing Through its research division the Federal Theatre is conducting experiments in the fields of writing, design, and light. It also provides script and advisory service for community theatre groups in every State. A recent innovation is extensive touring through rural areas.



BIBLIOGRAPHY. Federal Theatre Plays: *One Third of a Nation*, *Prologue to Glory*; *Hail*, *Triple A Plowed Under*; *Power*; *Spirochete*, copyright 1938 by Random House, Inc, New York, Willson Whitman. *Bread and Circuses, A Study of Federal Theatre*, New York, Oxford University Press, 1937; *Brief*, delivered before the Committee on Patents, House of Representatives, Washington, D.C., Feb 8, 1938.

FENCING. The revival of interest in fencing in Great Britain has continued, and a number of important innovations have been made during the year. Among these are the official recognition of the university and public school championships; the inclusion of a ladies' team in the annual Anglo-Scottish match (won by Scotland); the establishment of West of England championships (held with great success at Falmouth), and an international meeting which took place at Hassocks, Sussex, and received excellent support from British and Continental fencers.

The final pool of the amateur épée championship, judged for the first time by the electrical apparatus, was won by C. L. de Beaumont, London Fencing Club, for the third successive year—a record for this event; J. Emrys Lloyd, also of the London, won the foil championship for the seventh time (another record), and A. G Pilbrow, of the Salle Bertrand, the sabre. The ladies' foil championship went to Mrs. C. Penn Hughes of Gauthier's; the Savage Shield team épée competition to the London Fencing Club, the Miller Hallet cup (individual épée) was won for the sixth time by C. L. de Beaumont, and the ladies' international championship for the Hutton Cup fell to Mlle. Jenny Adams (Belgium).

In the United States the national champions for 1937–38 were: foil, Dernell Every, N.Y.A.C.; épée, José R. de Capriles, Salle Santelli; sabre, John R. Huffman, N.Y.A.C., three-weapon, John R. Huffman, N.Y.A.C.; outdoor épée, M.A. de Capriles, Salle Santelli; outdoor sabre, John R. Huffman, N.Y.A.C; women's foil team, the Misses Helene Mayer, Dorothy Locke, and Marie Cerre.

FERNANDO PO: *see* SPANISH WEST AFRICA.

FERTILIZERS. The use of commercial fertilizers in world agriculture continues to show notable and persistent increase. The fourteen elements held essential to plant growth are well known. They are: nitrogen, phosphorus, potassium, calcium, carbon, hydrogen, oxygen, magnesium, iron, sulphur, manganese, boron, copper, and zinc. The carriers of nitrogen, phosphorus, and potassium are considered the most necessary ingredients in commercial fertilizers because most farm soils are deficient in these elements. Likewise, crops remove them and calcium in larger quantities than the other ten. Carbon, hydrogen, and oxygen are obtained by plants from air and water. With continued cropping it has become progressively apparent that certain soils are deficient in one or more of the remaining seven elements, now commonly referred to as the minor or trace elements. As a rule, it is necessary to add only relatively small amounts of the deficient elements.

Statements of some investigators that certain additional elements are essential to plant growth are the subject of considerable debate at the present time.

Recent outstanding manufacturing developments include the granulation of fertilizers and fertilizer materials. New products under experimentation are calcium metaphosphate and potassium metaphosphate.

World consumption of nitrogen in fertilizers in 1936 was 2,214,000 metric tons, contained in 12,013,000 tons of nitrogen-bearing materials, principally ammonium sulphate, nitrate of soda, and calcium cyanamide. World consumption of phosphates in fertilizers in 1936 amounted to 22,855,000 metric tons, including 15,700,000 tons of superphosphate and 5,000,000 tons of basic slag and containing 4,052,750 tons of phosphoric acid (P_2O_5). World consumption of potash in fertilizers in 1936 consisted of 7,061,500 metric tons of potash salts, containing 2,295,000 tons of pure potash (K_2O). Total world consumption of 41,929,500 tons of fertilizer materials contained 8,561,750 tons of plant food in the ratio 1N–1·83 P_2O_5–1·036 K_2O.

World reserves of plant food are enormous when considered in the light of consumption. Inexhaustible supplies of atmospheric nitrogen can be recovered for use through legume fixation or synthetic processes. Known deposits of high-grade phosphates are estimated to contain well over 17,000,000,000 tons, sufficient to last 1,500 years at present rate of consumption with additional known lower-grade deposits sufficient for thousands of years more. Potash reserves are estimated sufficient for at least 1,000 years at present rates of consumption.

FEY, EMIL, Austrian soldier and statesman, was born in Vienna on March 23, 1886, and died on March 16, 1938. Major Fey served with distinction in the World War, and received the Maria-Theresa Order. In 1930 he was in command of the Viennese Heimwehr, and later became one of the most powerful supporters of Dr. Dollfuss, under whom he held office as a Federal Minister and State Commissioner-General for the Interior. When Dollfuss was murdered in 1934, Fey was being held prisoner by the Nazi conspirators. Fey continued in the government under Schuschnigg until Oct. 17, 1935, when he resigned, shortly afterwards being awarded the Grand Cross of the Order of Merit. In Nov. 1935 he relinquished the leadership of the Heimwehr to Prince Starhemberg, but regained it the next year. Prince Starhemberg's attack upon Fey's conduct at the murder of Dollfuss was completely rebutted in March 1937. On the dissolution of the Heimwehr, Fey's activities were brought to a close; in March 1938 he was found shot with his wife and child, being stated to have committed suicide rather than accept Germany's absorption of Austria.

FIJI. A Crown Colony of the British Empire in the western Pacific Ocean, comprising some 250 islands, of which about eighty are inhabited.

Area and Population:

Area 7,055 sq. miles.
Population (Dec. 31, 1937) 205,397 (European 4,238, Indian 89,333).
Capital, Suva (pop. 1936, 15,522).

Governor. Sir Harry C. Luke, K.C.M.G.
Production 1936-37 :

Sugar	120,692 tons	Gold	24,917 fine oz.

Public Debt . . . . . £Fiji 1,414,030
Exchange rate . . . £Fiji 125 = £ stg. 100

FINANCIAL REVIEW. World financial affairs in 1938 were marked by a series of secondary fluctuations which obscured any distinct long-term trend. The fluctuations, moreover, affected different countries at different times and in different ways. Roughly speaking, however, there were four main phases. The first phase, lasting from January to May, can be described as "bumpy weather", the general effect being one of increasing depression—an intensification of the factors operating since the fall of commodity and stock exchange prices in the middle of 1937. Then in June 1938 began a phase of recovery, persistent enough to be distinguishable from the occasional minor upward movements of the earlier months. That phase was brought to an abrupt end by international political disturbance, which began in August and reached its climax at the end of September. During this third period all ordinary economic forces became gradually subordinated to the fear of world war. The Munich settlement was followed by a resumed phase of revival in financial markets, and this phase—again with secondary variations—continued to the end of the year.

The four phases, with the exception of the first, were not very clearly reflected in the course of average commodity prices. Between Dec. 29, 1937, and May 25, 1938, the *Economist* indices of the prices of primary products in Great Britain and the United States fell respectively from 147·4 to 132·2, and from 135·3 to 121·9, that is to say, by approximately ten per cent in each country. A simultaneous rise of seven per cent in the index (*Statistique Générale*) of French wholesale prices was associated with rising internal costs and a falling external value of the franc. From that period onwards the curves of prices of primary products in Great Britain and the United States diverged. In Great Britain, the index already cited fell from 138·0 on Aug. 3 to 132·4 on Dec. 21; while between the same dates the American index fell very slightly from 127·1 to 126·5. This steadiness of American prices compared with British prices was all the more striking in that the pound meanwhile depreciated against the dollar.

On the whole, however, the latter period of the year was one of rising world prices, and they would no doubt have risen further but for the relaxation of international restriction schemes. Thus the permissible output of copper was raised on Oct. 10 from 95 per cent to 105 per cent of standard tonnages, and a week later all restriction was removed. The international rubber committee, which in September had fixed the quota for the last quarter of 1938 at 45 per cent of standard output, two months later raised the figure by five per cent for the first quarter of 1939. The position of the tin quota was complicated by the introduction in July of a scheme to accumulate a "buffer stock"; this required a special quota of ten per cent in addition to the ordinary quota of 35 per cent. These rates were continued to the end of the year, and were maintained for the first quarter of 1939. The price of tin, however, rose substantially; as no sales were made from the buffer stock, it appeared that the International Tin Committee were aiming for still higher prices.

Associated Press]
DR. FUNK, WHO SUCCEEDED DR SCHACHT AS PRESIDENT OF THE GERMAN REICHSBANK, JAN. 20, 1939

Apart from political hopes and fears in the international field, the main-spring of commodity price movements and general financial conditions in the world at large was the course of business sentiment and actualities in the United States. These themselves had an important political background. The Wall Street stock market was highly sensitive to political signals, and one of the most striking economic facts of 1938 was the way in which stock prices tended to lead rather than follow movements of trade and industry. It was also significant that in the United States the consumption goods industries recovered in advance of those producing capital goods.

A fairly favourable trend in Wall Street in the first two months of the year was followed by serious collapse in March and early April. To troubled international conditions and national political fears was added technical distrust aroused by the indictment of Mr. Richard Whitney. The defeat of the Reorganization Bill promoted by the President initiated a sharp recovery, the Dow Jones average of industrial share prices rising 5¾ points in one day. The crisis of May 21 over Czechoslovakia had little permanent effect on international stock markets, and after some weeks of indecision a definite upward movement of Wall Street prices set in during June. By the end of that month all the ground lost earlier in 1938 had been recovered. The Dow Jones index, which had stood at 110·6 on June 1, rose to 137·8 on July 6. Although the stock markets were discounting in advance an industrial revival which was slow to materialize, the gains were held or even increased until the end of August.

Meanwhile, prices on the London stock exchange had followed roughly the same curve as Wall Street, though with less volatility and with a tendency towards greater depression. This was due partly to the relative closeness of the war danger—a factor exemplified both at the time of the Austrian crisis in March and during the rising anxieties of August—and partly to the heavy burden laid on all economic activity by the finance of rearmament. The London market nevertheless showed surprising resistance to a severe British budget (*q.v.*).

Despite strong counter-efforts by the German government, a sharp collapse of prices occurred on the Berlin bourse during July and August. Anxieties over the international future no doubt enhanced the bear movement, but the chief reasons assigned at the time were the increasing burden of taxation, the widespread feeling that the peak of industrial profits (previously inflated by spending on armaments and for the Four Year Plan) had been passed, and the forced liquidation of Jewish accounts.

Throughout September all financial markets were dominated by the international crisis. Although serious falls of

stock prices were recorded in London and still more in Paris, the Wall Street market was more nervous than either. During the final week of the crisis, minimum prices for gilt-edged securities were fixed in London, and for two days they became effective The news of the Munich Conference was followed by a rush of buying on all stock markets. Later reflections were more sober, and there were a number of dull and nervous periods before the end of the year. Improved industrial news, however, was forthcoming in Great Britain and other countries, while in the United States the markets took heart from the Republican gains at the November elections But by the end of the year no great advance had been made from the platform established immediately after the September crisis.

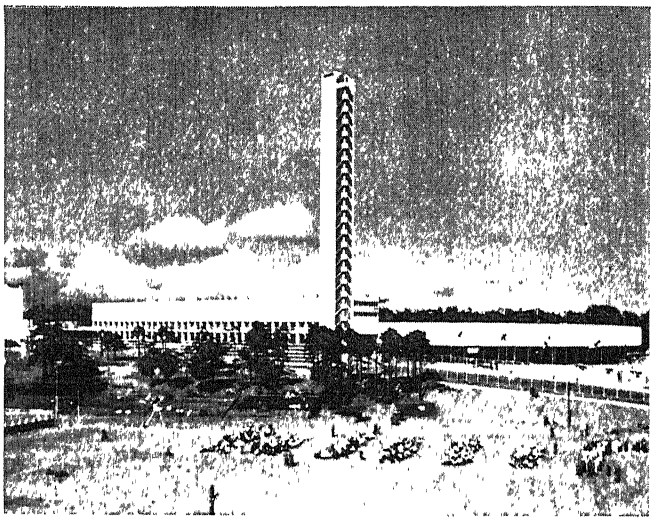
The course of bond prices was not so plainly marked. Political anxieties and the shadow of rearmament finance caused a net fall of prices of British government securities, whereas government bonds remained comparatively steady in the United States. Over the world as a whole, the year saw no significant change in the long-term rate of interest. International bond markets, however, were naturally depressed by successive political disturbances. Austrian five per cent bonds of 1930 fell from a high point of 102 to a low point of 23, though they recovered to 50 and higher before the end of the year. Chinese bonds, which were marked down heavily as Japan extended control over the ports and revenues of China, also finished the year well above their lowest point. The same is true of Czechoslovakian bonds, the eight per cent issue falling from 74 on Aug. 24 to 40 on Oct. 19, and recovering three weeks later to 63½ There were scarcely any new international issues of capital, though the British censorship on the export of new capital was relaxed in February, chiefly in favour of the repurchase of large blocks of existing securities. Under this dispensation, British control over a famous drug business was regained, and a block of shares valued at more than £6 millions in a still more famous multiple store passed from American to British hands in November. For the year, new issues on the London market for overseas countries totalled £59·4 millions (practically all for countries in the British Empire) and for home borrowers £213·7 millions, the comparable figures for 1937 being £70·5 millions and £387·5 millions. In the United States a comparative falling off of new issues for internal purposes (there being virtually none for export) during the first half of the year was offset by a comparative spate during the later months.

Short-term rates of interest remained low. The governments and central banks of the principal free-exchange countries retained a policy of " cheap money," and even the September crisis caused no reversal of this beyond a rise in the French bank-rate from two and a half per cent to three per cent on Sept. 28. In London the rate of discount on new Treasury bills temporarily rose above 10s. per cent. The international movements of money resulting from the crisis caused greater stringency than internal factors, but the central banks concerned were at pains to offset them by open-market action. Two special efforts in the direction of easy credit conditions deserve mention. In July the French government took steps to create a complete money-market in Paris. A decree authorized the Bank of France to operate in short-term treasury bills, National Defence bonds, railway bills, and first-class commercial bills ; a new discount company would also be formed. The second occasion was the enlargement of the credit base in the United States. During the first half-year some $1,400 millions of gold in the Treasury's inactive gold fund were gradually monetized, and the reserve requirements of the Federal Reserve banks were reduced by some $700 millions. In July Federal Reserve member banks were authorized to grant loans up to ten years instead of only nine months, and to hold unlisted bonds of local companies in their portfolios provided they were amortized up to 75 per cent. The acceleration of American business activity was attributed in large part to this credit expansion, coupled with expenditure under the Federal Housing Act and other New Deal measures, and the release of private capital as a result of the new Tax Act, which relieved taxes on undistributed profits and on capital gains.

In the international movement of short-term money, there were four main phases which roughly corresponded to the four phases in general financial affairs In the first half of the year the depression of business and stock market prices in the United States caused a certain withdrawal of foreign funds from that country. The total net outflow of capital in six months (including long-term capital) was $375 millions Up to late April, on the other hand, confidence in the future of France and the franc was weak, and money continued to pour out of France. The chief recipients of international short-term capital were Great Britain, the Netherlands, and Switzerland. This phase was ended with the advent of M. Daladier's government in April, followed by the revaluation of the franc, and with the upturn in American business.

When rumours of impending revaluation first began to circulate, the franc was sold down from 158 to 167 to the pound. Although the French control fund tried to intercept this movement, when the revaluation was actually announced the lower limit of the franc's permissible fluctuations was fixed at the equivalent of 179 to the pound, and this figure was soon afterwards reached on the markets. The depreciation of the franc caused considerable strain on the belga, which was unable to follow on account of its anchorage to gold, and this strain continued throughout the year.

The third phase in short-term capital movements was the brief one associated with the European crisis of August and September. But, before it began, the return of capital to France which had followed the revaluation had already been reversed. From time to time rumours of the probable devaluation of the dollar, coupled with political nervousness, had revived a flight into gold, causing large quantities of the metal to change hands in London at a premium above New York parity. But on the whole the dollar was strong. Its basic economic strength, founded on the large American credit balance of payments, was reinforced by rumours of forthcoming stabilization between the dollar and sterling at the old parity of $4·86⅔ to the pound, compared with a then existing rate of $4·90 or more. At the end of August, however, the pound crossed this historical rubicon without any special action by the authorities. Heavy operations in gold arbitrage took place, while " hot money " movements were dominated by the imminent fear of war. There were also large transfers of gold on behalf of the various exchange management funds. Between Aug. 5 and Sept. 15, gold bullion to the value of £62½ millions was exported from the United Kingdom ; most of it went to the United States, but it included significant withdrawals for Sweden, Switzerland, and the Netherlands. In the following three weeks, ended Oct. 6, gold exports exceeded £86 millions. To the other chief importers were now added Canada and Ireland. Over the whole period of two months, countervailing purchases of gold by the United Kingdom totalled £62 millions, the chief non-producing suppliers being Belgium



and France Between Aug 11 and Oct 6 the monetary gold stock of the United States rose by $779 millions, this being roughly equivalent to Europe's losses From January to July, American imports of gold had totalled $306 millions.

The losses of gold from the British exchange equalization account during the September crisis considerably depleted its resources On March 31, 1938, however, its holdings of gold had totalled nearly £298 millions, in addition to £537 millions in the Bank of England. By Sept. 30 they had fallen to £152 millions Early in the new year the Bank sold to the account £200 millions of gold, worth approximately £350 millions at current market valuation Meanwhile the pound had been allowed to depreciate against the dollar On the morrow of the Czechoslovakian crisis (Oct. 1), the London rate on New York was $4·82¼, but at the end of the year the rate was only $4·66. The fall of sterling against the dollar gave support to the franc against the pound, and the London-Paris rate of exchange at the end of the year was 177·10 francs to the pound. The franc, however, had also been helped considerably by the defeat of the general strike early in December and by the acceptance of M. Reynaud's plan of financial and economic reforms. This plan included the raising of 8¾ milliards of francs by new taxation, economies to a total of five milliards, the virtual abandonment of the compulsory forty-hour week, and the use of profits on revaluation of the gold reserves to reduce the advances of the Bank of France to the state. Thus once more the year evinced its characteristic of the dominance of political forces in financial affairs. (H. V. H.)

FINLAND. A seven-year defence programme, to cost £12 millions, introduced in March, was adopted in May by the Diet, an increase of twenty per cent in income-tax being imposed. As one consequence, members of the Diet of the Åland Islands were summoned to Helsingfors in October to discuss steps for their defence, including revision of the clause exempting the islanders from military service, a matter in which Sweden was also involved. In November the Foreign Minister, Dr. Rudolf Holsti (who had visited London in July on his way from the United States), resigned, giving reasons of health and finance, though it was rumoured that his friendships with Britain, France, and U.S.A. had been distasteful in Germany; he was succeeded by M. Eljas Erkko. The world's skiing championships were held at Lahti in February. On May 16 the twentieth anniversary of Finland's independence was celebrated at Helsingfors by a trooping of the colours. (H. Fw.)

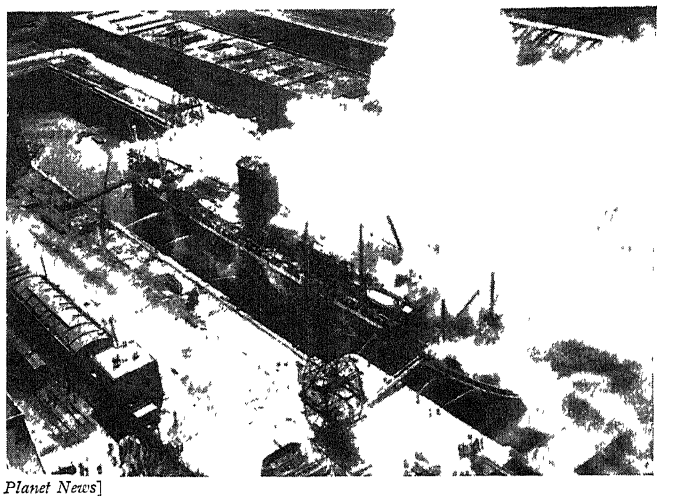
FINNISH LITERATURE. Of living authors mentioned in the *Ency. Brit.* (vol. 9, p. 256), only very few have contributed to the literary output of 1938. In Finnish prose the younger authors are now predominating, with names that were scarcely known a few years ago. Most important in this generation is Toivo Pekkanen (*b.* 1902), who has published a fine collection of stories, *Levottomuus* ("Unrest"). Olavi Paavolainen (*b.* 1903) has published a collection of essays, *Risto ja hakaristi* ("The Cross and the Swastika"), which contains studies of modern Germany and of ancient South America. His work is on the borderline between literature and journalism, but as journalism it is brilliant.

Of the older poets Otto Manninen has published a new volume, *Matkamies* ("The Traveller"), which will for ever maintain its place among the great books of Finnish poetry, An eminent critic, Lauri Viljanen (*b.* 1900), has with his poems, *Näköala vuorelta* ("Views from the mountain"), conquered a place among the foremost of the poets in Finnish. Mr. Viljanen had in 1936 published a volume of essays, the



title of which, *Taisteleva humanismi* ("Humanism in Battle"), was a programme, and in 1935 he wrote a book on the poet V. A Koskenniemi A book which will probably live long is the *Kootut Runot* ("Collected Poems") of Saima Harmaja It contains the published posthumous poems of a young girl who in 1937 died of tuberculosis at the age of twenty-four She was a precocious, highly gifted poet, who fulfilled in rich measure the promises she had given when publishing her first volume at the age of nineteen.

Books in Swedish. Among poets writing in Swedish are to be mentioned Elmer Diktonius (*b* 1896), who this year has published his sixth volume of poems *Jordisk ömhet* ("Earthly Tenderness"), and Emil Zilliacus, whose book has the title of *Vandringen* ("The Excursion"). The form is as perfect as in the earlier poems of Zilliacus, and the content expressed is characterized by the same high seriousness Among Swedish prose books, Mrs Ester Ståhlberg's (*b.* 1870) *Mathilda Wredes testamente* ("The Testament of Mathilda Wrede") ought to interest readers outside Finland The book describes, in the form of a novel, the evolution which led Mathilda Wrede, the friend and protectress of prisoners, to adopt the humanitarian life-work which has made her famous Stress is laid on the influence exercised on her by English preachers and moralists Dr. Hans Ruin (*b.* 1891), the author of a profound book on the mysticism of poetry (1935), published in 1938 a collection of essays with the title *Val mött, Europa* ("A Salute to Europe"). The book contains, among other things, a brilliant description of the P.E.N. congress at Buenos Aires (Y. H.)

FIRE INSURANCE. In spite of the unsettled state of the political arena, 1938 was generally satisfactory for the fire insurance companies Apart from those due to warlike operations in Spain and China the most disastrous fires during the year were one at Los Angeles, California, in November, destroying a hotel and a large number of dwellings, one at an electrical engineer's store at Witton, with £560,000 damage, and one which commenced in a large department store in Marseilles, France, on Oct. 28–29, spreading to a large hotel and several surrounding buildings, the total damage there being in the region of £300,000.

Certain classes of property are notoriously liable to fire losses, as for example, country mansions in the United Kingdom. Fires such as those referred to attract the attention of the public. It is not the spectacular fires, however, that are responsible for the major portion of the insurance companies' claims. The United States Board of Fire Underwriters publishes an annual survey of fires in the United States, which provides much useful information. The report for the year 1937 shows that 620,000 fires occurred, involving a total of about £54 millions. Of these, 379,000 fires causing damage of £18,500,000, an average of £49 per fire, were in respect of private dwellings. Saw-mills and other woodworkers' premises on the other hand, accounted for only £1 million, that is, an average of £625 per fire for the 1,600 fires concerned.

Fire waste is a serious drain on a country's resources, being a direct destruction of the nation's wealth. With a view to reducing this waste, the Fire Brigades Act, 1938, was passed in Great Britain during the year, with the object of consolidating the fire brigade service and ensuring that local authorities for every district should provide efficient brigade protection. In the past, many districts had relied upon volunteer brigades, some of which reached quite a high level of efficiency.

Planet News]
THE FRENCH LINER, "LAFAYETTE", BURNING AT LE HAVRE, MAY 5, 1938, AFTER HER OIL TANKS HAD CAUGHT FIRE

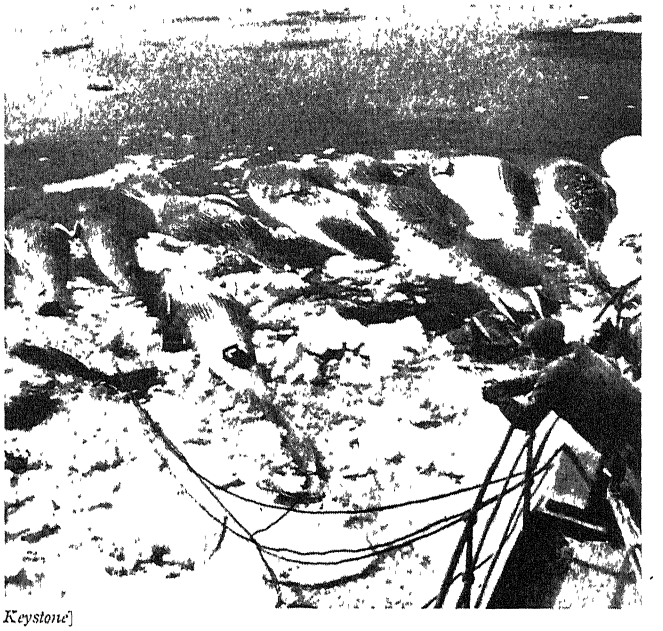
The average annual fire loss per head varies in different countries, being dependent upon many factors. In the United Kingdom, where buildings are mostly of brick or stone with slated or tiled roofs, and few populous districts have been without the protection of some trained fire brigade, the average loss per head of the population for a number of years has approximated 4*s.* per annum. In the United States of America, timber enters more into the external construction of many buildings, especially in the country districts, and in those districts, too, fire brigade protection is not so generally available. These facts are reflected in the annual loss ratio in that country of about 8*s.* 6*d.* per head per annum

Legislation was introduced in various countries during the year to regulate and control in one way or another the operations of the insurance companies. No objection can be taken to any government endeavouring to protect the interests of its own subjects, and in fact any measure which results in the real protection of the insured is welcomed by the majority of the companies. It is, however, becoming increasingly the practice of governments to require deposits to be lodged for the benefit of policy holders in the country concerned, and whilst this undoubtedly results in the exclusion of companies of insufficient capital, the same effect could be obtained in other ways. The deposits themselves, representing a very small proportion of a company's liabilities, would have little material effect in case of insolvency due to abnormal losses or inefficient underwriting. One serious loss might exceed the deposits of many companies, and the tying up of funds in this way, restricting the company from obtaining the full advantage of its reserves where they may be required, may tend to have an embarrassing effect quite different from that intended, which might not be apparent from the published accounts and thus defeat its own ends. (S. A. M.)

FIRESTONE, HARVEY SAMUEL, American industrialist, was born in Ohio on Dec. 21, 1868, and died at Miami, Florida, on Feb. 7, 1938. In 1896 he founded the Firestone Rubber Company in Chicago, and, after the advent of the motor-car, established at Akron in 1900 the Firestone Tyre & Rubber Company, of which he was president from 1902 to 1932 Many other rubber articles besides tyres were manufactured by this company. Firestone took a leading part in the organization and financing of rubber plantations in South America, the Philippines, and Liberia. He was the author of *Rubber, Its History*

and Development, 1922, and (with Samuel Crowther) *Men and Rubber*, 1926.

FISHERIES. The fisheries of the world, according to the latest tabulations compiled by the United States Bureau of Fisheries, annually yield about 16,800,000 tons of 2,000 lb. each, of food or products used in the arts and industries, with a value of about £148,800,000. Of this amount, the fisheries conducted in the north Atlantic area by bordering countries produce about 7,300,000 tons, valued at £76,600,000, with the production by eastern north Atlantic countries amounting to 5,900,000 tons, valued at £64,000,000 and by western north Atlantic countries to 1,400,000 tons, valued at £12,000,000.



The species of importance taken in the north Atlantic area are herring, cod, haddock, mackerel, halibut, swordfish, crabs, shrimp, and oysters. During 1938, a fishery for tuna, of various kinds, was begun in a commercial way off the north Atlantic coast of the United States. As in 1937, when a convention was signed on behalf of the governments of Belgium, Denmark, Germany, Great Britain, Iceland, the Irish Free State, the Netherlands, Norway, Poland, and Sweden, the decline in certain species through over-fishing and other causes is causing concern This convention, among other things, regulates the size of the meshes of otter trawls and seine nets fished from vessels of the signatory countries in certain waters of the eastern Atlantic. It is hoped that through regulations under this convention, which are under consideration by some of the signatory powers, the fish population on the grounds of the eastern North Atlantic, especially in the North Sea, will be replenished.

Great Britain. In Great Britain the plight of the herring industry was a major issue in the Fisheries industry. The report of the Herring Industry Board for the year ended March 31, 1938, pointed out that trading conditions were even less favourable than in the two previous years. The total catch in 1937 was 1,511,610 crans, compared with 1,533,526 in 1936; but even more serious was a reduction in value of 9 per cent. Exports to European countries have dropped from 1,100,000 bbls. to 540,000, and the report states that "There are no grounds for expecting the recovery of a trade in herrings even comparable in amount with that of former days."

A bill to amend the Herring Industry Act of 1935, introduced on May 12, provided for the reconstruction of the Herring Industry Board on the termination of the office of the present Board next November, and a Herring Industry Advisory Council was set up.

North America. On the western north Atlantic, depleted stocks have also caused concern. Fishing vessels are obliged to travel farther from the home port, and large and more modern vessels of the otter trawl type are being constructed. In an effort to replenish the haddock fisheries, especially on Georges Bank, many of the trawlers fishing for haddock and cod are now using the mesh of larger size. The North American Council on Fishery Investigations hopes that this voluntary compact on the part of the industry will be made permanent by some form of international agreement between the countries prosecuting the haddock fishery of the western north Atlantic.

In Newfoundland, the plight of the fishers was given further study in 1938, and measures were promulgated to improve their welfare. This consisted mainly of government provision for outfitting the fishermen and in taking steps to improve methods for the curing and marketing of fish Some inducements also were made by Newfoundland to attract fishery concerns from the United States to conduct operations on the Treaty coast.

Keystone]
A CATCH OF WHALES AT THE STERN OF A FACTORY SHIP

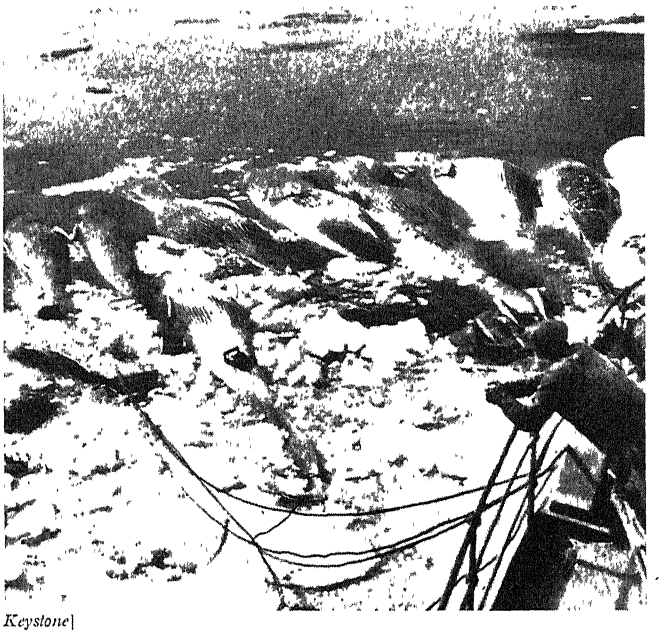
In the Maritime Provinces of Canada, further progress was made during 1938 in the formation and operation of co-operative associations of fishermen.

Whaling. Norway and Great Britain are the two nations most vigorously prosecuting the whale fisheries. Operations have centred almost entirely in the Antarctic, where the take in recent years has been enormous; for instance, during the period from the season of 1919–20 to the 1936–37 season, inclusive, 337,313 whales were captured in the Antarctic, from which 26,580,796 bbls. of oil have been produced, according to Reports X (1937) and XI (1938) of the Committee for Whaling Statistics, Oslo. One barrel of about 50 gal equals one-sixth ton. One ton equals 1,016 kg. or 2,240 lb. From the same reports we find that during the 1936–37 season alone 34,579 whales were captured in the Antarctic fishery, from which 2,658,108 bbls. of oil were produced. Norwegian whaling accounted for 15,039 whales, with an oil production of 1,158,665 bbls.; British whaling accounted for 12,361 whales, with an oil production of 977,822 bbls.; and the whaling of other countries in this area accounted for 7,179 whales, with an oil production of 521,621 bbls. During this season, 9,321 men took part in the Antarctic whale fishery, of whom 7,678 were Norwegians, 837 Japanese, 454 British, and 255 German.

In view of this intensive prosecution, protective measures against extermination were taken at the International Convention between 26 powers which became effective in 1935. An international agreement for the further regulation of whaling was signed in London on June 8, 1937, on behalf of the Argentine Republic, Commonwealth of Australia, Germany, the Irish Free State, New Zealand, Norway, the Union of South Africa, the United Kingdom of Great Britain and Northern Ireland, and the United States of America. This is now in force. This agreement was further amended to restrict whaling, at a meeting in London on June 24, 1938. At this time a protocol was adopted to the London agreement by twelve signatory powers. This is not yet in effect.

and Development, 1922, and (with Samuel Crowther) *Men and Rubber*, 1926.

FISHERIES. The fisheries of the world, according to the latest tabulations compiled by the United States Bureau of Fisheries, annually yield about 16,800,000 tons of 2,000 lb. each, of food or products used in the arts and industries, with a value of about £118,800,000. Of this amount, the fisheries conducted in the north Atlantic area by bordering countries produce about 7,300,000 tons, valued at £76,000,000, with the production by eastern north Atlantic countries amounting to 5,900,000 tons, valued at £64,000,000 and by western north Atlantic countries to 1,400,000 tons, valued at £12,000,000.



The species of importance taken in the north Atlantic area are herring, cod, haddock, mackerel, halibut, swordfish, crabs, shrimp, and oysters. During 1938, a fishery for tuna, of various kinds, was begun in a commercial way off the north Atlantic coast of the United States. As in 1937, when a convention was signed on behalf of the governments of Belgium, Denmark, Germany, Great Britain, Iceland, the Irish Free State, the Netherlands, Norway, Poland, and Sweden, the decline in certain species through over-fishing and other causes is causing concern. This convention, among other things, regulates the size of the meshes of otter trawls and seine nets fished from vessels of the signatory countries in certain waters of the eastern Atlantic. It is hoped that through regulations under this convention, which are under consideration by some of the signatory powers, the fish population on the grounds of the eastern North Atlantic, especially in the North Sea, will be replenished.

Great Britain. In Great Britain the plight of the herring industry was a major issue in the Fisheries industry. The report of the Herring Industry Board for the year ended March 31, 1938, pointed out that trading conditions were even less favourable than in the two previous years. The total catch in 1937 was 1,511,610 crans, compared with 1,533,526 in 1936; but even more serious was a reduction in value of 9 per cent. Exports to European countries have dropped from 1,100,000 bbls. to 540,000, and the report states that "There are no grounds for expecting the recovery of a trade in herrings even comparable in amount with that of former days."

A bill to amend the Herring Industry Act of 1935, introduced on May 12, provided for the reconstruction of the Herring Industry Board on the termination of the office of the present Board next November, and a Herring Industry Advisory Council was set up.

North America. On the western north Atlantic, depleted stocks have also caused concern. Fishing vessels are obliged to travel farther from the home port, and large and more modern vessels of the otter trawl type are being constructed. In an effort to replenish the haddock fisheries, especially on Georges Bank, many of the trawlers fishing for haddock and cod are now using the mesh of larger size. The North American Council on Fishery Investigations hopes that this voluntary compact on the part of the industry will be made permanent by some form of international agreement between the countries prosecuting the haddock fishery of the western north Atlantic.

In Newfoundland, the plight of the fishers was given further study in 1938, and measures were promulgated to improve their welfare. This consisted mainly of government provision for outfitting the fishermen and in taking steps to improve methods for the curing and marketing of fish. Some inducements also were made by Newfoundland to attract fishery concerns from the United States to conduct operations on the Treaty coast.

Keystone

A CATCH OF WHALES AT THE STERN OF A FACTORY SHIP

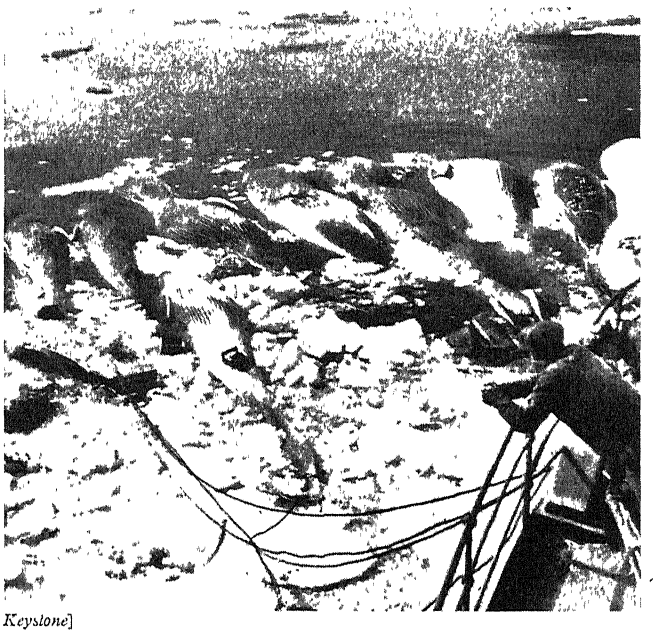
In the Maritime Provinces of Canada, further progress was made during 1938 in the formation and operation of co-operative associations of fishermen.

Whaling. Norway and Great Britain are the two nations most vigorously prosecuting the whale fisheries. Operations have centred almost entirely in the Antarctic, where the take in recent years has been enormous, for instance, during the period from the season of 1919–20 to the 1936–37 season, inclusive, 337,313 whales were captured in the Antarctic, from which 26,580,796 bbls. of oil have been produced, according to Reports X (1937) and XI (1938) of the Committee for Whaling Statistics, Oslo. One barrel of about 50 gal. equals one-sixth ton. One ton equals 1,016 kg. or 2,240 lb. From the same reports we find that during the 1936–37 season alone 34,579 whales were captured in the Antarctic fishery, from which 2,658,108 bbls. of oil were produced. Norwegian whaling accounted for 15,039 whales, with an oil production of 1,158,665 bbls.; British whaling accounted for 12,361 whales, with an oil production of 977,822 bbls.; and the whaling of other countries in this area accounted for 7,179 whales, with an oil production of 521,621 bbls. During this season, 9,321 men took part in the Antarctic whale fishery, of whom 7,678 were Norwegians, 837 Japanese, 454 British, and 255 German.

In view of this intensive prosecution, protective measures against extermination were taken at the International Convention between 26 powers which became effective in 1935. An international agreement for the further regulation of whaling was signed in London on June 8, 1937, on behalf of the Argentine Republic, Commonwealth of Australia, Germany, the Irish Free State, New Zealand, Norway, the Union of South Africa, the United Kingdom of Great Britain and Northern Ireland, and the United States of America. This is now in force. This agreement was further amended to restrict whaling, at a meeting in London on June 24, 1938. At this time a protocol was adopted to the London agreement by twelve signatory powers. This is not yet in effect.

and Development, 1922, and (with Samuel Crowther) *Men and Rubber*, 1926.

FISHERIES. The fisheries of the world, according to the latest tabulations compiled by the United States Bureau of Fisheries, annually yield about 16,800,000 tons of 2,000 lb. each, of food or products used in the arts and industries, with a value of about £148,800,000. Of this amount, the fisheries conducted in the north Atlantic area by bordering countries produce about 7,300,000 tons, valued at £76,600,000, with the production by eastern north Atlantic countries amounting to 5,900,000 tons, valued at £61,600,000 and by western north Atlantic countries to 1,400,000 tons, valued at £12,000,000.



The species of importance taken in the north Atlantic area are herring, cod, haddock, mackerel, halibut, swordfish, crabs, shrimp, and oysters. During 1938, a fishery for tuna, of various kinds, was begun in a commercial way off the north Atlantic coast of the United States. As in 1937, when a convention was signed on behalf of the governments of Belgium, Denmark, Germany, Great Britain, Iceland, the Irish Free State, the Netherlands, Norway, Poland, and Sweden, the decline in certain species through over-fishing and other causes is causing concern. This convention, among other things, regulates the size of the meshes of otter trawls and seine nets fished from vessels of the signatory countries in certain waters of the eastern Atlantic. It is hoped that through regulations under this convention, which are under consideration by some of the signatory powers, the fish population on the grounds of the eastern North Atlantic, especially in the North Sea, will be replenished.

Great Britain. In Great Britain the plight of the herring industry was a major issue in the Fisheries industry. The report of the Herring Industry Board for the year ended March 31, 1938, pointed out that trading conditions were even less favourable than in the two previous years. The total catch in 1937 was 1,511,610 crans, compared with 1,533,526 in 1936; but even more serious was a reduction in value of 9 per cent. Exports to European countries have dropped from 1,100,000 bbls. to 540,000, and the report states that "There are no grounds for expecting the recovery of a trade in herrings even comparable in amount with that of former days."

A bill to amend the Herring Industry Act of 1935, introduced on May 12, provided for the reconstruction of the Herring Industry Board on the termination of the office of the present Board next November, and a Herring Industry Advisory Council was set up.

North America. On the western north Atlantic, depleted stocks have also caused concern. Fishing vessels are obliged to travel farther from the home port, and large and more modern vessels of the otter trawl type are being constructed. In an effort to replenish the haddock fisheries, especially on Georges Bank, many of the trawlers fishing for haddock and cod are now using the mesh of larger size. The North American Council on Fishery Investigations hopes that this voluntary compact on the part of the industry will be made permanent by some form of international agreement between the countries prosecuting the haddock fishery of the western north Atlantic.

In Newfoundland, the plight of the fishers was given further study in 1938, and measures were promulgated to improve their welfare. This consisted mainly of government provision for outfitting the fishermen and in taking steps to improve methods for the curing and marketing of fish. Some inducements also were made by Newfoundland to attract fishery concerns from the United States to conduct operations on the Treaty coast.

During this season, 9,321 men took part in the Antarctic whale fishery, of whom 7,678 were Norwegians, 837 Japanese, 454 British, and 255 German.

In view of this intensive prosecution, protective measures against extermination were taken at the International Convention between 26 powers which became effective in 1935. An international agreement for the further regulation of whaling was signed in London on June 8, 1937, on behalf of the Argentine Republic, Commonwealth of Australia, Germany, the Irish Free State, New Zealand, Norway, the Union of South Africa, the United Kingdom of Great Britain and Northern Ireland, and the United States of America. This is now in force. This agreement was further amended to restrict whaling, at a meeting in London on June 24, 1938. At this time a protocol was adopted to the London agreement by twelve signatory powers. This is not yet in effect.

FLAX AND LINEN. Nineteen hundred and thirty-eight was a difficult year which witnessed further changes in the linen map of Europe and a marked decline in (fibre) flax growing in the U S S.R., Estonia, and Lithuania. The annexation of the Sudeten textile regions added considerably to the capacity of the German linen industry. Practically all the important flax spinning mills and linen weaving factories in Bohemia, with the exception of those in Dvur Kralové and Upice, were ceded to the Reich. Czechoslovakia thus lost most of the linen inheritance which she had gained twenty years before at the expense of the Austro-Hungarian dual monarchy Germany's internal consumption of flax has now attained considerable proportions due largely to her re-armament programme, and Greater Germany is a force to be reckoned with in the continental flax markets as the Reich, despite intensive efforts, is unable to grow sufficient flax at home to feed her own mills, let alone those in Sudetenland.

The scarcity and high prices of standard grades of flax and tow, consequent upon the Soviet policy of restricting fibre exports, caused grave concern to spinners during the year and also to weavers who found it difficult, if not impossible, to purchase yarns of consistent quality and strength. On the last working day of 1938, the Soviet Flax Monopoly announced that it had decided not to sell any scutched flax, dressed line, and Ralo or peasant tows from its 1938 crop. This decision will inevitably affect adversely the linen industry of every country by stimulating the prices of substitute flaxes and increasing the gap between competitive prices of linen and cotton materials.

The first real attempt to restore flax to the rotation of the British farmer, with Northern Ireland as an experimental base, was made in 1938 The Ulster government granted £150,000 (spread over three years) to stimulate home flax production, and efforts are also being made to encourage flax production in Kenya, Canada, and Australia. Further progress was made during 1938 in mechanizing growing and decortication, and soon medium- and low-grade flax will be spun in its natural (unretted) state, thus absolving the grower from the distasteful task of retting Belgium is now the foremost flax exporting nation, and Flemish fibre worth over £3 millions was exported in 1938.

Further progress was made in 1938 in designing improved linen machinery, the greatest success being achieved in the spinning section of the trade. The double-crank pushbar drawing system has been adopted as standard equipment in the tow department, and the principle is now being applied to line. Intensive efforts are being made to speed up the wet spinning frame, and interesting automatic-doffing flyer and wet ring frames have been evolved.

Remarkable linen tariff concessions were granted in 1938 by the U.S.A., the world's largest market for flax products. Following upon the United States–Czechoslovakian trade pact in April, the Anglo-American trade agreement which came into force on Jan. 1, 1939, drastically cut U.S.A. linen duties, particularly on the medium and finer qualities. In theory all linen-exporting countries (save Germany, Sudetenland, and Austria) will gain equally with the United Kingdom under the most favoured nation clause, but in practice Northern Ireland will benefit most as Ulster specializes in those better-grade fabrics on which the tariff reductions were heaviest. Thus rates on fine damasks were reduced by fifteen per cent, whilst coarse crashes, towellings, etc. benefited only by a meagre five per cent concession. U.S.A. linen consumption has been shrinking steadily for years past, due partially to the industrial depression allied with the growing popularity of rayon and staple fibre. This challenge was taken up by the (U.S.A.) Linen Trade Association which launched an ambitious campaign in August to make the public "linen conscious". Britain is linen exporter-in-chief to the transatlantic market and it is noteworthy that United States imports of British linen piece-goods dropped from £1,554,381 in 1937 to £681,077 in 1938. Exports from Belgium and other continental linen sources declined similarly. Exports of linen goods from the United Kingdom in 1938 (including a small percentage of soft hemp goods) totalled £5,480,274 as against £7,789,092 in 1937, due largely to poor purchasing on the part of U.S.A. and China China is normally a large purchaser of fine Ulster linen cambrics and sheers which she embroiders for the transatlantic market, but the Sino-Japanese dispute has put a brake on this triangular trading Furthermore, the metal duralumin and other light alloys are tending to supersede flax fabric as a wing material for aeroplanes. At the same time, most of the aeroplanes being constructed to-day for re-armament purposes still have their main planes, fuselages, and tail units covered with unbleached linen, and the control surfaces of many of the latest "all-metal" war aircraft are linen covered. (C. R. C.)

FLETCHER, CONSTANCE, novelist and dramatist, who wrote under the name of "George Fleming", was born in the U.S.A. in 1858, and died in Venice on June 6, 1938. Her novels included *A Nile Novel*, 1877; *Mirage*, 1878; *The Head of Medusa*, 1880; *Vestigia*, 1882; *Andromeda*, 1885, *The Truth about Clement Ker*, 1889; *For Plain Women Only*, 1895; and a collection of short stories, *Little Stories about Women*, 1897. Her work as a dramatist was represented by *Mrs Lessingham*, 1894; *The Canary*, 1899; and a dramatization of Kipling's *The Light that Failed*, 1903.

FLEURIAU, AIMÉ JOSEPH DE, French diplomatist, was born at La Rochelle on Jan 24, 1870, and died at Ismailia, Egypt, on Jan 19, 1938 He entered the French diplomatic service in 1895, was Minister in China, 1921–24, and as Ambassador in London, 1924–33, showed conspicuous tact at a time when Anglo-French relations were apt to become strained. He was created a G.C.V.O. in 1921, and a G.C.B. in 1933. He published in 1911 *L'Activité Réfléchie*.

FLOODS: *see* IRRIGATION AND FLOOD CONTROL.

FLOUR AND FLOUR MILLING. Generally speaking, during 1937 and 1938 flours of uniformly good quality have been the rule rather than the exception. Protein quality as well as quantity has been good, resulting in bread flour of broad fermentation tolerance, and more intelligent control of wheat as well as flour-blending operations has manifested itself in uniformity of quality characteristics, especially with regard to diastatic strength In many of the better mill laboratories, carefully controlled baking tests have supplemented the usual moisture, ash, and protein determinations, while an increasing number of mill chemists have adopted standards of diastatic power to round out their regulation of quality factors.

One of the most outstanding recent accomplishments of chemical research as applied to cereal products has been the development of molecular distillation of wheat germ oil for the purpose of separating its valuable vitamin constituent from the various glycerol esters, phosphatides, and other saponifiable matter of the crude wheat oil. This development presents great possibilities for the fractionation of other cereal oils into products of potential biological value.

Milling Practice. Air conditioning, a technology which was undoubtedly born in the milling industry, is becoming

recognized as a valuable asset to good mill control From the first break rolls through to the warehouse a careful control of humidity as well as of temperature is regarded as superior milling practice. To eliminate static electricity as a fire hazard, the maintenance of a relative humidity of above fifty degrees is a condition worth achieving it only for its safety value

Grain washing has come into its own in the better mills. As a means of securing a better temper as well as a cleaner break flour, washing has been a credit operation to those millers who practise it. But like the tempering process, if not an important conditioning function in itself, grain washing must be carefully controlled

In mill engineering the installation of successful battery rolls has aroused considerable interest and comment Milling units of medium size of from about 300 to 600 barrels daily capacity seem well suited to the battery arrangement. Satisfactory flexible couplings, together with better chain drives, have contributed to the success of multiple roll operation. With the elimination of much line shafting, pulleys, and belting, there are certain definite advantages, particularly the opportunity to set other machinery directly beneath the rolls, thus eliminating considerable spouting, saving space, and permitting a reduction in the amount of elevating equipment

FLOWERS AND FLOWER FARMING: *see* HORTICULTURE.

FOOD AND DRUG LEGISLATION. The Food and Drugs Act, passed in July, 1938, was the outcome of a departmental committee set up by Mr. Greenwood, when Minister of Health in the Labour government of 1929–31; it is a consolidation Act, some 250 provisions contained in over 36 Acts dating from the reign of Henry VIII being replaced by this single measure of 103 sections, in which the very minimum of new matter is introduced.

Its range is extensive, dealing as it does with the preparation, advertising, and sale of food of all kinds—from bread and milk, artificial cream and ice-cream, to horseflesh and shell-fish—as well as with drugs; and of its new provisions the following are the most important in their bearing on the general public.

A new offence has been created in the *possession* of any food or drug to which a substance (including colourings, flavourings, condiments, etc.) that will render it injurious to health or will impair its quality has been added; previously the law limited the offence to the *sale* of such.

The proviso in the 1928 Act that a person should not be convicted if he did not know, and could not with reasonable diligence have ascertained, the condition of the food or drug has been omitted.

The power to make regulations to prescribe the composition of food, given by the Public Health Act, 1907, has been retained, and it is now made an offence to abstract any constituent of a food so as to affect it injuriously with intent to sell it in its altered form if it then infringes any regulations regarding its composition. No regulations have up to now been made in respect of ordinary foodstuffs, though for many years—under other Acts—standards have been in force for milk and milk products.

Additional safeguards are made compulsory in regard to the cleanliness and sanitation of factories, food-rooms, shops, etc., and local authorities are given increased power to control open-air markets and stalls; the manner of making regulations controlling dairies and milk-production has been simplified; the various Bread Acts, dating from 1832, have been codified, and now the mere *presence* in bakehouses or mills of prohibited substances (as apart from *use* or *sale*) is an offence; the licences of all slaughter-houses and knackers' yards are now granted annually, for one year only, and at the discretion of the local authorities, and, finally, it is provided that the food and drug authorities shall be, generally speaking, the county and borough councils (L. H. D.)

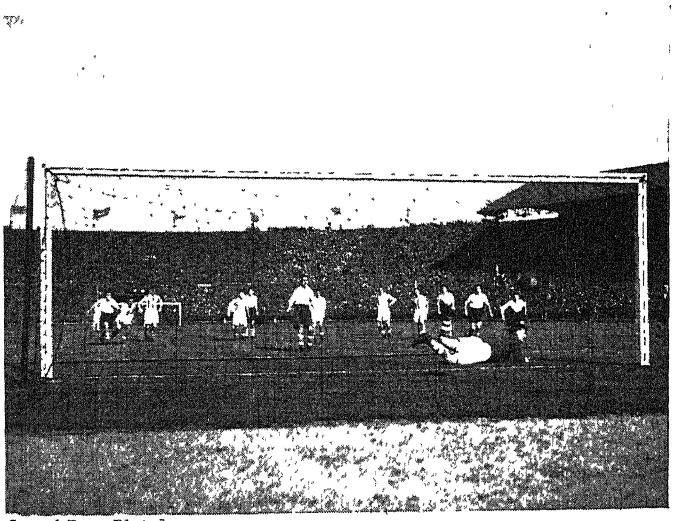
In the United States, the new Federal Food, Drug, and Cosmetics Act covers a wide field In its principal differences from the old law it brings all cosmetics except toilet soap under control, outlaws cosmetics which may be injurious to users except poisonous coal-tar hair dyes which bear warning labels, and prohibits false or misleading labelling It prohibits traffic in food which may be injurious to health; prohibits also the addition of poison to food except where such addition is required in the production thereof or cannot be avoided by good manufacturing practice, in which case tolerances are authorized limiting the amount to a point ensuring protection of public health It specifically requires label declaration of artificial colouring, artificial flavouring, and chemical preservatives in food but exempts butter, cheese, and ice-cream from this requirement in so far as artificial colouring is concerned It requires labelling of special dietary food to inform purchasers fully of its vitamin, mineral, and other dietary properties. It prohibits traffic in new drugs unless such drugs have been adequately tested to show that they are safe for use under the conditions prescribed in their labelling An exception is made of drugs intended solely for investigational use by qualified scientific experts.

The Act further requires the labelling of drugs and devices to bear warnings against probable misuse which may be dangerous to health. It requires that antiseptics possess germicidal power; that the labels of non-official drugs list the names of the active ingredients, and in addition show the quantity or proportion of certain specified substances. It also proscribes the use of containers for food, drugs, and cosmetics which may render the contents injurious to health.

FOOD PRICES: *see* PRICES, STATISTICS OF.

FOOTBALL. Under this head are reviewed the most important forms of football as played in Europe and the American continent during 1938.

Rugby Union. The year 1938 saw the death of some very famous Rugby Union football players. Canon R. D. Budworth (Oxford and England), Dr. F. E. Chapman (Durham and England), J. E. Crabbie (Oxford and Scotland), and C. P. Wilson (Cambridge and England) are just some of them.



To most people's surprise, and especially that of Scottish folk, Scotland won the international championship in 1938, and won it gloriously, scoring 52 points as against 36, and winning all three matches. When the Scottish side to play Wales at Edinburgh was announced (and the side remained practically unchanged all through the season), it was greeted in most circles as one of the weakest that had represented that country for years. R. W. Shaw was captain, and the selectors decided to play him at outside half. Now for years Scotland had been divided into two Rugby camps—those who thought Shaw an ideal outside half, and those who considered him a bad player in that position, though a good wing. The selectors were right,

for Shaw's brilliance more than anything else won Scotland the championship. A narrow and rather lucky win by eight points to six enabled them to beat Wales. Then came a much more comfortable win over Ireland by twenty-three points to fourteen, and the stage was now set for the Calcutta Cup match against England at Twickenham Not for years has such beautiful football been played in this (or any other) match as Scotland played that day. Those who saw it will for certain cherish the memory of it Shaw was superb, and the delightful try that he scored " on his own " in the last few minutes was a fitting conclusion to a real " Shaw " season The score was 21 points to 16, though in fairness to Scotland it ought to be stated that they scored five tries to England's one Others who contributed substantially to Scotland's success were R C. S Dick, J. G S Forrest, and D J Macrae (all three-quarters), and Sub-Lieut W. H Crawford, a magnificent place-kick.

Wales, a disappointing side, came next to Scotland in the international table. They beat England in the opening match, but, by a mixture of bad play and bad luck, lost to Scotland, and that lost them the championship. Cliff Jones captained the side, without ever being at his real best, whilst Wilfred Wooller, who played in the second and third matches, was never anything but a shadow of his great self. The English side was a poor one The backs were dull and slow, the great weakness being at outside half and centre three-quarter. But one of the matches was an extraordinary one—that against Ireland at Dublin England won by 36 points to 14, G. W. Parker, the full back, kicking seven goals (six conversions and a penalty). England were leading by 23 points to nil at half-time, having made full use of the gale of wind they had behind them. Ireland managed to score four tries in the second half. Probably the best players on the England side through the season were J. L. Giles, the scrum half, and R. M. Marshall and H. B. Toft, two forwards. Ireland had a poor side, too, though the display of some new men against Wales at the end of the season was reassuring H. R. McKibben and J. D. Torrens showed great promise in the centre, but F. G. Moran (a superb wing three-quarter), G. J. Morgan, the scrum-half, and S. Walker were generally the mainstays of the team.

A party of 29 players, with Major B. C. Hartley as hon. manager, toured South Africa in the summer. Twenty-three matches were played, including three " Tests ". The first two " Tests " were lost, so that South Africa won the rubber, but the tourists put up a brilliant performance in the final Test at Capetown, when they won by 21 points. As usual, the British side was not thoroughly representative, famous players like R. W. Shaw, R. C. S. Dick, J. G. S. Forrest, H B Toft, W. H. Crawford, and F. G. Moran being unable to make the journey owing to business reasons. Under these circumstances, and considering how hard hit the side was by injuries and sickness, to lose only eight matches out of 23 was not at all bad. More important still, the team created a splendid impression by the open and sporting nature of the football they played. S. Walker (Ireland) was captain, and among those who played excellently all through the tour were J. L. Giles (England), C. F. Grieve (Scotland), H. Tanner (Wales), W. H. Travers (Wales), and G. E. Cromey (Ireland).

The County Championship in 1938 was won by Lancashire, thanks mainly to the brilliance of the backs, with the J. Heaton-R. H. Guest wing always prominent, and to the good " hooking " of H. B. Toft. The Royal Navy won the Inter-Services Tournament, St. Mary's the Hospitals Cup (for the fifth year in succession), and the Metropolitan Police

Central Press Photos]

PRESTON NORTH END SCORE FROM A PENALTY TO WIN THE CUP FINAL *v* HUDDERSFIELD TOWN AT WEMBLEY, APRIL 30, 1938

the popular Seven-a-side Tournament held under the auspices of the Middlesex County R U Stewart's College F.P. won the Scottish Club Championship, and University College, Dublin, the Irish Club Championship. The University Match in December was won by Cambridge by a goal and a penalty goal (8 points) to two penalty goals (6 points). Both sides were rather below the average University strength, but a superiority in attacking ability behind the scrummage enabled Cambridge to win. J G. S. Forrest was instrumental in getting the only try, though it was R. B. Bruce Lockhart who actually scored it. The goals were kicked by K. I Geddes for Cambridge and I. H. Watts for Oxford.

Rugby League. This code was as popular as ever in the North of England. There are two main competitions, the Northern Rugby League Championship, and the Challenge Cup Competition ; and probably the outstanding performance was that by Barrow who, though they won neither competition, reached the semi-final of the first and the final of the second, more by intense local enthusiasm than by really marked skill. In the Rugby League Championship, the four teams at the top of the table at the end of the season play for the championship. Hunslet, Leeds, Swinton, and Barrow, in that order, headed the table. Hunslet beat Barrow (13–7) in one semi-final, and Leeds beat Swinton (5–2) in the other. In the final Hunslet beat Leeds (8–2). The final of the Challenge Cup Competition is always played at Wembley now, and it was Salford and Barrow who faced each other there last year. Salford were the outstanding team in the competition, and though Barrow made a grand fight of it, Salford were worthy winners of the final, even though the score was only seven points to four Salford had never won the Cup before, though they had figured in the final on four previous occasions.

In the International Championship, Wales won both her matches, beating England at Bradford by seven points to six, and France at Llanelly by 18 points to 2. It was a desperate affair at Paris between England and France, England just scraping home by 17 points to 15. Lancashire won the County Championship (thus completing a " double " with their Rugby Union side), beating Yorkshire and Cumberland fairly easily. Locally, the County Cup Competitions arouse tremendous enthusiasm, and in these Leeds beat Huddersfield for the Yorkshire Cup, and

Warrington beat Barrow for the Lancashire Cup, Salford having been unexpectedly beaten in the first round by Widnes. The attendance at Leeds for the Rugby League final, when Hunslet beat Leeds, was 54,000, the highest ever recorded for this event.

Association Football. The Football League celebrated its Jubilee in May 1938, when a banquet was held in London, the guests including H.R.H. the Duke of Gloucester and Lord Derby. Life membership of the League was conferred on Mr. C. E. Sutcliffe (president of the League) and on Mr. F. W. Rinder (the senior vice-president). At the central table sat representatives of the original clubs forming the League. It was reported at this function that the laws of Association football had been entirely redrafted and rewritten for the 1938-39 season. A very famous legislator died in 1938 Mr William Pickford. For over fifty years he had worked in the interests of the game, and had always been one of the game's leading reformers. He had succeeded the late Sir William Clegg as president of the Football Association, after having been a member of the Council since 1888. Mr. Pickford was a Hampshire man. Other men famous in the game who died in 1938 were Mr. Phil Bach and that prolific goal-scorer, Steve Bloomer.

The outstanding event of the year, the F.A. Cup Final, was won by Preston North End, but only after extra time had been played against Huddersfield Town. Mutch scored the winning goal from a penalty. There was a time when Preston looked like bringing off the "coveted double" the Cup and the League Championship. But in the end they had to be content with third place in the League table, three points behind the leaders. In the League Championships, Arsenal, Aston Villa, and Millwall headed the three Divisions, and everyone was delighted to see such a famous club as the Villa go back to its proper place in Division I. But, unfortunately, an equally famous club, West Bromwich Albion, was at the bottom of Division I; and the other club to be relegated, Manchester City, had headed the table the previous season! A new-comer to the League was Ipswich Town, who displaced Gillingham in the Third Division, Southern Section.

Celtic and the Heart of Midlothian were the two clubs at the top of Division I of the Scottish League, the Rangers coming next. In the Irish League Belfast Celtic and Derry City were bracketed top. The winners of the Scottish and Irish Cups were respectively East Fife and Belfast Celtic.

England won the international tournament, with two wins and one defeat (by Scotland at Wembley by one goal to nil). Of the international matches played in 1938, England beat France (4–2), Germany (6–3), Rest of Europe (3–0), and Norway (4–0), but lost to Switzerland (1–2); while Scotland beat Holland (3–1). The Scottish League beat the Football League. England won the Amateur International tournament, beating Scotland (5–2) and Wales (8–2), and drawing with Ireland (1–1). The F.A. Amateur Cup final was won by Bromley, who beat Erith and Belvedere by one goal to nil. The University match was won by Cambridge by 5 goals to 3, and the victory was contrary to all expectation. The match was played for the first time on a Saturday, and for the first time on an amateur club's ground—that of "Dulwich Hamlet". The scorers were E. S. Washington (2), L. D. Hollins, A. F. Lindley, and K. Goodyear for Cambridge, and H. S. Seaford (2) and R. J. Sturdy for Oxford. (D. R. G.)

American Football. The foremost teams of the season, as ranked in a nation-wide poll of sports writers, were Texas Christian University, Tennessee, and Duke, which went through its regular schedule without being scored against. Oklahoma, which also won all of its games, got a high rating, and so did Southern California, Notre Dame, Carnegie Tech, Pittsburgh, Holy Cross, Cornell, Minnesota, Michigan, and Alabama. Other strong elevens were California, Fordham, Tulane, Army, Dartmouth, Villanova, Santa Clara, St Mary's, Texas Tech, and Northwestern.

Southern California, beaten by Alabama at the start of the season and again by Washington, came back strong to win the Rose Bowl nomination, beating Duke by seven to three on Jan. 2 at Pasadena The Sugar Bowl game at New Orleans was won by Texas Christian University by fifteen to seven over Carnegie Tech. Tennessee and Oklahoma played in the Orange Bowl at Miami, the game going to Tennessee at seventeen to nil, and St. Mary's defeated Texas Tech in the Cotton Bowl at Dallas, twenty to thirteen.

Sectional honours went as follows: Carnegie Tech was rated the No. 1 team of the East; the Big Ten championship was won again by Minnesota; California and Southern California shared the Pacific Coast Conference title; Texas Christian won the Southwest Conference honours, and Tennessee the Southeastern crown; Duke regained the Southern Conference title, and Oklahoma won the Big Six championship for the first time. David O'Brien, who led T.C.U.'s running and passing attack, won the Heisman Memorial Trophy as the outstanding player of the year. The scoring averages for the season were higher than usual, probably owing in part to the two new changes in the rules: (1) eliminating the penalty for a pass into the end zone prior to fourth down, and (2) bringing the ball out fifteen instead of ten yards when it crosses the sideline between the goal lines.

Canada. In Canada many features of the U.S. game have been adopted, with great stress given to the forward pass in recent years. Kicking is of greater importance in the Dominion game, but it was the running attack of the Toronto Argonauts, led brilliantly by Buster Storey, which enabled them to defeat the Winnipeg Blue Bombers, thirty to seven, and retain the senior championship of the Canadian Rugby Union. The Argonauts defeated the Sarnia Imperials to win the championship of the East; and the Blue Bombers beat the Regina Roughriders and the Calgary Bronks to qualify as the Western representatives in the Dominion final. McGill, for the first time in ten years, won the championship of the Canadian Inter-collegiate Rugby Football Union.

FOOTBALL POOLS. The legal position of football pool betting, which was removed from the scope of the Betting and Lotteries Act, 1934, by the Lords before the Commons had had an opportunity of debating it, was unchanged during 1938, questions in the House (Feb 10, *et seqq.*, and Nov. 1) being answered to the effect that, though the promoters' profit might, as stated, amount to £2 millions per annum at no risk to themselves, the Treasury was well satisfied with the income that accrued to it from these profits and, further, that it was impracticable to separate the question of pool betting from that of the off-the-course betting as a whole.

This attitude of the government was strongly criticized by the Churches generally and by many bodies of social workers as also by traders, owing to the diversion of such large "legitimate" business; but from the narrow financial aspect there is much to justify it. An investigation conducted by the British Institute of Public Opinion in the autumn went to show that 47 per cent of the population of Britain engaged in the pools, and the estimate that £50

millions (as against some £8 millions in the first year) is "invested" is probably near the mark. Taking the 6*d.* pools only, and assuming that all promoters retain only twenty per cent for expenses, etc, then, of each £100 "invested", each attempt being enclosed in a separate envelope, the Post Office takes no less than £29 8*s.*, the actual sum "invested" being £56 10*s.*, £14 2*s.* being the promoters' share. These proportions, naturally, cannot be applied to the whole £50 millions; but the figures do show that the government's "rake-off" is considerable, and, incidentally, that the "investor" of a single 6*d.* pays 8½*d.* for an "investment" of something under 5*d.* On this point it might further be noted that some coupons can be filled up in 14,000,000 ways, and that in a recent investigation extending over fifteen weeks, it was found that only 25 completely correct forecasts were given in 330,000,000 attempts.

From the following table, showing the sales of postal orders for 6*d.*, 1*s*, and 2*s.* 6*d.* during the years ending March 31, 1930 (in the pre-pool era) and the past four years, it will be seen that the slight drop in the sixpennies during 1937—due, probably, to an increase in the unit of "investments"—has been well made up, while the rise in both of the higher values is remarkable

Year ending March 31	Postal Orders		
	6*d.*	1*s.*	2*s* 6*d.*
	£	£	£
1930	20,797,000	13,024,000	11,804,000
1935	22,924,000	35,959,000	20,883,000
1936	31,804,000	46,488,000	26,201,000
1937	30,586,000	48,826,000	29,143,000
1938	32,913,000	58,867,000	35,252,000

During the year many cases arising from the pool betting business reached the law courts, a number of them on account of ingenious but fraudulent attempts to extract money from the promoters; and in May Mr. Justice Atkinson, in trying the claim (unsuccessful) of an "investor" against a promoter who denied having received the coupon, laid it down that there were no legal obligations either way, adding that the business could not be conducted except on the basis that everybody was trusting, and took the risk of accidents. (L. H. D.)

FORAGE CROPS. The prolonged drought in the first half of 1938 greatly reduced the hay crop in Great Britain In some districts however, where no first cut had been worth while, a good aftermath was gathered. The total output in recent years has been:

Great Britain

	Acreage 000 acres	Yield per acre cwt.	Production 000 tons
Seeds Hay:			
1927–36	1,883	27·8	2,624
1937	1,878	30·3	2,846
1938	1,571	24·4	1,913
Meadow Hay:			
1927–36	4,833	19·9	4,807
1937	4,859	21·6	5,248
1938	4,402	15·0	3,289

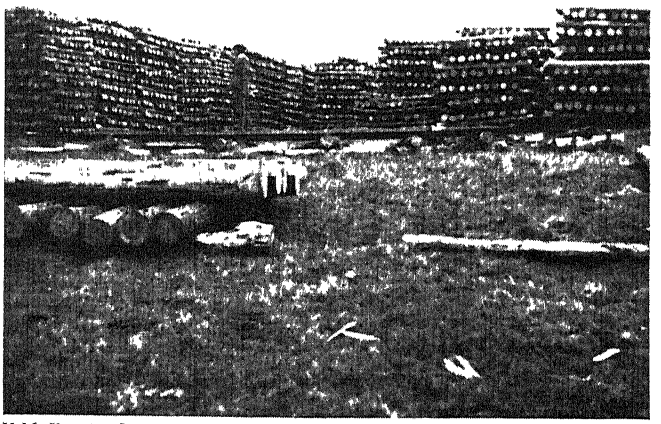
The application of lime and basic slag under the Land Fertility Scheme (*see* AGRICULTURE) is beginning to have noticeably beneficial effects. In another direction Prof. Stapledon's researches show what enormous potentialities there may be for improving the yield of grassland by seed selection and skilful management of the sward. Also, the development of grass drying has again attracted much public interest during the year. Drying outfits are becoming progressively cheaper and more efficient. Dried young grass of good quality may form a valuable concentrated food for livestock, and may compete in price with imported concentrates

In Germany hay crops were rather above the 1932–37 average and the lucerne harvest exceptionally good—thirty per cent above average. In order to develop the supply of home-grown feedingstuffs Germany has also greatly increased the area under green maize and under sweet lupins. A particularly interesting development is the widespread adoption of a winter green crop, sown immediately after the corn harvest and cut just before the potatoes are planted in May In this way a considerable acreage is made to yield two harvests instead of one. At the same time subsidies are being given for the erection of silos, both for green crops and for potatoes, for the ploughing up of pasture and for the fencing off of large meadows into small paddocks for rotational grazing.

In France the second hay crop was good though the first extremely poor. Italy also suffered from the spring drought In Canada the production of lucerne was slightly less good than in 1937, but still above the five-year average. The United States hay crop was even better than 1937 and twenty per cent above average. In the Argentine fodder crops were damaged by locusts but pastures improved during the latter months as the result of abundant rains. Both in Australia and New Zealand spring rain fell in October and November, giving a good growth of grass. (P. L. Y.)

FOREIGN MISSIONS, RELIGIOUS: For information on this subject, *see* the following articles: ANGLICAN COMMUNION, THE; BAPTIST CHURCH, THE; CONGREGATIONAL CHURCHES; METHODIST CHURCH, THE; ROMAN CATHOLIC CHURCH; and FRIENDS, THE SOCIETY OF.

FORESTRY AND REFORESTATION. Special mention may be made this year of two subjects of outstanding importance: (1) the world's future timber supplies, and (2) protective forestry.



Future Timber Supplies. The world's timber supplies are known to be diminishing rapidly. It has been estimated that the total consumption of wood is fifty per cent greater than the annual growth; and if this is correct a serious shortage of timber may be expected at no distant date. This applies more particularly to softwoods, which supply about eighty per cent of the world's requirements in sawn timber, and provide the raw material for the manufacture of wood-pulp. In the event of such a shortage, those countries which import more timber than they export will be the greatest sufferers, as their wood-using industries will be seriously affected, particularly since exporting countries are tending more and more to convert their timber into manufactured products before export. It is therefore important that every timber-importing country should aim at increasing its production of home-grown timber to the utmost. This can be done both by afforestation (usually a somewhat tardy process) and by bringing existing forests into the highest state of productivity. In the case of State-owned forests, this usually presents no great difficulty. But in most European countries more than half the forest area is privately owned, and it has been found that the out-turn from private forests is generally low unless laws are in force requiring their proper management. Such laws have long been in operation in some

countries, including Norway, Sweden, Finland, Denmark, Austria, and Czechoslovakia. Other countries are realizing that means must be found for increasing the out-turn from their private forests. Laws strengthening the measures of control under previous laws have recently been passed in Italy (1926), Finland (1928), Norway (1932), and Denmark (1935). Important developments are taking place in Germany, where forest administration, formerly the concern of each individual State, has been centralized in Berlin. A law against forest devastation, applying to private forests, was passed in 1934, and further legislation, imposing stricter control over private forestry, is expected. In spite of a forest area amounting to about 24 per cent of the total area of the country, Germany is not self-supporting in timber, and in the past has imported largely from Austria, Poland, and other countries with exportable surpluses. The incorporation of Austria and parts of Czechoslovakia has added important forest areas to the German Reich, but in spite of this, Germany will still be unable to meet all her timber requirements from internal sources.

In the matter of future timber supplies Great Britain is in a particularly bad position, since over 95 per cent of her requirements are met from imported timber. A large scheme of land acquisition and afforestation by the State has been in operation since 1920, but in spite of this, about 80 per cent of the total woodland area is still in private ownership. Private forests, therefore, must play an important part in any scheme for increasing the country's supplies of home-grown timber. There is no State control over private forests, though assistance is given in the form of planting subsidies. The question of adopting effective measures for improving the condition of private forestry is now being considered.

In order to make good the future deficiency in the world's timber supplies, attention is beginning to be directed towards the possibility of developing the extensive forests of the tropics. In their original condition the productivity of these forests is comparatively low, since they consist as a rule of a large number of different species, of which only a few have any market value. But by suitable choice of species and cultural treatment it is possible to secure out-turns in excess of anything obtained from the forests of temperate countries. There are various fast-growing tropical trees which, if grown intensively, would produce high yields of woods that may prove to be useful substitutes for coniferous timber and pulpwood. At present the cost of exploitation and transport precludes any important developments in this direction, but if prices rise appreciably in consequence of the increasing scarcity of timber, it may yet prove profitable to grow plantations of fast-growing tropical trees on a large scale and to develop communications with a view to bringing the produce to the world's markets at a reasonable cost.

Protective Forestry. The disastrous results of destroying forest and other natural vegetation have long been known, but it is only within recent times that the full extent of the damage has been realized. The effects produced by destroying the natural vegetation include the lowering of atmospheric humidity, exposure to dry winds, increased evaporation, the release of wind-blown sands, the removal of fertile soil by erosion, interference with the water-supply, and the general desiccation and impoverishment of the country. The soil brought down from denuded hills is deposited in the rivers below, silting up their beds and causing disastrous floods. The process is greatly aggravated by unrestricted grazing, while in tropical countries

H.M. Forestry Commission]

shifting cultivation is sometimes a contributory cause of erosion and desiccation. In recent years this problem has forced itself on the attention of many countries, and endeavours are being made to deal with it.

In most European countries legislation has long been in force controlling the clearing of forests in mountainous regions and providing for the afforestation of denuded slopes. More recent legislation includes the Italian Forest Code of 1923, which inaugurated a great scheme of protective work, the Swedish Law of 1923 concerning "protection forests", and the Norwegian Forest Protection Law of 1932. In the mountainous parts of Japan extensive afforestation has been carried out for more than two centuries, and systematic torrent-training works were begun about 1880. The Forest Law of 1897 made this work compulsory in every part of the country. In the United States the magnitude of the erosion problem in the western plains region has necessitated the formation of a special Soil Conservation Service.

In many parts of the British Empire measures are being taken to counteract erosion. In the Union of South Africa the question was investigated some years ago by a Drought Investigation Commission, which issued its final report in 1923. As a result, some progress has been made in erosion control. In Australia two recent reports, one for Victoria and the other for South Australia, have made recommendations for counteracting the widespread loss by erosion and soil-drift due to the destruction of the natural cover through overstocking, by rabbits, and by the cultivation of light sandy soils. In India large-scale ravine reclamation work, including afforestation, has been carried out for many years in the dry parts of the United Provinces and has been undertaken more recently in the Punjab foothills. In the Colonial Dependencies considerable attention has been given in recent years to the question of soil erosion and protective forestry. In Northern Nigeria extensive areas have been reserved as protection forests, while an Anglo-French Commission has investigated the causes of erosion and desiccation on either side of the international boundary. In the Gold Coast progress has been made with forest conservation to protect the cocoa plantations and the headwaters of streams. In Kenya a special soil conservation

service has been formed, and works of afforestation have been put in hand, while de-stocking is being carried out in some of the badly eroded areas In Uganda the question of soil erosion and water-supplies has recently been the subject of a special report, which recommended further protective forest reservation. In Nyasaland, where much damage has been done by shifting cultivation, a soil conservation officer has been appointed to undertake and co-ordinate reclamation work

North America. In Canada forestry is one of the directions in which efforts are being made to train unemployed youths, camps having been established in various Provinces where instruction is given in conservation, clearing of undergrowth, and other branches of the industry

Tree planting is being undertaken as part of the programme to be carried out under the Prairie Farm Rehabilitation Act, with a view to improving prevailing conditions in certain areas and providing protection against the erosive and drying effects of high winds

Apart from this, the long-term policy of tree-planting on the prairies is being continued under government auspices from the forest nursery stations of the Dominion Experimental Farms at Indian Head and Sutherland, in Saskatchewan This has now been carried on for 37 years, during which period over 153 million tree seedlings and cuttings have been distributed to between 60,000 and 65,000 farmers. In the spring of 1938, 6 million seedlings and cuttings and 25,000 evergreen trees were shipped from Indian Head to Saskatchewan farmers.

As an example of afforestation work on the part of the Provincial governments during 1938, the planting of 500,000 trees on 185 acres of government-owned land adjoining the Spruce Lake forest reserve, near Brandon, was completed by the Manitoba Forestry Branch. The British Columbia government has an extensive reafforestation programme in hand, and during the year 3 million seedling trees were being prepared at the Green Timbers forestry station, near New Westminster, for planting on an area of 3,000 acres on Vancouver Island.

The loss by fire, insects, fungi, etc., continues to be high. The heaviest loss during 1938 was caused by a serious forest fire—the most disastrous in the history of British Columbia—which raged for some time during August on Vancouver Island, about 100 miles north of Victoria.

The Canadian authorities, both Federal and Provincial, are consistently trying to combat forest fires by preventive measures and fire-fighting methods on the one hand and afforestation on the other.

An interesting movement instituted in Saskatchewan was the formation of a volunteer force of fifty junior forest wardens, who were required to sign a pledge to do all in their power to prevent forest fires, advance tree planting, and improve wood-lots, as well as conserve fish, birds, and animals. (R J A)

The United States, excluding its Territories, now has 630 million acres of forest land. More than 168 million acres of it, non-commercial, must from the standpoint of producing usable timber and timber products be crossed off the national ledger. This leaves 462 million acres of commercial forest land. Less than half of this now bears trees of saw timber sizes, 72 million acres are now virtually a no-man's-land, and the annual drain of species and sizes commonly used is much greater than their annual growth.

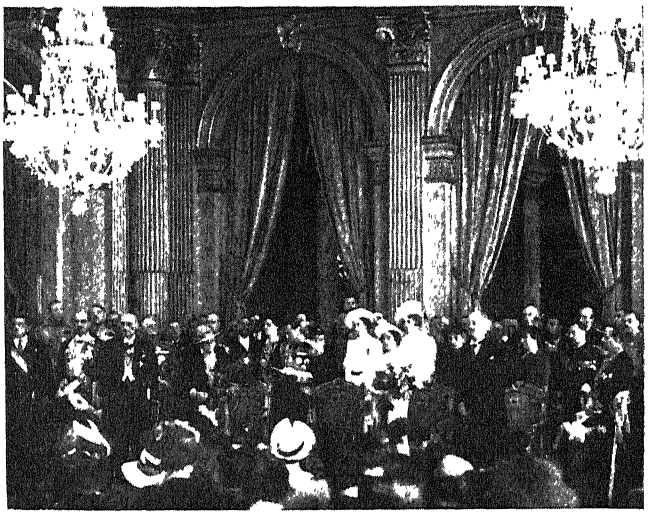
Restoration is needed to make these lands productive, together with a policy recognizing that some 630 million acres, more valuable in forests than for any other purpose, need protection from fire, insects, diseases, and processes of destructive exploitation. According to a special message addressed by the President to Congress, the essentials of a plan of action are co-operation, regulation, and extension of public ownership and management. It is estimated that the best three-fourths of the commercial forest land is still in private ownership In 1937 a check, made by the Forest Service, indicated that in the interests of conservation community and State ownership and management should be extended to 48 million acres, and Federal ownership and management to 59 million acres in and near existing National Forests

The National Forest system now includes 175,238,168 acres of federally owned lands They are distinct from National Parks in that they are administered so that all resources may be used as well as renewed, and more than 1,280 million ft of timber was harvested from them in 1938.

FORMOSA (TAIWAN), a large island in the Western Pacific, between the East and South China seas, bisected by the Tropic of Cancer; area 13,429 sq miles, capital, Taihoku; population (1935) 5,315,642, mainly Chinese. Formosa has been part of the Japanese Empire since 1895, when it was conquered from China. The governor-general is Admiral Seizo Kobayashi. An important Japanese naval base is at Mako, in the Pescadores, islands off the western coast of Formosa. The importance of the island as an aeroplane and naval base has been demonstrated during the hostilities with China Formosa has been intensively exploited, Japanese investment in the island being estimated at 400,000,000 yen (£40 million at pre-devaluation rates of exchange) Most of this capital has been invested in the sugar industry. Many of Japan's needs—sugar, bananas, pineapples, citrus fruits—are largely or entirely supplied from Formosa, which is also a large producer of rice and the world's largest source of natural camphor. In 1936 Japan received over 99 per cent of Formosa's exports and supplied over 80 per cent of its imports. Taihoku was bombed by Chinese aeroplanes in Feb. 1938; but both the loss of life and the material damage were very slight. (W. H. CH.)

FOUNDATIONS AND TRUSTS. In 1938 the National Institute of Economics and Social Research was formed in Great Britain, funds being granted by the Sir Halley Stewart Trust, Lord Leverhulme's trustees, the Pilgrim Trust, and the Rockefeller Foundation Progress was made with the projected Nuffield College, Oxford, for social research, Lord Nuffield giving more land, and Mr. Harold Butler (ex-International Labour Office director) being appointed organizer. The National Playing Fields Association (1925) had dealt, to 1937, with 1,200 fields, of £3 millions estimated present value, the parallel King George's Fields Foundation had then received £395,000 (total of the King George Memorial Fund to Oct. 31, 1938, £604,731). King Edward's Hospital Fund (1897) had £4,102,212 in hand, having made disbursements (1937) of £302,000. Lord Baldwin's Imperial Relations Trust created two scholarships. The Rhodes Birthplace Memorial Trust presented Rhodes's birthplace to Bishop's Stortford, Herts, providing maintenance.

British Dominions. In Australia, outstanding events of 1938 were: (New South Wales) purchase, by the Thomas



Walker Charitable Fund, of the Yaralla Estate (£65,000) for a convalescent home for men, (South Australia) founding of Sir George J. R. Murray's trust (£10,000) for a Law Library, Adelaide. In New Zealand, Canterbury College, Christchurch, benefited by Mr R. Bell's travelling scholarship trust (£5,000). In Canada, the National Research Council of Canada (1916) and the Ontario Research Foundation (1928), subsidized, respectively, by the Dominion and Provincial governments, pursued their activities in the interests of industrial progress

United States. The Carnegie Corporation of New York (1911; capital, $135 millions) and Carnegie Institution of Washington (1902, capital, $33 millions) applied incomes in aid of education and research in fields, respectively, covered and not normally covered by existing organizations, the Carnegie Endowment for International Peace (1910; capital, $10 millions), in furtherance of its avowed policy, distributed (1937) $672,800, the bulk of it to organizations for promoting international intercourse and education and the study of international law; and the Carnegie Foundation for the Advancement of Teaching (1906; capital $27 millions) reported distribution, to 1937, of nearly $33 millions in retiring allowances to teachers, pensions to their widows, etc. The Rockefeller Foundation (capital, $150 millions) bestowed, in 1937, funds totalling $9,500,000 for the advancement of education, particularly in medical, natural, and social science. Important in 1937 was the inauguration of the Charles Hayden Foundation (capital, $50 millions) for the "betterment and enlightenment" of young men, primarily of the cities of New York and Boston.

Europe. In Belgium, M. Louis Empain's children's health trust (1931) was reconstituted (1938) as "Air et Soleil" (capital, 1,500,000 frs.) and he founded (1938) another, "Pro Juventute" (capital, 1 million frs.), for the physical, moral, and intellectual welfare of youth; in 1937 was founded the George Eastman (children's) Dental Institute (capital, 100,000 frs.). In Norway the Wilhelmsen Fund for Bacteriological Research (capital, Norw. kr. 800,000) was founded (1938) at Oslo University. (H. Fw.)

FRANCE. The year 1938 was characterized in home affairs by the progressive weakening and eventual dislocation of the Popular Front, formed before the 1936 elections by a coalition of Radical-Socialists, Socialists, Communists, and some lesser groups. Its beginning saw in office a Chautemps-Blum cabinet, a Popular Front government under Radical leadership, with Socialists participating and Communists theoretically supporting. Its conclusion witnessed in power a Daladier ministry, composed of Radicals and members of the Centre parties, relying for its majority on the Centre and the Right, and with the Socialists and Communists now in open opposition.

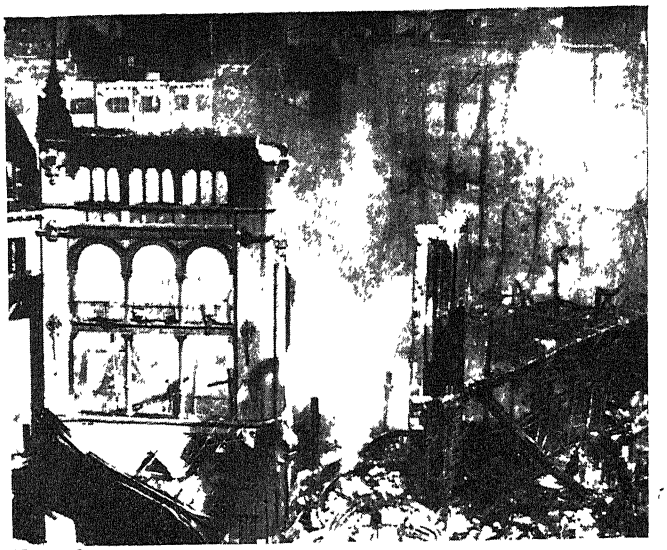
The previous year had passed out in a wave of industrial unrest, culminating in a big Paris transport strike. Nominally the workers, employees of the municipality, were merely claiming similar pay increases to those which had just been granted to State employees. It was widely alleged, however, that the real aim of the men's Communist leaders was to bring to an end the "pause" which M. Blum had proclaimed some months before in order to reassure capital, frightened by the swift enactment of the social laws and alarmed at the insufficiency of the Blum government's financial policy. On Jan. 6 M. Chautemps declared in a press statement that industrial strife must cease, since it was endangering France's security and prosperity. He announced that he was calling a peace conference of workers' and employers' delegates, who would negotiate new agreements to which the government would give the force of law by submitting this code of social peace to parliament. To this conference, however, the big employers represented by the Employers' Federation refused to come.

The Times]
KING GEORGE, WITH QUEEN ELIZABETH AND PRESIDENT LEBRUN, REPLYING TO THE ADDRESS OF WELCOME AT THE HOTEL DE VILLE, PARIS, JULY 20, 1938

This was the position when the Chamber reassembled, and M. Chautemps made a speech which could only be interpreted as an invitation to the Socialists and Communists to overthrow him. There was no vote, however; the Socialist ministers merely resigned, the rest of the cabinet followed them, and the formation of a new cabinet was entrusted to M. Georges Bonnet, the outgoing finance minister.

M. Bonnet was widely credited with having played the leading part in bringing the premier to his abrupt decision. He had long been anxious to break the government's dependence on the Communists, and at the Radical Congress the previous October had been seen behind a manœuvre which nearly led to the ministry's fall then. He was to be disappointed, however, in his hopes of the reversion of the premiership. Not only did the Socialists blankly refuse to have anything to do with his cabinet and the C.G.T. hint at the possibility of a general strike against it, but even his own party, the Radicals, turned against him. He abandoned his attempt; M. Blum vainly essayed to form a ministry of National Concentration ranging from the Communists to the Centre, and eventually M. Chautemps, who had never, after all, been defeated in parliament, was summoned to form a new government in succession to himself. The Socialists refused their participation but promised their support, and the government was formed as an all-Radical one, with M. Delbos staying foreign minister and M. Daladier minister of defence, but with M. Marchandeau minister of finance and M. Guy La Chambre replacing M. Cot at the air ministry. M. Chautemps's ministerial declaration was most conciliatory to the Left. He expressed sympathy towards the idea of a government of National Concentration and promised an old age pensions bill. On Jan. 21 he obtained a majority of 501 votes to one, with 105 abstentions.

"The bigger the government's initial majority, the shorter will be its life", a cynic had forecast, and M. Chautemps was well enough aware of his team's instability to make soundings about the possibility of broadening its basis. He pushed through parliament the first part of his Labour



Code, a Conciliation and Arbitration Bill providing that on a five per cent rise in the cost of living, machinery for the revision of wages should be set in motion. Then, at the beginning of March, he made known his wish to obtain special financial powers to restore capital's confidence with a view to launching a big new Defence Loan He indicated that the pensions bill must be dropped and the 40-hour week to some extent shelved. The Socialists refused to support him, and M. Chautemps submitted his resignation to the President on March 10, once more without having suffered a defeat.

This was the beginning of a crisis which was to have a tragic historic significance, for it coincided with Germany's annexation of Austria. The presence of a stable government in France might have caused the Fuhrer to hesitate, and perhaps even to withdraw at the last moment. The resignation of M. Chautemps and M. Blum's inability to form a cabinet quickly encouraged Herr Hitler in his action. Once again M Blum tried to form a ministry ranging from the Centre to the Communists, once more the Centre refused. Finally, he constituted a Popular Front government with Socialist and Radical participation, M Paul Boncour being foreign minister, M Daladier war minister, M. Dormoy at the interior, and M. Spinasse minister of finance.

M. Blum had formed his cabinet in the hope that it might shortly be possible to broaden its basis into that cabinet of National Concentration that was still at the back of his mind. Members even so far to the Right as M. Marin had been won by the pressure of international events to sympathy with the idea. But a new wave of stay-in strikes in Paris at the end of March dashed these hopes by turning such Right-Wing sympathizers against the Communists again. The Senate early showed its bitter opposition to M. Blum, and when he announced a financial reform plan that included proposals for a graduated capital levy, his doom was sealed. The Chamber voted the plenary powers which M. Blum demanded, but those Radicals who had voted for them were themselves the most eager in urging the Senate to turn the cabinet out. The Senate, by 214 votes to 47, refused to grant M. Blum the plenary powers, and the cabinet resigned on April 8.

On April 10 M. Daladier, President of the Radical Socialist Party, formed a government in which the Socialists refused to co-operate, M. Daladier remained minister for war, M. Bonnet somewhat surprisingly went to the foreign ministry, M. Sarraut held the interior, M. Campinchi the navy, and M. Marchandeau was minister of finance. Two members of the Centre, both favourably viewed by the Left, were brought in, M. Paul Reynaud as minister of justice and M. Georges Mandel, Clemenceau's former collaborator, as Colonial minister, and there were no undersecretaries. The Socialists continued for a time to vote for the government; they did not pass into open opposition till the Paul Reynaud financial decrees at the end of the year. The Communists abstained, and the first division in the Chamber gave the new ministry a majority of 508 to twelve. But the Popular Front was finished. The election of a National Republican to a senatorial seat in Paris seemed to many to mark the swing of opinion and the desire of the country to rid itself of Communist influences.

The new government proved by its actions its determination to start a new leaf. It put an end to industrial unrest, as exemplified by the metal-workers' strike in the Paris district, which involved 210 factories and 157,000 workmen. The social laws were to be preserved, but they were to be adapted and rendered more flexible. The

Keystone]
THE GREAT MARSEILLES FIRE BROKE OUT IN THIS STORE IN THE CANEBIÈRE (OCT. 28, 1938), HERE SEEN THE NEXT DAY

C.G.T. would not be allowed to become an instrument in the hands of any particular party. The financial position, it held, demanded a new effort in the economic sphere, in production and in commerce, for there could be no happy working class in a ruined state. "All round us Europe is changing", M. Daladier declared, in a broadcast speech; "whole nations are being ruined by new ideologies. States are disappearing, and new Empires are growing up. That is why national defence to-day goes far beyond the mere question of military organization. All our problems—social, political, financial, and economic problems—are closely linked with the problem of our security. Isolated problems no longer exist There is only one problem, and that problem is the safety of our country".

The first step was a new devaluation, the second since the Popular Front came to power. With the consent of the two signatories of the 1936 agreement, Great Britain and the United States, it was decided to allow the franc to decline to 179 to the pound, and there to stabilize it. Thus in two years the Poincaré franc has lost 56 per cent of its value. A series of decrees aimed at bringing about an economic revival. In August M. Daladier took measures to introduce a 48-hour week in factories necessary for national defence. "France is lost", he said, "if she cannot work under normal conditions". Two ministers, M. Frossard and M. Ramadier, thereupon resigned, and were replaced by M. de Monzie and M. Pomaret. Some weeks later M. Reynaud, the minister of justice, exchanged portfolios with M. Marchandeau, finance minister, and resolutely attacked the financial problem. His November decrees, he claimed, constituted a coherent scheme of financial reconstruction by means of an economic revival and the increase of production. But there were many critics, and those, not only on the extreme Left, who complained that the Reynaud decrees were on the contrary a collection of disparate measures forming no definite system, hitting hardest at the working and middle classes and relaxing rather than making more stringent the checks on well-to-do investors with a preference for bearer bonds instead of registered shares. They regretted this the more, since M. Reynaud's financial powers were acknowledged, and the unfavourable balance of trade was disturbing: it increased from five milliards in 1935 (francs at 1928 par) to over seven milliards in 1936 and in 1937 reached nine milliards 153 millions.

Under the new plan, at all events, increases in taxation will add about nine milliards to the revenue. The 1939 budget provides for an estimated revenue of 66,345,170,829 francs and an expenditure of 66,317,371,619. This does not include extraordinary expenditure on national defence, which will be covered by loans (35 milliards instead of 55). A committee of administrative reorganization will cut down unnecessary expenditure. The rejection of exchange control, the lowering of the rate of interest with a view to the expansion of credit and the promotion of a liberal economy with high production are other characteristics of the measures adopted by the finance minister. In the economic field, the first results have been encouraging. Several milliards of francs have repatriated themselves, the franc has gone up, and it has even been necessary to check this tendency, the rate of Treasury bonds has been reduced; stocks have risen and the bourse is more active, there has been a slight decrease in unemployment and increase in goods traffic. But the reception of the decrees was not fortunate. They brought to a head once more the difference between the two seemingly irreconcilable tendencies in the Popular Front: those who would seek to "bring capital to heel" when it takes fright at large measures of social reform, and those who would win back its support by wide concessions to orthodox economics. There was considerable popular questioning over the incidence of the new taxes, and it is possible that a number of Radicals might have voted against them had not the C.G.T. been jockeyed by their Communist wing into calling a one-day protest strike against them. The government's decision to mobilize the transport workers made it obvious before the day that the strike would fail, and when the decrees came before the Chamber, M. Daladier obtained a vote of confidence by 315 votes to 241. The Socialists and Communists had both moved into opposition and a new majority had been formed. The reign of the Popular Front was over.

External affairs have had a very strong repercussion upon internal politics during 1938. France has not looked on unmoved while Germany, since March 6, 1936, has destroyed bit by bit the treaty of Versailles and the Europe of 1919. The civil war in Spain, the high-handed annexation of Austria by Germany, and the dismemberment of Czechoslovakia have given rise to a grave situation in Europe which very nearly ended in war. It seems probable that the *Anschluss* with Austria succeeded only because a ministerial crisis and serious internal difficulties paralysed French action. A *démarche* from Paris asking the Duce to unite with the Western Powers, France and Great Britain, to save the independence of Austria was rejected. This enormous increase of power on the part of Germany, which threatened the independence of every state, had the result of tightening the bonds of friendship and collaboration between France and Great Britain. This was the significance of the agreements signed in London on April 27–29 by the British ministers and MM. Daladier and Bonnet. These agreements showed how fully the two governments had recognized the community of their interests and of "those national and international ideals which unite the two countries". The two governments, they laid down, would pursue a concerted policy in Spain and in Czechoslovakia. France was bound, by the treaty of 1925, to go to the aid of Czechoslovakia if she is attacked. Great Britain had not the same engagements, but, as Mr. Neville Chamberlain said on March 24, "Where peace and war are concerned, it is not only legal obligations that count". The visit of the King and Queen of England to Paris (July 19-22) and the extraordinarily warm welcome they received from the French people afforded striking confirmation of the close accord between the two nations.

This accord was clearly shown with regard to Czechoslovakia. If it did not succeed in preserving the integrity and the moral independence of Czechoslovakia, it at any rate assured peace. The partial mobilization of Sept. 24 was carried out under conditions of calm and resolution which showed that the French people is prepared to carry out its duty in all circumstances. But German hegemony has been established throughout Central and Eastern Europe. The elimination of Czechoslovakia as a political and military factor, of which the departure of the French Military Mission from Prague on Dec. 14 was the symbol, affords a dangerous increase of power to Germany. But the passion for peace among all the peoples was clearly shown. M. Daladier said, on his return from Munich, "We forced a peace plebiscite in four countries".

THE AUSTRALIAN WAR MEMORIAL AT VILLERS-BRETONNEUX, UNVEILED BY KING GEORGE, JULY 22, 1938

Nevertheless, the situation continues to be fraught with danger for the future Certain newspapers advocate that France should detach herself from the Continent of Europe and should abandon the hegemony to Germany, devoting herself entirely to her colonial empire But that would appear an impossible choice If the power of Germany were to be allowed to develop unchecked in Europe, she would gain so great a predominance that there would be no security either for the French or for the British colonial empires Herr von Ribbentrop visited Paris on Dec 6 and signed an agreement with M Bonnet by which France and Germany declare that they have no territorial demands upon each other, and undertake to settle by diplomatic methods any difficulties that may arise between them This agreement would seem to indicate that Germany does not want war, but is preparing to pursue a policy of economic and political hegemony in Eastern Europe, from which she wishes France to hold entirely aloof. The attacks and demands made in December in the Italian Press show that Italy is trying to stir up confusion in order to obtain some advantage which France is in no way prepared to grant to her. (M Bonnet's statement on Dec 15 is quite categoric as to that)

Agreements were signed on July 1 and 4 between France and Turkey—France acting in virtue of her Syrian mandate —which settled the difficulties regarding the Sanjak of Alexandretta and the Turkish population there, which amounts to forty per cent. The Sanjak remains an integral part of Syria, but a Turkish armed force will in future have the right to remain in occupation there, together with French and Syrian forces. The political and military importance of Turkey on the European chessboard explains the concessions made by France in this matter.

It is unlikely that they would have gone so far had it not been for the disturbed state of the continent and the necessity for France to be certain of her security in the eastern Mediterranean at any rate. Similar considerations explain the non-ratification of the Franco-Syrian Treaty, under which Syria should soon have been receiving the status of 'Iraq, a delay which provoked widespread anti-French demonstrations at the turn of the year.

FRANCIS I, Prince of Liechtenstein, was born on Aug. 28, 1853, and died at Feldsberg, Moravia, on July 26, 1938. He succeeded to the throne in 1929, on the death of his brother, John II. Francis was in early life a member of the Austro-Hungarian diplomatic service, and from 1895 to 1899 was Ambassador in St. Petersburg. In 1929, following his accession, he married Elisabeth Bethlenfalva, *née* Gutmann, a Viennese of Jewish ancestry. On March 31, 1938, finding the European situation too complex for a man of his great age to grapple with as ruler of an independent principality, Francis delegated his powers to his great-nephew, who then became Regent and, on the old Prince's death, succeeded as Francis Joseph I.

FRAZER, SIR JAMES GEORGE, O.M., F.R.S., D.C.L. (1854), British anthropologist, philosopher, and student of comparative religions, was honoured by a knighthood in 1914, the Fellowship of the Royal Society in 1920, the Order of Merit in 1925, the freedom of his native city, Glasgow, in 1930, the bestowal of various foreign honours and the honorary degrees of many universities, culminating in 1938 in the doctorate of philosophy of the University of Athens, conferred in recognition of his many services to the study of the Greek classics.

Vandyk
SIR JAMES FRAZER

Sir James, a notice of whom will be found in the *Ency. Brit.*, vol. 9, p. 710, continued his very extensive literary output well beyond his eightieth year; and among his more recent works are: *The Devil's Advocate: a plea for superstition* (1927), a five-volume edition of Ovid's *Fasti* (1929), *Creation and Evolution in Primitive Cosmogonies* (1935), the third and fourth volumes of *The Fear of the Dead in Primitive Religions* (1936), and supplements to *The Golden Bough* (*Aftermath*, 1936), and *Totemism and Exogamy* (*Totemica*, 1937).

FREEMASONRY. In the past year the attack on democratic governments in Central Europe has been accompanied by strenuous assaults on Freemasonry. In Austria the Grand Lodge of Vienna has been suppressed and its chief officers interned; while in Czechoslovakia both Grand Lodges—the "National" and the "Lessing zu den Ringen"—have been forced to suspend working. On the other hand, political pressure in Switzerland and misrepresentation in the Netherlands have been successfully resisted. These events, and other repercussions of the political situation, led in August to an exceedingly important joint proclamation from the three Grand Lodges of England, Scotland, and Ireland. This statement defines and stresses the purely religious tenets of the order—as belief in God and in the sanctity of the Bible. A Freemason is forbidden to countenance any act tending to subvert the peace of the state which he inhabits. The duties of loyalty and good citizenship are expressly inculcated: but beyond this the Grand Lodges forbid alike *individual* discussions of theological or political questions or *general* opinions on questions of domestic or foreign state policy. This proclamation admits the existence of irregular quasi-Masonic bodies which do not adhere to these principles, but refuses recognition to them. As a corollary to this statement it may be safely inferred that Masonic policy (at least among English-speaking peoples, who form nine-tenths of the whole) strongly favours the spread of international understanding by personal contact, and the relief of individual distress by private charity; but expressly discourages the application of Lodge funds to the relief of political refugees, or any other formal expression of collective sympathy.

In December the M.W. the Grand Master of England, H.R.H. the Duke of Connaught and Strathearn, to the great regret of all Freemasons announced his retirement. His 38 years' services to Freemasonry had seen the number of Lodges within the Craft more than doubled. H.R.H. the Duke of Kent was nominated as his successor.

In Great Britain an increased membership of 100,000, and the consecration or preliminary approval of approximately 45 Craft Lodges were recorded. The Canadian total of 173,654 members in 1,381 lodges also represents a marked increase. Here the year was remarkable for the bicentenary celebration of the foundation of Freemasonry in what is now the Dominion of Canada. This was held at Halifax, Nova Scotia, on July 11, and was attended by deputations from numerous Grand Lodges, including those of England, Scotland, and Ireland. These subsequently made an extended tour throughout the nine provinces of the Canadian Jurisdiction, and over the border to Massachusetts and New York, U.S.A. To the English deputation "the relations which exist between the Grand Lodge of Canada and U.S.A. are most happy, and obviously reflect not only a mutual respect but a genuine fraternal feeling".

In U.S.A the 50 Grand Lodges reported a total of 2,577,028 Master Masons. A marked strengthening of masonic ties, particularly with those of Latin America, was felt throughout the year. (T. S.)

FRENCH ACADEMY. Charles Maurras and André Maurois were elected members of the French Academy in 1938.

A famous French Review published the remark: "The last elections at the Academy have created a sensation. Everybody thought that Maurois had long been a member and that Maurras never would be one". André Maurois is, in the best sense of the word, *académique*, and he is one of the most celebrated persons in an Academy in which only a minority are celebrated. It was universally felt that Maurras's election, which came first, was not so easily justified, and it was even suggested that the Academy was influenced by the fact that Maurras had only just come out of prison. He had been given two years by a merciless tribunal for inciting his followers to murder M. Léon Blum—after an assault on M. Blum, by a follower of Maurras, had taken place. The Academy is suspect, in its majority, of being anti-republican. In some manner, the election of Maurois, who is considered to be a liberal, was a sort of apology to the Republic from the Academy. In December Jérôme Tharaud was elected. He represents the more worldly element in the famous *équipage* of the two brothers Jérôme and Jean Tharaud, who are best known for their books about the strange existence of Central European Jews in the peace periods of long ago: *À l'ombre de la Croix*, etc. This election is universally welcomed, as the great literary merits of the Tharauds are beyond dispute. (D. S.)

FRENCH COLONIAL EMPIRE. Total area (approx.), 4,787,000 sq. miles; Total population (est. Dec. 31, 1936), 111,545,000. The following table lists the French colonies, protectorates, mandated territories, etc., together with essential statistics appropriate to each of them, including the mother country itself:

Country	Area sq. miles (approx.)	Population est Dec. 31 1936 (000's omitted)	Capital	Status	Governors, Premiers, etc.

Pacific Islands, including Society Is., Tuamotu Is., Tubuai Archipelagos, etc.	1,540	40	Papeete	colony	*Governor:* M. Chastenet de Gurry.

* Population 1936 census.

FRENCH EQUATORIAL AFRICA. The economic situation in French Equatorial Africa has shown a continuous improvement since 1936. In 1937, exports reached 510,898 tons, 155,457 tons up on the previous year, and were valued at 256,350,000 francs, a 161,761,000 francs increase. Imports also increased by 22 per cent. This progress was carried on in 1938.

These increases, coinciding with a severe restriction of administrative expenditure, made it possible to balance the 1937 budget of 197,517,640 francs with an eight million francs surplus. This was achieved despite financial assistance to agriculture, the fight against sleeping sickness, road and river improvement, and improvements in the port of Pointe-Noire.

The Colonial Minister, by a decree of Dec. 31, 1937, substituted for the central administration set up in 1934 a

certain degree of autonomy in the administrative subdivisions. Natives will henceforth be admitted to the municipal committees, the chambers of agriculture and commerce, and the administrative council Another decree enables half-breeds to obtain French citizenship more easily Finally, a system has been instituted for defining rights of property in accordance with local custom, thereby assuring the stability of ownership of the land.

FRENCH GUIANA, a French colony in north-eastern South America including the separate interior territory of Inini. Language, French ; capital, Cayenne (pop. 11,704) ; governor, René Veber. The area, including Inini (area, 25,000 sq. miles) is 34,600 sq. miles. The population, including nearly 4,000 of Inini, but excluding uncivilized Indians, was officially estimated at 37,000 in 1938, with about 6,000 foreigners. The colony is administered by a governor and general council, and is represented in the French parliament. Inini has a separate council. The famous French penal colony, Devil's Island, situated along the northern border, is administered separately. Plans are under way to eliminate it entirely, but lack of penitentiary facilities elsewhere compelled its continuance in 1938. In 1937, imports and exports totalled respectively 52,700,000 francs and 36,900,000 francs, representing gains of 18½ and 25 per cent, accounted for by devaluation of the franc. Imports, chiefly foodstuffs and manufactured articles, were 64·7 per cent from France, with the United States and French colonies next. Practically all the exports (97·3 per cent), comprising principally gold (9,205,219 francs value), tulip-wood, rum, and bananas, went to France The first 11 months of 1938 showed 50,900,000 francs imports, 42,800,000 francs exports. French Guiana has regular external steamer and air transport services, 7¾ miles of railway, 155 miles of highways, and good interior waterways. Monetary unit: the French franc. (L. W. Be.)

FRENCH INDIA. The latest available statistics for this French territory are given below :

Area and Population :
Area 190 sq. miles.
Population (est. Dec. 31, 1936) 300,000 (Europeans 500).
Chief Towns : Pondicherry (46,200 ; cap.) ; Chandernagor (27,200) ; Karikal (17,000) ; Mahé (13,700) ; Yanaon (5,000).
Governor. M. Bonvin.
Production 1936 :

Expenditure, ordinary (est.)	35,091,089 ,,
Expenditure, extraordinary (est)	2,277,000 ,,
Currency	rupee (Rs 1 = 11 francs)

FRENCH INDO-CHINA. Repercussions of the Sino-Japanese war were keenly felt during 1938 The attitude of the Indo-Chinese authorities was in entire accordance with the policy of the French government They remained friendly with China, and strictly correct towards Japan. The transit of arms by the Yunnan railway has been rigorously supervised and has been of insignificant dimensions. Measures were taken for the defence of Indo-China, and the native army was increased by 20,000.

Economic development is in progress under the intelligent guidance of Governor-General Brévié Saigon has become, after Algiers and Oran, the third most important port of France overseas, reckoned on a basis of total tonnage of merchandise imported and exported.

European and native colonists, especially the latter, have reclaimed vast tracts of marsh for ricefields and of forest for rubber. These two forms of colonization, far from competing, are complementary to each other. In spite of a slight decrease in export tonnage, foreign trade has increased from 268 to 417 million piastres, and exports have increased from 74 to 101 millions. The main problem which still arises is that of providing land or work in the factories for the very dense population (in places 500 to the square kilometre) of the deltas of Cochin-China and Tonkin. The Indo-Chinese railways have put the Saigon–Hanoi line into regular action. The port of Camranh is being developed. Air-France has introduced innovations in the shape of Dewoitine trimotors, and has organized the Hong Kong-Damascus route via Hanoi and Saigon. (R. Pin.)

Area and Population :
Area 283,000 sq. miles.

FRENCH LITERATURE. Nothing very new happened in French literature during the year 1938. Preoccupation with political events amounted to anguish and created an atmosphere unfavourable to literature. Talented young men might get their books published (two notable novels by new writers were: *La Nausée*, by Jean Paul Sartre, and *Le Quartier Mortisson*, by Marie Mauron), but few readers took them seriously. For entertainment, the public looks occasionally, when it needs that sort of entertainment, to well-established favourites. But that sort of entertainment is obviously less and less sought after Literature is too mild, too ineffective a soporific to combat the nervous excitement of politics, national and international. It seems probable that, should a new masterpiece be published, it would go unnoticed But all the favourites gave new books; and many, very good books. As a rule the technique of an experienced writer grows better with oncoming age, and Duhamel, Maurois, Romains, Jacques Chardonne, Supervielle among others, published some of their most serious work.

Georges Bernanos created perhaps the greatest sensation of the year with *Les Grands Cimetières sous la Lune*. But the sensation was political rather than literary Bernanos, a violent catholic, attacks unrestrainedly the behaviour of the Franco party in the Balearic Islands. He was there, and the violence of his feelings against Italian soldiers and Spanish clergy is given full vent in the violence of his language. Completely sincere, he is extravagantly romantic, as his title indicates.

It was a mere coincidence, but a somewhat sinister one, that made Jules Romains publish this year *Prélude à Verdun* and *Verdun*, the fifteenth and sixteenth volumes of *Les Hommes de Bonne Volonté*. These War books are among the very best of the series, and among the half-dozen best books on the War. Romains' sense of humour has full play in describing some of the situations created by the War; but his sense of the pity of it is admirably conveyed; and his descriptive powers must be admired.

As a contrast, *Cécile parmi nous*, of Georges Duhamel, the seventh volume of the Pasquier series, is a restful tragedy of domestic happenings. We fully participate in Cécile's tragedy when she loses her baby and her husband; this is the sort of tragedy we like in literature. It is less ominous than books about Verdun. Cécile is one of the most charming ladies in literature: a sort of musical angel who has wandered amongst men—and who wants to have a baby. Duhamel's powers in the pathetic first brought him fame with his *Martyrs* and are fully exercised here.

Maurois published a masterpiece in the art of biography, *Chateaubriand*: a lovable nature, a *poseur*, a sceptic, a dreamer all in one; though perhaps not all at the same time always. A kaleidoscopic man, and a genius at self-presentation and at prose writing. Maurois' book is abundantly precise and scholarly and yet always alive.

Alain, who is not yet sufficiently known to the English public, though he has a great reputation in France, published an excellent selection of essays: *Esquisses de l'homme*. Alain is one of the best essayists in French literature; his essays never lengthen to more than four pages. He has a formidable number of volumes of them. This year's volume is as good as any to begin with. He talks about any subject under the sun and beyond the sun, so an analysis of his books is impossible. But his extraordinary vivacity of thought and expression, and his unexpectedness make the reading of his short essays a constant pleasure; he has a surprise in store for the reader at every turn of the page, as when he explains to the sleepless that it is much easier to sleep if you keep your boots on

Marcel Jouhandeau, with his *Chroniques maritales*, adds a volume to a kind of geographical survey of marriage. Never has the relationship of a married pair been submitted to so methodical an investigation The chief result is the fact that conjugal love is an affection *per se*, unconnected with sexual emotions, or romantic feeling, or love proper The subtlety of Jouhandeau is at times appalling and at times a little dreary. But he is one of the best writers now living.

Jacques Chardonne, who is well known as a novelist, gave us a charming autobiography in *Le Bonheur de Barbezieux*, and incidentally a true and queer picture of French provincial life

Jules Supervielle is acknowledged by most of the literary public as the best poet now writing after Paul Valéry. *La Fable du Monde* is a collection of poems containing a delightful and fantastic sort of mythology, in which a very puzzled God looks helplessly at his adorable but terrifying children. Delicacy and truth rather than forcibleness are Supervielle's strings. Lovers of poetry will regret the death, on Nov. 1, of Francis Jammes.

Pierre Hamp, in a genre which is all his own, in which literature is often roughly pushed aside by more interesting information, has published *Gueules Noires*, concerned mostly with work in the coal-mines. Hamp has a most forcible style and elementary but unavoidable feelings.

To wander a little from literature proper, a great event of its kind is the end of the publication by Emile Bréhier of a translation of Plotinus; and R. Aron, in *La philosophie de l'histoire*, brings to our attention facts and ideas which are indispensable at the present turning of history. (D. S.)

FRENCH WEST AFRICA AND THE SAHARA. The history of French West Africa in 1938 is chiefly concerned with the efforts of Governor-General de Coppet to stimulate its economic development.

Of a budget of 1,300 million francs, communications took 222,277,000 francs. Credits for works and equipment in 1938 exceeded by 145 million francs the 1937 figure. The chief items of expenditure were the modernization of the Kayes–Niger railway; the improvement of the line from Abidjan to Azaguie to allow the transport of material for the construction of the port of Abidjan; the enlargement of the ports at Dakar and Conakry; and surveys for the extension of the Ivory Coast railway from Bobo Diulasso through Ouagadougou, in order to feed the dense Hoaga population and provide against famines in the Sudan and Niger colonies. The Niger office meanwhile continued the big construction works on the Sansanding dam.

Ricefields have been started in Lower Guinea, and in the regions bordering on the Sahara wells have been dug with a view to facilitating communications across the desert until such time as it is possible to instal nomads on the irrigated lands.

The trade of French West Africa, which in 1937 increased by 25 per cent to 3,748,171 tons valued at 3,206,556,000 francs, of which 3,122,101 tons were exported, rose again in 1938. France is still French West Africa's chief customer.

The economic progress of the negro peasant is making him a serious rival to the French colonist. On the Ivory Coast, of 158,000 acres of coffee plantations 103,000 belong to natives; of 197,000 acres of cocoa plantations 170,000 are native-cultivated. It seems likely that the entire production of cocoa will pass out of European hands, as

has already happened on the neighbouring Gold Coast. Moreover, the government, which in French West Africa presides over a state-controlled economy, tends to reserve highly productive cultivation for the natives and industrial production for the Europeans. These peaceful developments were interrupted by the tragic incident of Thies On Sept. 27 strikers on the Dakar–Niger railway attacked police and troops The troops opened fire, and six strikers were killed and fifty wounded In France, the Left accused the extreme Right of fomenting the unrest in order to undermine the Governor, whose hostility to business interests was known; the Right condemned M. de Coppet's social measures. M. de Coppet returned to Paris in October, and M. Boisson, High Commissioner in the Cameroons, went to Dakar as temporary Governor.

(C. A. J)

Area and Population :

Area 1,807,700 sq. miles.

Population (est. Dec. 31, 1936) 14,700,000 (Europeans, 24,800).

Territories and their Capitals: Senegal (St. Louis), Mauritania (St. Louis), French Guinea (Conakry), Ivory Coast (Abidjan), Dahomey (Porto Novo), French Sudan (Bamako), Niger (Niamey).

Governor-General. M. de Coppet.

FRERE, WALTER HOWARD, English ecclesiastic, was born in 1863 and died on April 2, 1938. He was educated at Charterhouse and Trinity College, Cambridge, and Wells Theological College. He was curate at St Dunstan's, Stepney, from 1887 to 1892, when he joined the Community of the Resurrection, of which he was Superior from 1902 to 1913 and from 1916 to 1922. In 1923, after having first declined the appointment, he became bishop of Truro, being the only member of a religious order to become a bishop in the Church of England since the Reformation. In 1935 he resigned owing to ill-health, and returned to the Community at Mirfield. His publications include *The Use of Sarum* (2 vols., 1898 and 1902), *New History of the Book of Common Prayer* (1901), and *Russian Church History* (1918). He was also an authority on plainsong music, and did great service to English hymnology by his share in the preparation of the revised edition of *Hymns Ancient and Modern*, published in 1904.

FREUD, SIGMUND (1856–), Austrian psychologist and founder of psychoanalysis, of whom a biographical notice will be found in the *Ency. Brit.*, vol. 9, pp. 836–37. In spite of his advanced age and the troubled state of his country in recent years, he has continued his scientific work, especially as director of the International Journal of Psychoanalysis. Awarded the Goethe prize at Frankfurt in 1930 and elected a foreign member of the Royal Society in 1936, Freud has not only influenced the activities of specialists on the subject of psychoanalysis, but has also given a powerful impetus to psychology in general and affected many other fields of mental activity. The majority of his works have been translated into English, *The Interpretation of Dreams* being one of the most famous. Shortly after the annexation of Austria by Germany in March 1938, Dr. Freud left Vienna and settled in London, where it is understood he is engaged in completing a psychoanalytic work in connexion with the Bible.

FRIENDS, THE SOCIETY OF. The "London Yearly Meeting" of the Society of Friends, which includes the Quakers in Great Britain and in the Dominions, except Canada, has a membership of 20,444, according to its 1938 tabular statement. This is a net increase of 44 on 1937. There are 2,108 Friends in Ireland Membership of the American and Canadian Yearly Meetings is 111,592.

Most of the new groups in Germany, France, Holland, Czechoslovakia, and Sweden, attracted to Quakerism by war-time Quaker relief work, are now independent "Yearly Meetings". There are older-established Meetings in Norway, Denmark, India, West China, Japan, Palestine, and Madagascar. Quaker missions influence thousands in Africa and Central America.

Twelve countries were represented at the first meeting, in Denmark in Sept 1938, of the World Consultative Committee appointed by the Friends World Conference at Philadelphia in 1937.

While emphasis is increasingly laid on the building up of a strong spiritual life in the Society, outward expressions of Quakerism more readily lend themselves to record. In Great Britain, Friends have taken a leading part in allotment and other work for the unemployed, in penal reform and similar activities, in education and in peace work There are five Quaker M P s. The third decennial conference of Quaker employers took place at Birmingham in April

In the U.S.A , the various "branches" of the Society co-operate through the American Friends Service Committee in work camps in distressed areas, peace work, etc. With British Friends, the Committee is responsible for the Quaker centres in European cities and in the new centre being established at Shanghai. British and American Friends have joined in relief work for both sides in Spain and for non-Aryan and other refugees from Central Europe.

In November the largest "Yearly Meeting" in the history of British Friends declared: "We have re-affirmed the testimony of our Society against all war for whatsoever purpose and have determined to make that testimony our own to-day". (*See* PACIFISM; also A. Neave Brayshaw *The Quakers, their Story and Message*, 1938.) (H. W. PE.)

FROBENIUS, LEO, German morphologist and explorer, was born in Berlin on June 29, 1873, and died at Biganzolo on Aug. 9, 1938. Having founded in 1904 the German Central African Research Expedition, he made between that year and 1915 seven journeys, in which he explored the Congo Basin, the Upper Niger, Togoland, the Northern Sahara, Western Sudan, El-Obeid, Algeria

Associated Press]
DR. LEO FROBENIUS

and Tunisia, Turkey, and Northern Abyssinia. In 1924 he founded the Institute of Cultural Morphology at Frankfort-on-Main. In 1928 he visited the Zimbadwe ruins in Rhodesia, and formed the opinion that these were the remains of an outpost of Sumerian culture. In 1934 Dr. Frobenius explored some of the remotest districts of the Sahara. Later he became director of the Racial Museum at Frankfort. His publications include *Indian Journey*, a study of the connexion between South African and Indian civilization, based upon the author's expedition to India, and *Atlantis · The Folk-Tales and Poetry of Africa*, 12 vols., 1930.

FRUIT PRODUCTION. Frosts in May 1938 throughout Europe caused much damage to the fruit blossoms and the resultant crops were small. Certain apple varieties, such as Worcester Pearmain, Laxton's Superb, Lord Derby, and Grenadier, appeared to have some powers of resistance, whilst Bramley's Seedling and Cox's Orange proved very susceptible. Orchard heating was only partially successful, and the smoke from the oil heaters became a public nuisance. Some good crops were gathered in orchards in favoured sites, or where bees were used for pollination purposes. The study of the occurrence of frost pockets, and methods of orchard heating are now the subject of research at the Fruit Research Station, East Malling, Kent.

Marketing. In England the formation of small groups for marketing purposes (see *Ency. Brit. Book of the Year*, 1938) was further developed during the year by the formation of a marketing group in Worcestershire and another in Kent. Large packing-houses and stores have been erected in Kent and Essex.

New Planting. New plantings in England are confined to dessert apples and dessert plums and pears. At present only about twelve per cent of the pears are home grown and an expansion of the home industry is desirable and possible. Varieties planted include Laxton's Superb (early), Williams Bon Chretien, and Conference. Research work has yet to indicate precisely the most profitable stocks for pears and also the more efficient sprays.

The National Fruit Trials, Wisley, England, have shown the merits of such new dessert apples as Lord Lambourne, Ellison's Orange, and Laxton's Superb, and these with Worcester Pearmain and Cox's Orange Pippin are being planted.

Small Fruits. In all countries many stocks of strawberries are infected with virus disease and give unsatisfactory yields. Schemes are in existence for the multiplication in isolation and distribution to the strawberry growers of proved healthy plants. The English scheme embraces at present Royal Sovereign and Sir Joseph Paxton varieties, raised and distributed by the East Malling Research Station, Kent. Many growers have, however, given over virus-susceptible kinds and have planted kinds that are tolerant —such as Oberschlesian, Tardive de Leopold, Huxley, and Pillnitz. The virus factor is the important one in strawberry culture, and even now is only partially solved. Meanwhile, supplies of fruit are less than the public demand.

Crops of other soft fruits were not satisfactory in Europe in 1938, generally because of frost damage and the prolonged and continuous drought. Cultivated blackberries gave the best crops. The most popular blackberries are Parsley Leaf, the Himalayan Giant (an American introduction), John Innes, and Bedford Giant.

Citrus Fruits. *Grape Fruit.*—In recent years the world's production of grape fruit has increased rapidly, and the increase continues, for the chief centre of production is the U.S.A., though substantial quantities are now raised in Palestine, South Africa, West Indies, and British Honduras. Consumption in Great Britain has risen from 168,000 cwt. in 1925 to 1⅓ million cwt. in 1937: the supplies coming from Palestine (763,000 cwt.); South Africa (206,000 cwt.); West Indies (93,000 cwt.); and British Honduras (7,000 cwt.); substantial supplies are also sent from Argentina, Brazil, Cuba, Portuguese East Africa, and the U.S.A. Experience suggests that this fruit grows best in land adjacent to the sea coast. Supplies to Great Britain are continuous from January to December and the monthly consumption almost regular.

Oranges The United States, Spain, Italy, Palestine, South Africa, and Rhodesia are centres of orange production. None is grown for market in Great Britain. Imports to England in 1937 reached 12½ million cwt., coming mainly from Palestine (4½ million cwt); Spain (3¾ millions); South Africa (2 millions); and Brazil (1½ millions). Since 1910, supplies have much increased from South Africa, Palestine, and Brazil, and declined from Spain and the U.S.A. The oranges from Spain and Palestine arrive from December to May, and those from Brazil and South Africa from June to November Supplies are continuous.

The industries in both South Africa and Palestine are of recent creation. Trees are still young, many having not yet reached the full age of bearing. The area to oranges in Palestine is 300,000 dunums, of which rather more than half belongs to the Jews The Jaffa orange of Palestine is large, oval, and of a distinctive type favoured in the markets: its sweetness and flavour are famed.

A large part of the Union of South Africa has an excellent climate for citrus fruit, and orange soils are found in parts of the Cape, Transvaal, and Natal, near the sea coast. The land is usually irrigated with water. Lack of concentration of the industry has increased the difficulty of preparation and assembly for market.

The South African orange comprises the Washington Newel and the Valencia Late and the Naartjes (tangarine). The fruit before shipment is subjected to a rigid system of government inspection. The trees are still young, and exports should increase.

Bananas. The banana stands third (apples and oranges rank first and second) on the list of the popular fruits of English people, and it is estimated that 15·2 lb. per head are eaten, all of which are imported, the principal sources being the West Indies, 86 per cent; Brazil, 8·2 per cent, and the Canary Islands, 2·1 per cent.

The trade has much altered in recent years. Supplies from Central America and the Canary Isles have declined, and are now not very important, whereas those of the West Indies have shown remarkable development. This success has been assisted by the work of research scientists at the Imperial College of Tropical Agriculture, Trinidad.

Pineapples. For Europe, the most important areas of production of pineapples are the Azores, where fully 75 per cent of the fruits for England are obtained. In recent years South Africa has also developed a trade. The trade in canned pineapples is, however, more important than the trade in raw fruits. Imports of canned pineapples into Great Britain alone exceed a million cwt. annually, and show constant increases. The chief source of supply of canned pineapples is Malaya (over 900,000 cwt.); smaller sources being the U.S.A., Hawaii, and Japan. In Malaya the area planted is over 50,000 acres, the chief areas being Johore, Singapore, and Selangor, and both production and

and Tunisia, Turkey, and Northern Abyssinia. In 1924 he founded the Institute of Cultural Morphology at Frankfort-on-Main. In 1928 he visited the Zimbadwe ruins in Rhodesia, and formed the opinion that these were the remains of an outpost of Sumerian culture. In 1934 Dr. Frobenius explored some of the remotest districts of the Sahara. Later he became director of the Racial Museum at Frankfort. His publications include *Indian Journey*, a study of the connexion between South African and Indian civilization, based upon the author's expedition to India, and *Atlantis : The Folk-Tales and Poetry of Africa*, 12 vols., 1930.

FRUIT PRODUCTION. Frosts in May 1938 throughout Europe caused much damage to the fruit blossoms and the resultant crops were small. Certain apple varieties, such as Worcester Pearmain, Laxton's Superb, Lord Derby, and Grenadier, appeared to have some powers of resistance, whilst Bramley's Seedling and Cox's Orange proved very susceptible. Orchard heating was only partially successful, and the smoke from the oil heaters became a public nuisance. Some good crops were gathered in orchards in favoured sites, or where bees were used for pollination purposes. The study of the occurrence of frost pockets, and methods of orchard heating are now the subject of research at the Fruit Research Station, East Malling, Kent.

Marketing. In England the formation of small groups for marketing purposes (see *Ency. Brit. Book of the Year*, 1938) was further developed during the year by the formation of a marketing group in Worcestershire and another in Kent. Large packing-houses and stores have been erected in Kent and Essex.

New Planting. New plantings in England are confined to dessert apples and dessert plums and pears. At present only about twelve per cent of the pears are home grown and an expansion of the home industry is desirable and possible. Varieties planted include Laxton's Superb (early), Williams Bon Chretien, and Conference. Research work has yet to indicate precisely the most profitable stocks for pears and also the more efficient sprays.

The National Fruit Trials, Wisley, England, have shown the merits of such new dessert apples as Lord Lambourne, Ellison's Orange, and Laxton's Superb, and these with Worcester Pearmain and Cox's Orange Pippin are being planted.

Small Fruits. In all countries many stocks of strawberries are infected with virus disease and give unsatisfactory yields. Schemes are in existence for the multiplication in isolation and distribution to the strawberry growers of proved healthy plants. A large part of the Union of South Africa has an excellent climate for citrus fruit, and orange soils are found in parts of the Cape, Transvaal, and Natal, near the sea coast. The land is usually irrigated with water. Lack of concentration of the industry has increased the difficulty of preparation and assembly for market.

The South African orange comprises the Washington Newel and the Valencia Late and the Naartjes (tangarine) The fruit before shipment is subjected to a rigid system of government inspection. The trees are still young, and exports should increase.

Bananas. The banana stands third (apples and oranges rank first and second) on the list of the popular fruits of English people, and it is estimated that 15·2 lb. per head are eaten, all of which are imported, the principal sources being the West Indies, 86 per cent ; Brazil, 8·2 per cent, and the Canary Islands, 2·1 per cent.

The trade has much altered in recent years. Supplies from Central America and the Canary Isles have declined, and are now not very important, whereas those of the West Indies have shown remarkable development. This success has been assisted by the work of research scientists at the Imperial College of Tropical Agriculture, Trinidad.

Pineapples. For Europe, the most important areas of production of pineapples are the Azores, where fully 75 per cent of the fruits for England are obtained. In recent years South Africa has also developed a trade. The trade in canned pineapples is, however, more important than the trade in raw fruits. Imports of canned pineapples into Great Britain alone exceed a million cwt. annually, and show constant increases. The chief source of supply of canned pineapples is Malaya (over 900,000 cwt.) ; smaller sources being the U.S.A., Hawaii, and Japan. In Malaya the area planted is over 50,000 acres, the chief areas being Johore, Singapore, and Selangor, and both production and

South African Railways and Harbours]

THE PACKING SHED OF A SOUTH AFRICAN FRUIT FARM

canning is organized by the Chinese. The chief varieties grown are of the Queen type. Labour is adequate and inexpensive and most operations are done by hand.

South Africa. South Africa has now established for itself a fruit industry of real importance. The citrus fruits have been dealt with in the citrus section, but there is an important industry in deciduous fruits—apples, peaches, plums, pears, and grapes. These fruits are gathered towards the end of the year, and are marketed in Europe from December to May, after most of the home supplies have all passed into consumption. Much of this fruit is used in the towns and canning factories of South Africa. The best quality, however, is sent to the English markets. In 1937, the last year for which statistics are available, South Africa exported:

Apples	22,000 cwt.	Peaches	27,000 cwt.
Grapes	176,000 ,,	Pears	140,000 ,,
	Plums 78,000 cwt.		

in addition to 54,000 cwt. of canned and bottled fruits.

The majority of the trees have not yet reached full maturity, and further expansion will undoubtedly be made. This young industry is full of hope.

Fruit Soil Surveys. Successful fruitgrowers have long realized the suitability or unsuitability of different soils for fruit production. This has led to the initiation in many countries of fruit soil surveys, which aim at gaining precise information concerning soils on which fruit is produced and their correlation with either good, moderate, or bad crop performance.

In England reports have been published by H.M. Stationery Office of the Wisbech soils, the Greensands of Kent, the old Red Sandstone of Worcestershire and Hereford, etc., and now the Commonwealth of Australia have published an account of the soil survey of the fruit soils of the Murrumbidgee, *i.e.* areas of New South Wales. In all places the success or failure of soils to produce satisfactory fruits seems to depend more on their types, their depths, and water-holding capacity than on their actual chemical constituents. (H. V. T.)

FUELS: *see* COAL; GAS; PETROL; PETROLEUM; SYNTHETIC FUELS AND LUBRICANTS.

FURNITURE INDUSTRY, THE. Greater activity in most European furniture markets during the early part of 1938 was followed by a reactionary movement. The unsettled international situation reflected seriously on the public purchasing of furnishings, particularly in markets where a large proportion of this merchandise is bought on hire-purchase or deferred-payment terms. In Britain, some eighty per cent of furniture is sold on these systems, and the public were disinclined towards the end of the year to commit themselves to long-term payments which they might not be able to meet in the event of hostilities.

Hungary maintained her lead as the biggest furniture exporter, sending £45,000 worth during the first six months to Britain alone. Poland and Czechoslovakia, specializing in bentwood furniture, had exports to Britain of £42,000 and £24,000 respectively. British exports during this period, however, at £203,285 almost balanced imports at £207,891.

There was a steady change in public taste towards a return of the classic period styles in furnishing. This was particularly noticeable among the younger generation who, tiring of ultra-modern forms, turned to the traditional beauty of the seventeenth- and eighteenth-century styles. This movement had a beneficial effect on the markets, since it tended to make values rise in proportion to the improved craftsmanship necessary in translating period furniture designs. At the other end of the trade, however, values fell considerably.

Slum clearance in Britain had a strong effect on the furnishing industry. New council houses meant new furniture, but a considerable proportion of the new business was lost to the retail trade through municipal authorities buying furniture from manufacturers and supplying their tenants direct.

A new Hire-purchase Act, operating from Jan. 1, 1939, regularizes the system, and will have a healthy effect upon furniture merchandizing methods. (L. L.)

FURS. Generally speaking business in the fur trade in 1938 declined below that of 1937. The London and Paris fur markets were depressed by the political crises. In North America skin prices were lower, having dropped 20 per cent to 50 per cent in the winter of 1937–38. There was slow recovery during the year in the values of certain wanted furs, namely skunk, muskrat, mink, kolinsky, caracul, red fox, and Persian lamb. There was a new demand for novelty furs, such as marmot, guanaco, blue fox, lynx, fitch. Silver fox was a favoured fur, but increased production depressed prices to new low levels. Rabbit fur declined in consumer demand. Short coats of bulky furs were fashionable, and brown or sable shade was a favourite colour. Exports of furs from China declined to about 75 per cent of normal because of the Japanese occupation of that country. The consumption of Russian furs was well maintained in the European and American markets, but was somewhat less than in 1937.

Russia, Canada, Australia, and England are the chief countries supplying the United States with furs. The Anglo-American trade agreements reduced the import duty on silver fox from 50 per cent to 37½ per cent and the duties on dressed furs, with certain exceptions, from 25 per cent to 15 per cent and on dyed furs from 30 per cent to 20 per cent. These lower duties applied on all "most-favoured-nations" agreements.

During the year about 400,000 ranch-bred mink skins were produced in the U.S.A. and Canada, a gain of 25 per cent over the previous year and the highest on record. World silver fox production reached the 1,000,000 skins mark.

G

GAMBIA, THE. The Gambia consists of the Colony and a Protectorate of four provinces The people are largely dependent upon the export of ground nuts, which form 95 per cent of the export trade The Colony is faced with a trade recession as compared with 1937, and efforts are being made to develop the export trade in hides, palm oil, and other products. The eradication of rinderpest is assisted by the Colonial Development Fund. In 1938 an air service started between Bathurst and Freetown The Colony is unhealthy. A hospital costing £20,000 was opened in April, and a comprehensive drainage scheme is under consideration for Bathurst. (J. L. K.)

Area and Population :
Area 3,999 sq miles.
Population (est. Dec. 31, 1936) 190,739.

GAMELIN, MARIE GUSTAVE (1872–), French general ; born in Paris, son of a general, he was educated at St. Cyr, was chief of staff of General Joffre in 1914, played an important part at the battle of the Marne, and was promoted general of brigade and commander of a division in 1917. After the War he was head of a military mission to Brazil until 1925, when he was appointed commander of the French forces in the Levant. He became chief of the general staff in 1931, inspector-general and vice-president of the higher council of war in 1935, and in 1936 went to Poland for discussions with General Śmigły-Rydz. In Jan. 1938 he was nominated supreme commander of all French forces. In that capacity he was responsible for the partial French mobilization that took place in September during the German-Czech crisis when, in a report to the prime minister, he expressed the view that France, despite several shortcomings in her military preparedness, should intervene. He accompanied MM. Daladier and Bonnet to London during that crisis and held conversations with the British general staff. On the occasion of the Paris visit of the British Sovereigns in July, General Gamelin received the G C.V. O.

GAME SHOOTING. While, as far as the British Isles are concerned, there is nothing outstanding to report regarding the 1938–39 season, it can be said that some very fair sport with grouse, partridges, and pheasants was enjoyed. The exceptionally fine weather in March induced early laying, and many broods were too far advanced to be adversely affected by the inclement weather which was experienced later in the year. In wildfowl and rough shooting, though ducks were generally scarcer, geese seemed to frequent the shores of Britain in undiminished numbers ; and rabbits and pigeons were again sufficiently numerous to be considered a nuisance in many districts. The Scottish deer-stalking season produced some respectable " heads ", especially in forests where winter feeding was practised. In some European countries considerable attention has been given to methods of preservation, and in Egypt the value of duck shooting as a tourist attraction is being more fully recognized. (W. H. T. L.)

A SHOOTING PARTY ON A SCOTTISH GROUSE MOOR

GANN, THOMAS (WILLIAM FRANCIS), British explorer, was born at Murrick, County Mayo, in 1868, and died in London on Feb. 24, 1938. Educated at the King's School, Canterbury, and the Middlesex Hospital, London, he was in charge of the expedition sent to relieve sufferers from the Guatemala earthquake, and later was chief medical officer in British Honduras. As a keen archæologist, his explorations enabled him to locate several centres of the ancient Maya civilization ; and he lent his experience to the expeditions sent to British Honduras by the British Museum in 1926 and 1928. Among his many publications were *Maya Cities—a Record of Adventure and Exploration in Central America* and *Mystery Cities of Honduras*.

GAS. The part that the production and utilization of gaseous fuel plays in the social and economic scheme is receiving yet closer attention in many quarters, and the importance of a rational utilization of fuel resources is becoming more widely recognized. In Great Britain emphasis is placed upon the betterment of living conditions

Gas Light & Coke]
OVERHEAD RADIANT PANEL HEATER AT KENSAL HOUSE NURSERY SCHOOL, LONDON

which is made possible by the wider use of coke and gas, the products of coal carbonization, and particular interest is being displayed in the possibilities of developing the use of these fuels as a means of removing the smoke nuisance. Conservation of coal supplies and the production of important raw materials for industry are incidental advantages to which increasing recognition is being given. The contribution made by the carbonizing industries to the national requirements of motor fuel amounts to some four per cent of the total quantity used, and the gas industry is giving thought to the possibility of increasing this figure by modified methods of coal processing. Natural gas forms nearly eighty per cent of the total gas sold in the United States of America, and the rapidly growing use of gaseous fuel in that country is attributable to its great convenience and efficiency in use, but there are those who would draw attention to the limited life of this source of fuel supply and point out the importance of maintaining and developing the manufactured gas industry. In Germany the development of the gas industry is a concomitant of the great efforts being made to expand the output of iron and steel. The erection of new coking plants is making more gas available and industry is absorbing almost the whole of the increase.

The political and economic arguments which would favour the extension of the activities of the gas-producing industries are of little interest to the public in general, the individual members of which are more directly concerned with the comfort and convenience which gas service can bring them. This fact is well recognized by the gas supply industries, and large changes have been made in the design of appliances with the object of making them more efficient, not only thermally but also in the performance of their particular duty, and more attractive. Increased importance is being attached to uniformity in performance, and this necessitates more careful standardization both of the appliances and of the quality of the gas supplied. Gas quality, in its modern sense, refers to much more than the calorific value alone, and it is recognized to-day that satisfactory performance requires control of the calorific value, the specific gravity, the air requirements, and the speed of flame propagation in admixture with air. In the United States of America the tendency is to judge the combustion characteristics of a gas by calculation from measured physical properties, but in Great Britain and Germany there have been introduced test burners intended to give direct measurement of the resultant of the various factors involved. The matter of safety of appliances in use continues to receive the most careful consideration, and increasing care is taken to make appliances safe by design rather than to rely upon the reasonableness of the user In this connexion the British Standards Institution has issued specifications for combustion standards with which gas appliances should comply, and for bafflers and flue-pipe terminals used in connexion with gas appliances.

Reviewing the more obvious changes which have taken place in domestic gas appliances during recent years, it is notable that cookers show greater speed in boiling and in grilling, while the thermal efficiency of the oven is distinctly higher It is now customary for all but the lowest-priced cookers to be provided with oven thermostats, and safety taps are coming into general use By the wider use of vitreous enamel and by ingenious design, their appearance has changed to conform with the most up-to-date conceptions of neatness and cleanliness

Water-heating appliances show an equally striking advance, and the term "geyser" is no longer applied to the modern instantaneous water heater These heaters are made to supply hot water either at one or at a number of points and are fitted with automatic controls on both the water flow and the pilot jet An interesting recent development is an instantaneous heater which supplies, at will, warm, hot, or even boiling water. There has been an equally great advance in the storage type of water heater, and the numerous designs available range from small storage heaters for the sink or wash-basin to the large appliances employed for heating the circulated water of swimming-pools.

Space heating, or house heating, forms one of the major undeveloped markets for gaseous fuel, and in both Great Britain and the United States of America efforts are being made to develop this field. Climatic differences make a difference to the type of appliance required, and while central heating boilers or air heaters are in demand in America, the radiant gas fire predominates in Great Britain. Close study of requirements has resulted in fires which give a far higher degree of comfort with a high thermal efficiency, while self-lighting devices and coloured finishes add their attraction. For public buildings and factories, overhead radiant heaters and air heaters are gaining in popularity and, in Great Britain, gas lighting in factories justly retains favour partly on account of the useful heating effect which it provides.

The direction in which the greatest expansion in gas sales is taking place generally is the use of gas for industrial furnace work. The rapid developments in this field have necessitated an intensive study of combustion conditions, refractory materials, and furnace atmospheres, and a vast amount of experience has now been gained and is being applied in multitudinous processes.

GEMS AND PRECIOUS STONES: *see* MINERALOGY

GENETICS. In the field of human heredity an important advance in the analysis of mental defect is made in the British Medical Research Council Report by Dr. L. S. Penrose of his six-year study of 1,280 patients of the Eastern Counties Hospital and their families. The overwhelming importance of hereditary factors is made plain, but the importance of various non-hereditary influences, particularly in determining the degree of defectiveness is also clear. There is evidence of both dominant and recessive genes and also multiple factors, or else fluctuating dominance, being involved in various cases. Relatives of moderately sub-normal patients are very often of similar

grade, as expected if the condition is due to multiple or incompletely dominant genes, whereas idiots and imbeciles are more apt to come from normal parents, as expected if they are due to single recessive genes or new mutations. A great excess of defective mothers relative to defective fathers of defectives is noted, and a slight similar tendency for grandparents. This is interpreted as a non-genetic difference due to non-random sampling.

Applied Genetics. Recently Goodale[1] has shown by mouse experiments that selection by the progeny-test method may have far greater possibilities than is commonly recognized for animal breeding in general. Starting in 1930 with a commercial strain of rather large albino mice he has used as parents in his selected strain those mice which, regardless of their own size, have, in a preliminary mating, produced larger offspring. In twelve to sixteen generations he has increased the average weight by about forty per cent and the increase is still continuing

In a recent arresting address[1] the United States Secretary of Agriculture, H. A. Wallace, discussed breeding principles that have emerged from genetic studies of maize and indicated their significance for farm-animal breeding in which genetic analysis is necessarily slower. The highest yields of maize are obtained from seed produced by crossing rather widely different strains that have themselves been inbred for many generations. The wider extension of this principle to animal breeding is now being urged Before the genetic effects of inbreeding and outbreeding were understood this practice was a dangerous one as the important differences between "top-crossing" and random crossing were rarely fully realized. If it now becomes a general practice, extensive dissemination of the salient genetic facts to breeders and farmers in general will be necessary. The United States Department of Agriculture has made notable contributions to this end in its last two year-books. Important changes in show-ring standards will also be involved.

Physiological Genetics. Goldschmidt's *Physiological Genetics* is the first extensive work of its kind in English It lays a foundation for studies in this rapidly expanding field. Kühn, Beadle, Ephrussi[2], and others have obtained further knowledge of gene action and tissue interrelation through transplantation experiments in the flour moth Ephestia and in Drosophila. Willier, Rawles, Reed, Danforth, Twitting, and others have done similar work on mammals and birds. Wettstein and Went are applying to plants the physiological methods previously limited to animals. Oehlkers and his students have made further important contributions to the physiology of meiosis.

General Genetics and Cytogenetics. Of the numerous advances only a few can be mentioned. McClintock has published exhaustive analyses of the behaviour of ring chromosomes, and of fragmentation in maize. Sax has made an analysis of X-ray effects on Tradescantia which shows clearly that X-rays are too crude a tool for the final determination of the number of longitudinal divisions within a chromosome. The differential effect of ultraviolet and X-radiations of diverse lengths has been shown by Stadler. Spermatocyte chromosome pairing without chiasmata and in the absence of somatic pairing has been demonstrated in a mantid by White. From numerous studies it has become clear that genetically inert parts of chromosomes have generalized instead of specific pairing capacities. Kuwada, Matsuura, Huskins, and others have continued their observational-experimental studies of the spiral structure of chromosomes. Berger[1] has shown that somatic multiplication and reduction of chromosome sets is correlated with metamorphosis in mosquitoes, and Love has found abnormal somatic reduction occurring in hybrid wheats. A second edition of Darlington's *Recent Advances in Cytology* records primarily the great extension in cytogenetic theory and hypothesis achieved by the deductive method Dobzhansky and Queal have analysed chromosome variation in populations of *Drosophila pseudoobscura* inhabiting isolated mountain ranges and have found three inversions within the third chromosome to be present in every population. The method of analysis provides an unusually reliable criterion of relationships. Babcock, Stebbins, and others have made further cytosystematic analyses of Crepis, Pæonia, and Youngia. E. G. Anderson has begun publication of extensive experiments on translocation in maize. S. Emerson has shown that self-incompatibility in *Oenothera organensis* is governed by a series of alleles similar to those determined by East for Nicotiana. Studies of the fungus Neurospora by Lindegren continue to show the occurrence of "chromatid interference" in crossing-over Contributions to theories of natural, artificial, and sexual selection have been made by Wright, Fisher, Haldane, Sturtevant, Huxley, Mather, and others. Sturtevant's "On the Effects of Selection on Social Insects"[3] warrants consideration by sociologists. He shows that selection operates on at least three different levels · "On the individuals, on the colonies, and on the population within an area". Selection acting on man is certainly not less complex. A symposium on the mechanism of evolution was held during the B.A.A S meeting at Cambridge[4]. A recent special issue of the Indian journal *Current Science* was devoted to genetics. The genetics of Drosophila, particularly through salivary gland studies and irradiation, has advanced so extensively that no brief account can be given. Amongst numerous studies on the genetics of disease resistance Wellhausen's demonstration that the virulence of the Phytomonas bacteria is changed when they are grown on inbred lines of maize varying in susceptibility or resistance may be cited. Stubbe has published the first section of a comprehensive *Handbuch* on gene mutation. Correns' last work, a *Handbuch* on plasmatic inheritance, has been edited and extended by von Wettstein. (C. L. Hu.)

GEOLOGY. The geology of over nine-tenths of the earth's surface is now known in at least broad outline, and the regions concerning which we have little or no accurate information and no geological maps are becoming relatively few. If we exclude the polar ice-covered areas, these unknown territories include principally the great central desert of Australia; part of the interior of New Guinea and Borneo; the highlands of Abyssinia and much of adjacent British Somaliland; the Rio de Oro coast of West Africa; and, in Asia, the northernmost part of Kamchatkan Siberia, part of Afghanistan, large regions in western Mongolia, and about three-quarters of the Himalayan ranges in India and Tibet. Much recent work on the Kashmir, Simla, and Garhwal Himalayas has been executed by the Indian Geological Survey, who find in these regions great *nappe* structures on the plan of those of the Alps. Himalayan tectonics, however, appear generally to be simpler than Alpine, despite the much more tremendous scale of the structures involved. A full review of these and other investigations on the tectonics of the Himalayas and the

north Indian foreland is given by Wadia in his presidential address to the geology section of the 25th Indian Science Congress (Calcutta, 1938). Other considerable advances in Asiatic geology are seen in the reports of the Sino-Swedish expeditions to the north western provinces of China (1927-33) under the leadership of Sir Sven Hedin. These monographs describe the geology of western Qurug Tagh (Eastern T'ien Shan) and the late palæozoic rocks of Tun Huang. Valuable compilations on African geology by Hennig, Krenkel, and Haughton have also appeared during the year. Progress in the other unmapped areas previously mentioned is naturally slow, and although every year some 8,000 geological pamphlets, books, and maps are received in the main European and American libraries, almost the whole of this vast literature is concerned with the geology of civilized lands. Some of the more important advances are noted below.

Stratigraphical Geology. With increasing stratigraphical knowledge, it would seem that major transgressions of strata, indicated by progressive overlap, occur at essentially synchronous stratigraphical levels in all the continents, while major regressions are also of fundamentally concurrent occurrence throughout the world. In other words, throughout geological time there appears to have been a rhythmic rise and fall of sea-level, due, perhaps, to a rhythmic oscillation of the sea-bottom. This doctrine, that of the Pulsation Theory first postulated at the International Geological Congress at Washington in 1933, is in direct contrast to the orthodox and hitherto widely held hypothesis of oscillation, according to which the movements of the continental land-masses are more or less localized. In support of the Pulsation Theory and in explanation of its repercussions on tectonics and palæontology, a very full study of the Lower Palæozoic geosynclines throughout the earth has been commenced by Grabau, whose compilations include much information on the geology of remote areas, particularly of western Asia, not hitherto available in European languages. Whatever the outcome of the hypothesis, these must now form a standard reference work for stratigraphers.

Physical Geology. In the field of physical geology one of the foremost present-day problems is that of soil erosion. Following upon over-intensive agriculture, some 900 million acres in north-western and north-central United States have become almost wholly denuded of any topsoil, forming the region commonly known as the Dust Bowl. Similar or closely related problems are being faced in South Australia, India, the French Sudan, Kenya, Nigeria and other African colonies, and much co-operative investigation is presently being carried out by the geologists, pedologists, and agriculturists of the countries affected.

In glaciology, the outstanding advance of the year has been the publication of the investigations in the Karakorum and neighbouring mountain ranges carried out by four Dutch expeditions from 1922 to 1935. The glaciers of the Karakorum, many of which were hitherto unknown, cover an area of close on 14,000 sq. kms., and the scale of the phenomena studied can only be surpassed in Polar regions.

Economic Geology. More geologists are engaged in the exploitation and exploration of oilfields than in any other branch of the mining industry; and these, as well as students of general economic geology, will find of outstanding interest a recent compilation by 316 authors on the science of petroleum. This work of over 3,000 pages includes much new information on the structure and stratigraphy of the oil-belts of the world, written by the leading geologists in these fields; and it summarizes the complex modern methods of geological and geophysical prospecting used in oil exploration. Throughout the world this exploration is being carried on, with increase of boring technique, at ever-increasing depths, and early in 1938 there was completed the deepest bore yet drilled in the earth's crust—a depth of 15,004 ft., at a site in the San Joaquin valley, California. Borings over 10,000 ft. in depth are now common in many oilfields, and from these much new information on geothermal gradients in various geological formations and structures has become available. Within the British Empire geological surveying for oil is being expedited in Australia, New Guinea, Papua, Uganda, and elsewhere, without as yet much pronounced success, while in Great Britain prospecting by various companies under the Petroleum (Production) Act, 1934, has not yet yielded oil in commercial quantities, though an extensive gas field has been discovered in the Lothians.

The development within the past few years of an extensive deposit of pitchblende, on the shore of Great Bear Lake, Canada, some forty miles south of the Arctic Circle, is of international importance. The area is part of the great Pre-Cambrian Canadian Shield, and the radium-uranium ores are associated with a rich silver mineralization. This is the first major discovery of pitchblende since the domination of the world's radium supplies by the Belgian Congo deposits, beginning in 1923, and by increasing geological and technological development, carried on despite climatic difficulties, the Canadian output has led to a fall of at least 25 per cent in the world price of radium. Production in 1938 was expected to yield 85 grams of radium, which is 15 per cent of the radium known to be in use throughout the world.

The exploitation of olivine or olivine-rock (dunite) during 1938 introduces a new mineral to the field of the economic geologist. Hitherto olivine, when not of gem quality, had no commercial value; but it is now employed both in Europe and America in the manufacture of forsterite bricks which, because of their high melting-point (over 1,850° C.) and other physical characteristics, are eminently suitable for many refractory purposes. (C. F. D.)

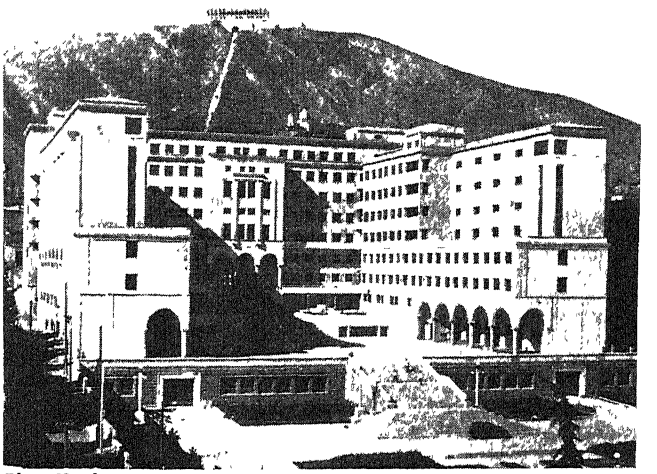
GEORGE VI (1895–), King of Great Britain and Ireland; second son of King George V, he married Elizabeth, daughter of the Earl of Strathmore, K.G., on April 26, 1923, and ascended the throne on Dec. 11, 1936 (see *Ency. Brit. Book of the Year*, 1938, p. 278).

His Majesty fulfilled many State engagements during 1938, of which the most important was his visit, accompanied by H.M. the Queen, to the French capital in July. Originally fixed for the end of June, the visit was postponed on account of the death of the Countess of Strathmore, Her Majesty's mother, on June 23, and it took place amid scenes of great enthusiasm from July 19 to 22. At the commencement of the visit their Majesties witnessed the unveiling by Marshal Pétain and F.-M. Lord Cavan of the Britannia monument erected on the mole at Boulogne in honour of the British troops landing there during the World War, and at its close the King unveiled the Australian War Memorial at Villers Bretonneux. Other state functions included in-

vestitures in February and July, levees in March, and Courts in May and July, the opening of the Empire Exhibition at Glasgow on May 3; a visit to the Home Fleet in June, and the launching of the "Queen Elizabeth" on the Clyde on Sept 27, though this ceremony was carried through by the Queen alone, the King's presence not being possible owing to the international situation



Topical Press]
HIS MAJESTY KING GEORGE VI

His Majesty again on numerous occasions showed his great interest in the welfare of his people. On Feb. 17 he inaugurated, by means of a speech broadcast from the Guildhall, the National Fitness Campaign; in March he visited "shadow" factories in Birmingham and Coventry and housing estates in South and East London; he held an inspection of King's Scouts at Windsor Castle in April, and after the opening of the Glasgow Exhibition toured the mining and working-class districts of the Clyde, later in May making a four-days' tour of the Lancashire towns. A slight illness in July prevented his opening the new hospital centre at Birmingham (a duty performed by the Duke of Gloucester), but he had recovered by the time of the Paris visit; and thereafter had a holiday in Scotland, spending one day—as is his annual custom—at his boys' camp at Southwold. The September crisis caused a break in his holiday from Sept. 14 to Oct. 2, when he was in London; and soon after his final return he received the governing body of the International Labour Office (Oct 24) and opened at Norwich the new City Hall (Oct. 29).

The King's interest in sport was well exemplified by his attendance at the Derby, Ascot, the Braemar Games, the Cup Final at Wembley and other football matches on his various tours, and by his presenting the prizes to the London Federation of Boys' Clubs' boxing champions on March 2 at the Albert Hall.

It was announced in February that His Majesty's visit to India for a Coronation Durbar was at present in abeyance, and in October that he and the Queen would spend three or four weeks in Canada, and visit the United States, in the summer of 1939.

GEORGIAN S.S.R. On June 12, 1938, the elections to the Supreme Council of this Republic of the U.S.S.R. took place, at which 99·2 per cent of the electorate recorded their votes. In the capital, Tbilisi, the percentage is said to have reached as high as 99·9. The result was that 237 candidates from the communist and non-party *bloc*, 59 of whom were women, were elected. At the first session of the Council in Tbilisi, from July 8 to 11, after exhaustive discussion and criticism of the individual branches of administration, the new government of the Republic under Valerian Bakradze was formed. The purge of the Republic from the alleged wreckers and saboteurs was continued

Power capacity, 147,000 kwh.; output of electric power, 471·7 million kwh.
Budget (1938) 1,069 million roubles
Invested in road construction (1928–37), over 337 million roubles.

Cultural Life 1937:
Education: expenditure, 400 million roubles; elementary and secondary schools, 4,249 (660,284 pupils); higher educational institutions, 19 (*c.* 22,000 students); technical colleges, 200 (32,373 students); workers' faculties, 21 (4,528 students).
Museums, 28; libraries, 1,326; theatres, 40; cinemas, 487; daily newspapers, *c.* 100; books published (1935–37), 1,113 (over 15,000,000 copies). (S. YAK.)

GERMAN LITERATURE. It will be evident from the present survey that, though Germany is no more self-sufficient in the literary than she is in the economic sphere, yet in some directions she has during 1938 gone her own way. Official criticism is directed to definite aims: to further the consciousness of race, of mutual solidarity, family tradition, historical continuity, and pride in the greater Germany. There is a revulsion of feeling against "decadent tendencies" like those apparent in the works of

Thomas Mann, and the internationalism and pacificism of the Expressionists are things of the past. The domestic virtues are to the fore woman is wife and mother rather than mistress; and man, if no longer clothed in field grey, takes a manly, not to say an heroic, view of life The ideal is "a poetry born of strength and faith", and modern Germany has turned her back on the liberal, individualist, rational view of life bequeathed from the French Revolution, in order to glorify the romantic notions of instinct, faith, and feeling. Unfortunately, modern romanticism lacks the "irony" so distinctive of that former brilliant epoch of German letters, that saving grace of humour which enables a man and a nation to rise superior to themselves, whether in transitory setback or permanent success. The earnest note which predominates in all the creations of the German mind tends to pall on those who do not subscribe to the Nazi way of life.

Whereas in France and England the novel has lost in prestige as it has increased in popularity, in Germany they still speak of it as "an epic poem", and describe its author as a "Dichter". Of the half-dozen outstanding German novels of 1938 there is scarcely one which has not a serious purpose more or less clearly expressed.

Pride of place undoubtedly belongs to *Das gottgelobte Herz*, of E. G. Kolbenheyer (Langen-Muller), both by reason of the author's leading role among the writers of modern Germany and because of the weightiness of its contents. It treats with complete poetic mastery of the dedication of a German nun of the fourteenth century to the service of Christ. As a former novel had culminated in the mystic vision of Böhme in *Meister Joachim Pausewang* (now available in a masterly English rendering as *A Winter Chronicle*), so now the threads of this novel all lead to the central figure of German mysticism, Meister Eckhart, who is revealed as the first German Protestant in spiritual conflict with the French pope of Avignon. There is no doubt of the author's sincerity and capability, but the reader is likely to find greater enjoyment in the stirring events of the first half of the novel than in the mystic outpourings of the second.

The theme of the second great novel of the year, Ina Seidel's *Lennacker: Das Buch der Heimkehr* (Deutsche Verlagsanstalt), is the continuity of life through the family. A young demobilized officer spends the Christmas of 1918 with an aged aunt, the superior of a Protestant convent. He falls ill, and his fevered brain has twelve visions of his ancestors who, with one exception, have all been Protestant pastors. It is a relation of moving episodes told without trace of sentimentality and informed by genuine feeling and pious reflection, based on those Protestant traditions which have always provided German literature with its most precious inspiration.

It is a steep descent from these heights to the pedestrian, if competent, work of less-inspired writers. Most of them have open or hidden propagandist intentions: H. F. Blunck's historical (or rather pseudo-historical) novel *Wolter von Plettenberg* (Hanseatische Verlagsanstalt) is a glorification of the German Order against the superior might of the Russian Tsar. Werner Beumelburg's *Der König und die Kaiserin* (Stalling) emphasizes the tragedy which drove Frederick the Great and Maria Theresa, both ardent patriots, to oppose one another in disastrous wars. Gertrud Bäumer, in *Der Berg des Königs* (Bruckmann), seeks to clear the Lombards of the charge of barbarism which historians have fastened upon them. Heinrich Zillich lays the rather commonplace plot of *Der Weizenstrauss* (Langen-Müller) in his native Transylvania, but fails to repeat the success of *Zwischen Grenzen und Zeiten*. E. Wittstock also chooses Siebenburgen for the setting of a collection of humorous tales—... *Abends Gäste* (Langen-Muller), but their ponderous jesting will not be to everybody's taste The cause of the South Tirol is kept discreetly alive by *Das Sterhorn* of J G. Oberkofler (Diederichs), a quasi-religious avowal of belief in race and home. *Der Weg der Anna Illing*, by Emil Merker (Diederichs), symbolizes in the sufferings and sacrifice of an individual the devotion of the Sudetendeutschen to the cause of the greater Fatherland

The foreign reader turns with relief from these officially sponsored productions to the frank sentimentality of *Die Mutter*, by Ottfried Graf Finckenstein (Diederichs), and accepts it as a true picture of conditions in East Prussia during the inflation period. In *Die Verlobten* (List), Margarete Schiestl-Bentlage unravels the complicated relations of six peasant families of her native Westphalia. *Der Steinbruch* (Langen-Muller), by Joachim von der Goltz, tells a straightforward story of guilt and expiation against a background of Black Forest uplands. Gertrud von Le Fort invests the horrors of *Die Magdeburgische Hochzeit* (Insel-Verlag) with purely human interest. Nor have the short stories of G. Britting, *Das gerettete Bild*, or of P. Alverdes, *Die Verwandelten* (both Langen-Müller), any ulterior motive beyond delighting the reader with their skilful telling

How far does the German public read what it is told? Official critics complain that the bookshops still "overflow with foreign rubbish", and *Gone with the Wind* and *The Citadel* have probably found as many readers in their German translation as all these orthodox novels put together. As in the West, biography and memoirs occupy a large place in popular estimation: Isolde Kurz, *Die Pilgerfahrt nach dem Unerreichlichen* (Rainer Wunderlich) is a good example of the first; Fritz Pick's adaptation of Sir Austen Chamberlain, *Englische Politik* (Essener Verlagsanstalt), is typical of the interest which is accorded to all things English.

National-Socialism is particularly concerned at its failure to inspire a really first-class dramatist. Of all the institutions in the new Germany the theatre has changed least, and the public still insists on being amused. In the serious theatre the historical drama is still to the fore, with Napoleon and Frederick the Great almost equal in popular favour. Many competent plays by reputable authors (Blunck, Rehberg, Frenssen, von Trotha) pass over the stage, but leave no permanent trace behind. German critics are unanimous in acclaiming *Der Hochverräter*, by Curt Langenbeck (Langen-Müller), as the play of the year; but English-speaking readers will not readily accept his idea of an American "Volksstaat" united under the sovereignty of the English king. So far dramatists have been content to exhibit the national resurgence symbolically through the past, and none has succeeded as yet (as Kolbenheyer has in the novel) in creating a dramatic record of a Greater Germany. Perhaps Shakespeare (who is as popular on the stage as ever) satisfies German aspirations in this respect. And again, well-tried foreign plays, Shaw's and Wilde's, render superfluous attempts at literary comedy like *Das Meistermädchen* of von der Goltz (Langen-Müller).

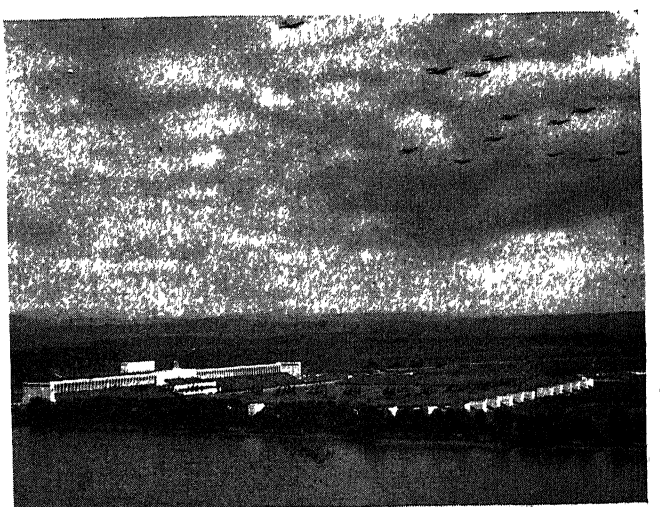
Even the lyric is not entirely free from extraneous influences. Josef Weinheber's new volume, *Zwischen Göttern und Dämonen* (Langen-Müller) is inspired by an heroic conception of life which will not appeal to the more indulgent. But the most captious critic will have no fault

to find with the form of these forty monumental odes. Gerhard Schumann is a prominent member of the Party, and his verse is tinged by political considerations. The title, *Schau und Tat* (Langen-Muller), indicates that poetry implies no idle contemplation of life but a call to action. Anthologies of patriotic verse have been published by Staackmann in Leipzig, *Das Reich*, and Diederichs in Jena, *Dom aller Deutschen*.

A very different spirit animates the poetry of Hermann Claudius, and *Jeden Morgen geht die Sonne auf* (Langen-Muller) makes the eternal appeal of nature revealed as the "living garment of God". Ruth Schaumann, in *Der Siegelring* (Grote), has again proved herself a skilful painter of moods and fancies Wilhelm Pleyer sings of a Fatherland now united to the greater Reich in *Lied aus Böhmen* (Langen-Muller).

This sketch would be incomplete without a brief reference to the literature of German Switzerland, now the only independent German community outside the Reich. Switzerland's reaction to its powerful neighbours is shown by this year's most successful novel, *Schweizerspiegel*, by Meinrad Inglin (Staackmann). It mirrors the vicissitudes which befell a typical Swiss family during the fateful years 1914–18, when Switzerland stood on the armed defensive between East and West. He who would see modern Germany through Swiss eyes should read *Das Reich ohne Mitte* (Oprecht) by B Diebold, a former critic of the *Frankfurter Zeitung*. In drama and lyric there was no outstanding performance.

There remains the not inconsiderable writings of the *Emigranten*, of figures of international repute like Stefan Zweig, Franz Werfel, Heinrich Mann, and many others whom race or political conviction have driven into exile. Though they have produced work of merit, the greatest of them, Thomas Mann, has been silent except for a volume of critical essays. Moreover, they already have the ear of the foreign public, and their works published in Amsterdam and Stockholm, are regularly reviewed in the international press. They represent a phase in German literature which, as far as the Third Reich is concerned, is of the past, and the object of this article was to delineate the present.



The following surveys have all been written since 1933 — A. Soergel, *Dichter aus deutschem Volkstum* (Leipzig, Voigtlander); H. Langenbucher, *Volkhafte Dichtung der Zeit* (Berlin, Junker und Dünnhaupt); W. Linden, *Geschichte der deutschen Literatur von den Anfängen bis zur Gegenwart* (Leipzig, Reclam); F. Koch, *Geschichte der deutschen Dichtung* (Hamburg, Hanseatische Verlagsanstalt); J. Beer, *Deutsche Dichtung seit 100 Jahren* (Stuttgart, Franckh); P. Fechter, *Die deutsche Literatur vom Naturalismus bis zur Literatur des Unwirklichen* (Leipzig, Bibliographisches Institut), Current literature is reviewed in the monthlies: *Die Literatur. Monatsschrift fur Literaturfreunde* (Stuttgart, Deutsche Verlagsanstalt), *Die neue Literatur* (Leipzig, Avenarius Verlag). (L. A. W.)

GERMANY. The first weeks of 1938 passed quietly in Germany, with less unemployment than usual; but a feeling of puzzled bewilderment spread amongst the people when the meeting of the Reichstag on Jan. 30, to mark the fifth anniversary of Hitler's power, was postponed. After a week of rumours, two decrees of Feb. 4 explained the situation. Drastic changes took place in the army. Hitler himself assumed the title of Supreme Commander of the Armed Forces; the post of War Minister was abolished; the functions of Field-Marshal von Blomberg were given to General Keitel (*q.v.*), who was to work under Hitler as Chief of the Supreme Command. General von Fritsch was replaced by General von Brauchitsch (*q.v.*) as commander-in-chief, and seven other army generals and six air force generals were retired. Herr von Ribbentrop was recalled from London to take Baron von Neurath's place as Foreign Minister, and a "secret inner council" was formed to advise Hitler on foreign affairs.

It transpired later that the displaced generals were those who had been lukewarm in supporting Hitler's expansionist plans in central Europe. The army purge, in short, was only a preparation for the *Anschluss* with Austria. Hitler had delivered an ultimatum to the Austrian Chancellor at Berchtesgaden on Feb. 12; and, after two more ultimatums on March 11, Austria was invaded at three points by German troops A law of March 13 made Austria part of the German Reich The mass of Germans, impressed by the gain of 6,876,000 new nationals and by the speed and bloodless nature of the *Anschluss*, looked upon this as an immense victory and supported Hitler in the subsequent plebiscite.

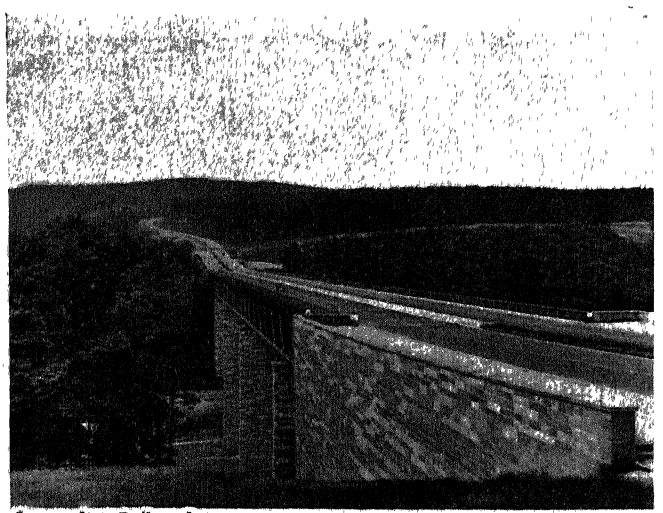
The second great *coup* of the year concerned Czechoslovakia In the Reichstag speech of Feb. 20, Hitler had referred to ten million Germans prevented from joining the Reich. A propaganda campaign, waged ceaselessly for six months, urged justice for the 3,250,000 Germans in Czechoslovakia In the first crisis of May 21, the Czech army was partly mobilized. Six months later, Dr. Goebbels revealed that "on May 28 the Fuhrer decided to settle the Sudeten problem this year" and "made his preparations accordingly". Germany constantly widened her demands. From regional autonomy she came to demand complete cession of all the districts with a German majority. Hitler's final terms were embodied in the Godesberg memorandum of Sept. 23, and, although the terms of the Munich Agreement of Sept. 29 were more favourable, Germany obtained practically all that she asked for at Godesberg. In the end she gained 10,800 sq. miles of territory, with 3,600,000 people, of whom 800,000 were Czechs; but, as in the case of Austria, the economic advantages were over-estimated.

It was against this menacing background of the Austrian and Czech crises that German internal movements occurred during 1938. All the emphasis was on the army and the Four Year Plan, in an attempt to prepare Germany for the "total" warfare of the future or, if that were avoided, to make her so strong that her demands would be granted without fighting. The most obvious item in this preparation was the strengthening of the armed forces. In 1935 Hitler had announced a force of twelve army corps, but a

Keystone]

THE ZEPPELIN FIELD AT NUREMBERG

fourteenth corps was formed after the January purge and, to the amazement of experts, the two new army corps drawn from Austria were designated the seventeenth and eighteenth. This brought the German army up to its pre-war numerical strength. The Army Year Book, published in November, gave the standing strength of the German army as a million men, organized in six army groups or eighteen army corps. During the year the Siegfried Line, a line of steel and concrete pyramids, was built along the western frontier. Flaws in mechanization revealed during the Austrian crisis were remedied during the summer, so that the occupation of the Sudetenland by thirty divisions (450,000 men) was a triumph of organization.



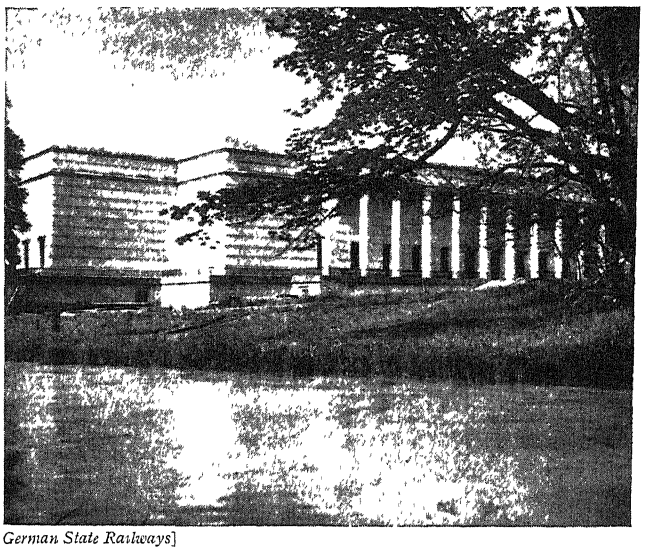
The air force was perfected as Germany's striking weapon. According to Field Marshal Göring's newspaper, Germany's front-line air strength at the time of the Munich Conference was 3,000 machines, and they are to be doubled by 1940–1. The fleet has also been increased. Three battleships of 35,000 tons are being built, as well as four large cruisers and ten submarines. Special emphasis is placed on two 10,000 ton aircraft-carriers, the first of which was launched on Dec. 8. In December Germany notified the British government, under the Anglo-German naval pact, of her intention to build up to 100 per cent of British tonnage in the submarine class, and a British naval mission flew to Berlin to discuss this. The second part of the scheme for national protection was the drive for economic self-sufficiency. In order to make Germany a self-contained fortress, all economic life was subordinated to the needs of Field-Marshal Göring's Four Year Plan. The year opened with important changes in personnel. Herr Walther Funk took over the duties of Dr. Schacht as Minister of Economics on March 5, and the ministry became the executive agent of the Plan. Its task was to centralize all economic life, practically on a war footing. In the Reichstag speech of Feb. 20, Hitler claimed that unemployment had been eliminated, that industrial production was still booming, and that tax-receipts were increasing. All of these claims were justified. Germany has undoubtedly achieved an armaments expenditure on a scale that would have been deemed fanciful a few years ago. She has doubled her industrial production in the last five years, and she has kept her people employed. The doubt raised during 1938 was whether the position could be maintained.

The labour shortage has become acute, especially since half a million workers were taken under the Labour Conscription Law of June to work on the western fortifications. Every employable person in Germany is working. In September only 156,000 were unemployed in Germany proper, less than ever before, and, even in Austria, the number of unemployed has dropped from 600,000 to 100,000. In addition, over 6,500,000 women now have jobs. The shortage is most marked in the skilled trades and in agriculture. It was only with the help of the army and the Nazi formations that the 1938 crops were harvested; agricultural labour was also imported from Italy. To cope with the problem, the length of apprenticeship was reduced; skilled labour was diluted by more and more unskilled workmen, attempts were made in the autumn to repatriate German emigrants from abroad; and Dr. Ley started an efficiency-drive to double the output of each factory-worker.

On the other hand, Germany experienced a shortage of raw materials, especially iron, and she found difficulty in selling enough goods abroad. Despite new trading-agreements with many countries, her unfavourable trade-balance for the first ten months of the year amounted to 210 million marks, as contrasted with a favourable balance of 443 million marks in 1937. One reason for this was that Germany was amassing sufficient reserves of war supplies to last her for a year of hostilities. In particular, her imports of mineral oils increased, despite enlarged production at home.

Hitlerite Germany has evolved an economic system of checks and controls, to secure the full use of reserves which are not usually mobilized in other countries except in war-time. The fullest use is made of capital and labour. Costs, investment, foreign trade are all controlled. Many striking results have been produced by the system: the main criticisms are that the deadweight of investment in armaments and uneconomical substitutes has caused a restriction of popular consumption. There is too much expenditure on capital goods as against consumption goods; hence the marked recession of stock values after mid-July. Nazi economists claimed that they could go along indefinitely by means of credit-creation, so long as each new issue of credit increased total production; but foreign critics said that, to do this, a proper equilibrium must be maintained between capital goods and consumption goods. The authorities are trying to bridge the gulf by making the people accept a lower standard of living.

In the spring Dr. Schacht tried to limit the inflation of credit, but the ever-growing expenditure on defence frustrated his efforts; and, although tax-receipts increased by 15 per cent in 1938, the position grew steadily worse. At the annual meeting of the Reichsbank in March, Dr. Schacht held that more normal methods of finance could replace the emergency decrees of the last few years. On April 1 he replaced the ill-famed *Sonderwechsel* or "special bills" by new *Lieferschätze* or "delivery bills", which were to be issued in known amounts for short periods and were to be repaid at maturity from ordinary budgetary receipts. But owing to the deterioration of the financial position they have become just as much an instrument of credit-inflation as the "special bills". During the year some progress was made in consolidating short-term loans. Four long-dated loans were issued, for a total of £387,500,000, bringing the total amount of consolidated loans since 1935 to £1,166 millions. Despite the success of the loans, the debt position became much worse. At the end of the year the monthly deficit was estimated at £100 millions, and



German State Railways]
BRIDGE OVER THE WERRA ON THE KASSEL-GÖTTINGEN "AUTO-BAHN" OPENED IN 1938

the government was finding it difficult to borrow even half of this. Hence arose criticisms that the November pogrom had an economic motive, and hence too rumours in December about a capital levy The total public debt is said to be in the vicinity of £3,000 millions, but no official figures are given. Dr. Schacht told a meeting of economists in November that the Reichsbank had taken a great risk in granting thousands of milliards of marks in credits, but that this policy, which was not of Germany's choosing, has enabled the country to rearm herself and to attain a position where she can wrest economic advantages from other countries and thus set her own economic house in order After the September crisis, the Nazi problem was to prevent the credit-inflation degenerating into uncontrollable currency inflation The note-circulation has steadily increased By Sept 30 the notes in circulation exceeded eight milliard marks for the first time since the collapse of 1923 A year before the figure had been only 5¼ milliards, and it was absurd to say that an increase of sixty per cent was due to the expansion of industry.

The year closed, then, with the government facing grave economic problems. Despite the maximum of employment, debts and expenditure were rising enormously; the cost of living was going up, and a diminution in taxation returns was becoming inevitable owing to the growth of unproductive expenditure. With export prices falling and everything else rising, some form of devaluation or repudiation appeared a possibility.

In the meantime, plans for a trade drive in eastern and southern Europe were attracting more attention. Herr Funk made a tour of the Balkans, and a new commercial diplomacy was evolved, by which Germany took the primary commodities of the agricultural countries on advantageous terms and, by a barter-agreement, offered in return her own manufactured goods, often below cost The new markets, raw materials, and foodstuffs made the Four Year Plan practicable, and helped Funk's plans of an economic world-within-a-world. Germany's internal position was transformed and the balance of power in Europe altered. The political absorption of one zone of central Europe and the economic expansion over the remainder was thus a most significant development.

In foreign affairs, the basis of German policy remained the progressive realization of pan-Germanism, to be attained by co-operation with Italy (the Rome-Berlin Axis) and Japan (the Rome-Berlin-Tokyo Triangle). The Axis, strengthened by Hitler's visit to Rome in May and by Italy's aid to Germany during the September crisis, has become stronger. After the crisis, an Anglo-German declaration was made at Munich on Sept. 30, and was followed by a Franco-German pact of non-aggression signed at Paris on Dec. 6. The effects of these were minimized by Germany's support "in principle" of the Italian colonial claim and by the general deterioration of the international situation; and the possibility of a Four Power pact receded into the background. In December renewed German interest in eastern Europe became marked. By the "Judgment of Vienna" of Nov. 2, Germany and Italy demarcated the Czech-Hungarian frontier. Immediately afterwards, Germany opposed a joint Polish-Hungarian frontier in Ruthenia, and the coolness between Poland and Germany grew when it was felt that Germany was aiding the movement for a Greater Ukrainia, to include Polish, Rumanian, and Russian territories as well as Ruthenia. The year closed, then, with Hitler's dynamic foreign policy, strengthened by its recent successes, still "on the march". After the Sudetenland, Hitler stated that he had no more territorial grievances, but this was later qualified to except the legitimate agitation of Germans abroad to secure justice; and so the position remains where it was before. The colonial question was raised intermittently during the year, and Germany was annoyed by the stiffening of French and British opinion on the matter, but Hitler announced on Nov. 8 that "this is not a question to go to war about". The claims therefore remain in abeyance.

German State Railways]

MUNICH · THE HOUSE OF GERMAN ART, OPENED IN 1938

Inside Germany the process of "co-ordination" seemed to be complete. The *Gestapo* were unusually active, and barely a week passed without the red posters announcing the execution of some enemy of the State. To deal with the weakening of public morale after the war-scare of September, the official press worked up a regular spy-mania in November, and the "security service" claimed to have discovered a plot against the regime. The extraordinary feature was Hitler's own admission, in a speech of Dec. 2, of the continued existence of hostility to National Socialism. During the year, there was a marked divergence of policy between the extreme Nazis, led by Dr. Goebbels, Himmler, and Rosenberg, and the moderates under Field-Marshal Göring. The Führer himself fluctuated between the two camps, although his later speeches at Saarbrücken and Weimar were less restrained than his earlier ones.

The main fight for "co-ordination" was against the Churches and the Jews. The decree of Dec. 11, 1937, was enforced to secure direct State control over the Evangelical Church. Pastor Niemöller, the Confessional leader, was convicted on March 2, and has remained in a concentration-camp ever since. At the beginning of May, all pastors were ordered to take an oath of loyalty to the Führer and the regime or be dismissed. In November the administrative leaders of the Confessional Movement lost their posts, and it was reported that Hitler desired their trial for "treason at the altar". The campaign against the Catholics was no less bitter. Several penalizing decrees were issued in Bavaria early in the year, and the fight was continued in Austria after the *Anschluss*. On Oct. 8, the palace of Cardinal Innitzer was attacked in Vienna, and that of Cardinal Faulhaber in Munich on Nov. 12. Towards the end of December the Vatican prepared a White Book answering the decrees that were being mooted in Germany

to bring the Catholic Church under State control; and it appears that such decrees will not only abrogate the 1933 Concordat, but will strike at the very existence of Catholicism in Germany.

The position of the Jews (*see* ANTI-SEMITISM) has become intolerable. The avowed aim is their elimination from German economic life. Goring's decree of July 6 closed many occupations to them, and, after Aug 3, they were not allowed to practise as doctors. Jew-baiting set in afresh after the October crisis and especially on Nov. 10, on the occasion of the death of a junior diplomat, Dr. vom Rath, shot in Paris by a young Polish Jew. Widespread riots occurred for fifteen hours and were approved by the Nazi leaders. On Nov. 12, the Jewish community in Germany was fined 1,000 million marks (£84 millions), and Jews were forbidden to own retail shops. Further decrees in December precluded all Jews from owning houses or farmlands, and ordered the summary sale of existing holdings. The aim was to create an "economic ghetto", while in some towns actual ghettos were set up. If the Nuremberg Laws had reduced the 600,000 Jews of Germany to helotry, the November pogrom made it impossible for them to live as ordinary human beings. These events aroused widespread condemnation abroad, and dealt a heavy blow to the cause of appeasement. So strong was feeling in the United States that there was a clamour for the breaking off of diplomatic relations with Germany, and Mr. Hugh Wilson, U.S. ambassador in Berlin, was recalled to Washington "for report and consultation". The German government replied by recalling Dr. Dieckhoff, German ambassador in Washington. In December Mr. Ickes, U.S. Secretary of the Interior, made such a bitter attack on "German barbarism", that the German Chargé d'Affaires in Washington was instructed to make a formal protest. The protest was summarily rejected, and press polemics on both sides continued at a higher pitch than ever. On this unhappy note the history of Germany in 1938 closed. (S. H. R.)

THE ROCK OF GIBRALTAR

Spanish civil war refugees who had settled at Gibraltar was drastically cut down in May. The Spanish insurgent, General Queipo de Llano, was alleged to have prophesied, in a broadcast made at La Linea on Feb. 27, that Gibraltar would soon return to "its legitimate owners, the true Spaniards"; but it was stated shortly afterwards that the speech had been misreported In the British House of Commons in July the Secretary for War admitted the presence in Nationalist Spain of guns capable of shelling Gibraltar, but denied feeling any anxiety on this account. No. 1 Admiralty Graving Dock is being reconstructed, and when the new works are complete, will be capable of receiving the largest British battleships. At the end of March a new reservoir (1,175,000 gallons) was completed on the north-west side of the Rock, and the construction of another, of twice the capacity, is in progress.

GIRL GUIDES. The peak event of 1938 for Girl Guides happened in June, when 1,000 First-class Guides attended a service at St. George's Chapel, Windsor. Before the service the Guides marched past the King and Queen, and the Princesses Elizabeth and Margaret who were in Guide uniform.

Juliette Low was the founder of the American Girl Scouts, and, through a fund raised in memory of her, Guides from all countries where they exist can meet together every year. In 1938 the meeting took place at the Guide Chalet at Adelboden, and amidst its glorious surroundings a very happy and profitable time was spent. In July, Guides from many countries met at a camp in Lithuania. Such gatherings are a very real help towards widening the vision and minds of the girls who take part, and enabling them to understand the view-point of the girls of other nations.

A successful Sea Ranger Training took place on board the "Implacable", and a camp for Guides from public schools was held at Hatfield.

Camping has proved as popular as ever A new permanent camp site was opened at Cudham, in Kent, of which full use has been made by London Guides. Staffordshire has been given 123 acres by the Marquess of Anglesey as a permanent camp site for Scouts and Guides in commemoration of King George V. The site was opened by the Princess Royal on July 2

There is now a World Hostel in Palace Street, Westminster, towards which Guides from all over the world have subscribed, where they will be able to stay at any time they are visiting England

During the September crisis Girl Guides were able to co-operate in a very practical way with the Women's Voluntary Services, particularly in arranging reception details for the evacuation scheme, and in providing squads for the assembly of respirators and carrying out emergency duties.

The census for 1938 is not yet to hand, but according to the latest figures there are approximately 1,340,000 Guides in the world, 526,000 of them being in Great Britain. Twelve awards for gallantry have been made during the year. (N. M.)

GLANDS: *see* ENDOCRINOLOGY; PHYSIOLOGY.

GLASGOW. The second largest city in Great Britain and the fifth in the British Empire, covers an area of 39,788 acres, the 1931 census population of 1,088,524 was estimated to have increased to 1,126,000 by June 1938, the approximate rateable value is £11,082,859, and the rates for 1938–39—owners' 6*s.* 4·11*d.*; occupiers' 8*s.* 2·2*d.* The city is situated on both banks of the river Clyde, one of the world's greatest commercial highways; in the year ending June 30, 1938, the port was entered by 7,937,656 tons of shipping (13,390 vessels), and 7,784,264 tons (13,190 vessels) was cleared.

The city is a great shipbuilding centre, and during the first ten months of 1938, 73 vessels (among them the "Queen Elizabeth") of 352,340 tons were launched; manufactures include iron and steel goods, chemicals, textiles, tobacco, and haggis, while among the newer ones are aeroplane dope and accordions; the city had no strikes or industrial disputes during 1938. New municipal enterprises include the inauguration of a fleet of streamlined electric tram-cars; the Crookston Cottage Homes (opened on Sept. 6 by the Lord Provost), a settlement built by the Glasgow Public Assistance Department on a site of some 85 acres for aged persons, and including its own hospital; and the new Municipal Information Bureau, officially opened by the Lord Provost in April. Up to the end of October, 47,491 houses had been completed under the Corporation Housing Scheme, and arrangements made for the building of another 7,585.

Apart from the great Empire Exhibition (*see* FAIRS AND EXHIBITIONS), which was opened by Their Majesties in person and was visited by various members of the Royal Family, the chief social event of the year was the launching at Clydebank on Sept. 27 of the new Cunard White Star liner, "Queen Elizabeth", by H.M. Queen Elizabeth, accompanied by Princess Elizabeth and Princess Margaret, the attendance of the King having been prevented by the international crisis, then at its height.

GLASS. Production in Great Britain and America in 1938 showed an increase over 1935, the last year for which figures are available. The British glass industry, in 1935, used 530,000 tons of sand, employed 45,000 persons, and

made ware valued at £17 millions The American industry, 1935, used 2,300,000 tons of sand, employed 67,000 persons, and the value of ware made was $28.4 millions In both countries, bottles and jars make up about one-third the production value, with plate glass in second position. The comparatively lower number of employees and lower price per unit weight in American production are explained by more mechanization

The Glass Delegacy of Great Britain announced a fund approaching £40,000 for "Elmfield", the laboratories of glass technology, University of Sheffield. In the United States, a large corporation was formed for manufacturing glass wool and glass-fire products; a new process for silica glass reached the production stage, monopoly investigations revealed close control over feeding and forming machinery, the Interstate Commerce Commission ruled against the use of toughened (tempered) glass in motor cars, but its use had become general in England; all-glass buildings were designed to exhibit advanced ideas in architecture at the 1939 exhibitions.

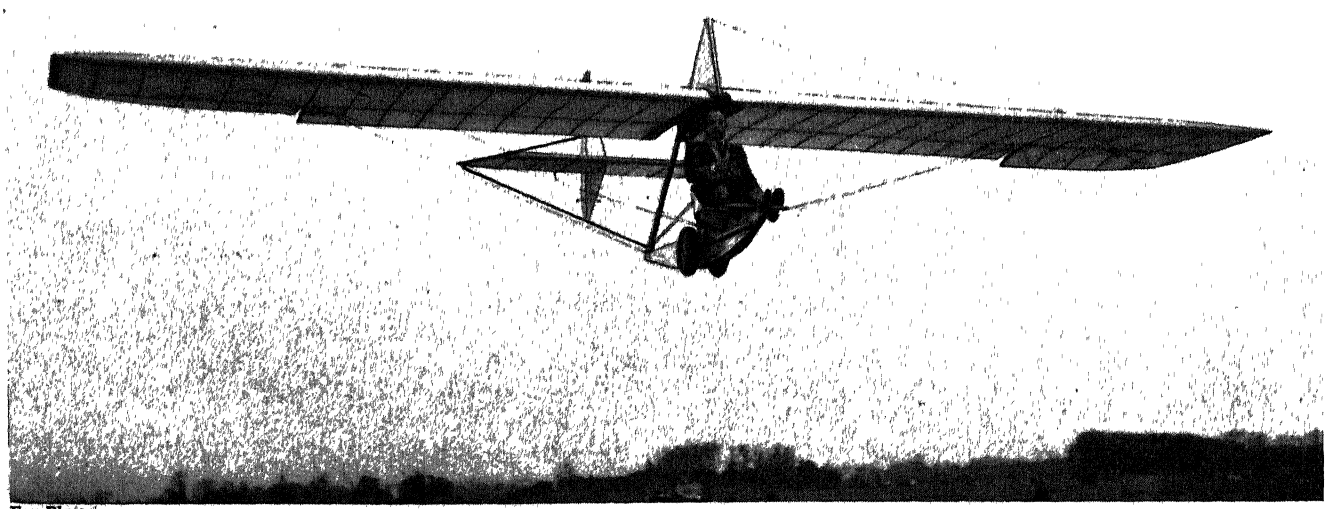
German glass technologists arranged the Third International Congress on Glass, to meet in Berlin and Munich, July 1939 (Milan, 1933; London, 1936). By acquisition of Austria and part of Czechoslovakia, Germany became the second nation in glass production, and first in numbers employed.

Research continued on fundamental properties of glasses as clues to their constitution. International co-operation was applied to methods for studying strength, chemical durability, and thermal properties of glass. (*See* also INDUSTRIAL RESEARCH.)

BIBLIOGRAPHY. G. W. Morey published in 1938 *The Properties of Glass*, a fine compendium of present-day knowledge on this material.

GLIDING. The science of flying without power has made far greater progress in 1938 than in any preceding year. As more than 1,000 pilots now hold the highest "Silver C" international rating, the I.S.T.U.S. (*Internationale Studienkommission für den Motorlosen Flug*) has issued a higher "Golden C" with requirements of 1, "Silver C"; 2, Distance of 300 km.; 3, Altitude of 3,000 metres. More than 15 pilots already have won this award.

The German pilot, Dreschsel, reached the astounding altitude of 23,190 feet, beating the record of 20,303 established only four days previously by another German, Werner Flick. Dreschsel was towed by an aeroplane up to a height of 3,080 feet, and then released Another German Bernard Flinsck, set an international distance and return record of 190 miles. The Russian pilot, Kartashev, established a new distance record of 400 miles with a passenger Two Austrians, Kahlbacher and Führinger, made a duration record of 40 hrs, 51 min A new record for two-seater gliders was made by two British pilots, Flight-Lieut W B Murray and J. S. Sproule, who took off from Dunstable Downs and remained in the air for 22 hrs. 13 min 35 sec



A British long-distance record set up by Fox (144 miles) on April 18 was broken by P. Wills, who on April 30 flew from Heston to St Austell (Cornwall), about 200 miles. A British record for duration was made by H. O Pich, with 13 hrs 27 min In Germany a distance record set up on April 19 by Khetz (143 miles) was broken by L Hoffman with a flight of 218 miles from Trebbin (near and S. of Berlin) to Deblin (N. of Brno, Czechoslovakia).

Two American national records were made in 1938. On April 19, L. B. Barringer made the distance record on a "goal" flight of 212 miles from Wichita Falls, Tex., to Tulsa, Okla., the first long-distance flight ever made over level country. Richard du Pont exceeded his altitude record by reaching 6,804 feet.

GOEBBELS, JOSEF (1897–), German Reich minister for propaganda and president of the Reich culture chamber, during 1938 strengthened his control over the press, radio, and cultural activities generally. On Jan. 1, in a broadcast message to the nation, he proclaimed that "Versailles is dead, and the Geneva institution that arose from it will suffer a similar fate", and in another on the 30th, the fifth anniversary of Hitler's appointment as Chancellor, he said that their aspirations during those five years seemed now a distant dream, for they had become realities.

Early in February he was appointed to the secret cabinet council newly created by the Führer to advise him on foreign policy, and in March organized the oratorical campaigns that heralded plebiscites for the *Anschluss*, himself reading its proclamation from a balcony of the Vienna Rathaus on April 10. During the autumn he played a leading part in the events that led to the transference of Czechoslovak territory to Germany.

In 1938 Herr Goebbels' speeches were characterized by bitter attacks on the foreign Press and the Jews, by demands for the return of colonies, by denunciations—at Nuremberg—of democracy and "its offspring, Bolshevism",

HERR R. KRONFELD DEMONSTRATING AT OXFORD UNIVERSITY GLIDING CLUB, FOUNDED IN 1938

and by exhortations to German solidarity and trust in armed force. It was he who, on Nov 12, announced the punitive measures to be taken against the Jews (*see* GERMANY; ANTI-SEMITISM) after having, on the 10th, issued orders that the unauthorized onslaught on them was to cease.

GOGA, OCTAVIAN, Rumanian statesman, was born in Transylvania in 1881, and died on May 7, 1938. After having held office as minister of cults and minister of the interior under Averescu, he formed the National Agrarian Party. This was later amalgamated with the Anti-Semitic National Christian League of Defence to form the National Christian Party In Dec. 1937 M. Goga formed a government, but remained prime minister only until Feb. 11, 1938. M. Goga had considerable reputation as a poet, and he translated much Hungarian poetry into Rumanian. His play *Mr. Notary* was also a success.

GOLD. Unlike other commodities, gold continued to appreciate in terms of sterling in 1938, the quotation rising progressively from 139*s.* 5*d* in January to 150*s* in November Largely for this reason output reached a new high record. The world production for the year was approximately 36,750,000 fine ounces, compared with 34,783,000 in 1937 and 33,109,000 in 1936.

The Witwatersrand, the declared value of whose output rose by £4 millions to £86 millions, again produced approximately one-third of the world output. The proportion would have been still larger had not the policy been continued of reducing the grade of ore milled with the object of prolonging the life of the mines. Thus the average yield per ton treated (the total tonnage milled amounted to 53,834,000) fell from 4·46 dwt to 4·35 dwt and as there was at the same time an increase in the cost of production (which averaged 19*s.* 3*d.* per ton of ore milled, as against 18*s.* 11*d*) the working profit was barely maintained at approximately £31,700,000 (11*s.* 9*d* per ton of ore milled). The total dividends distributed showed little change at £17 millions, the balance of the year's profit being absorbed mainly by taxation, though large appropriations were also set aside to finance capital expenditure.

Fox Photos]
THE GOLDEN MILE, KALGOORLIE, AUSTRALIA

Despite the expansion in output, the payable ore reserves of the Witwatersrand were well maintained, around 220 million tons, largely because the advance in the price of gold rendered profitable ore which had previously been classed as unpayable and facilitated development at greater depths than had previously been worked. A contributory factor was the bringing of several new mines into production. Outside the Witwatersrand, proper, exploration and development proceeded rapidly in the newly-discovered gold-bearing districts in the Far West Rand and Far East Rand, and though these districts have yet to reach the production stage, which always necessitates very heavy preliminary expenditure, there is little doubt that they will in due course provide an adequate offset to the gradual exhaustion of the existing producing mines in the central field. In the Orange Free State, exploration held out high hopes early in the year that another new gold-field had been discovered but the results have so far proved disappointing, though two of the leading mining groups have closely associated themselves with the principal enterprise in this region.

The Rand mining industry is vitally dependent on cheap supplies of native labour and, in view of the extension now in progress, which is expected to require an addition of over ten per cent to the labour force in 1939, active steps have been taken to enlarge the area of recruitment by the enrolment of tropical natives, whose suitability for employment underground at the great depths at which many of the mines are being worked has now been successfully established.

Elsewhere, the production of gold, though not the opening up of new areas, has in several countries shown greater proportionate progress than in South Africa, where the primary aim has been stability of output consistent with the maintenance of profits. The most spectacular progress was made by Canada, whose output of gold rose by over fourteen per cent, placing that country third in the list of world producers. There was also a large expansion in the output of Australia, the Gold Coast, Colombia, and the Philippines. Estimates of production in the Soviet Union, for which no official figures are available, have had to be scaled down considerably in recent years but it would appear that that country still holds second place among the world producers of gold. (P. F.)

GOLD COAST, THE. The Gold Coast consists of the Colony, Ashanti, and the Northern Territories. Togoland (*q.v.*), under British mandate is administered as part of the territory. The Colony contains an advanced African community: Africans sit on the legislative and municipal councils, and are employed in the higher branches of the civil service. Efforts are being made to reorganize native administration and to develop a more satisfactory system of indirect rule through the chiefs than exists at present. In the Colony the decay of tribal rule owing to the frequent "destoolments" of chiefs, and reluctance to accept any regular system of local taxation, provide serious obstacles.

In the Ashanti, where the Confederacy, in abeyance since the wars of 1896, was restored in 1932, reorganization is more successful; but, here again, progress cannot be satisfactory until the people accept taxation and treasuries are formed for the financing of social services. In the more primitive Northern Territories the position is more favourable, and during 1938 local taxation has been introduced.

While gold and minerals are of increasing importance, the cocoa crop, produced by the individual efforts of innumerable African farmers, remains the backbone of Gold Coast prosperity and forms about forty per cent of the world production. Towards the end of 1937 cocoa growers withheld supplies from the markets as a protest against a price agreement entered into by the purchasing firms. A Colonial Office Commission visited the Colony during 1938 to report on this dispute, and has recommended the formation of a statutory association of all cocoa producers for the marketing of their produce. A Commission has also investigated economic and social conditions (the Leverhulme Research Commission), and another is to report on Achimota College. (J. L. K.)

Area and Population:
Area 91,843 sq. m. (Colony 23,937 sq. m.; Togoland 13,041 sq. m.).
Population (est. June 1937): Native 3,700,267 (Non-African (1931) 3,182.

Governor. Sir Arnold W. Hodson, K.C.M.G.

Production 1937: (E indicates export figures):

Cocoa (E)	235,713 tons
Palm Kernels (E)	2,512 ,,
Manganese (E)	527,375 ,,
Gold	529,212 oz.
Diamonds (E)	1,577,600 carats (£648,057)
Lime Juice (E)	187,215 galls.
Rubber	886,816 lb.

Overseas Trade 1937:
Imports £19,228,363 (specie and currency notes £6,921,608).
Exports, domestic £15,949,533
Re-exports £268,660

Communications 1937:
Roads, maintained by Public Works Dept.. 2,121 miles
Railways, open to traffic 500 ,,
Shipping, net tons (1937): entered, 2,609,644; cleared, 2,614,021.

Finance:

Revenue (1937–38)	£3,791,673

Education Dec. 31, 1937:
Elementary Schools: Government, 21; assisted, 417; others, 280.
Scholars, total 70,873. Secondary schools, 20; scholars, 2,758.

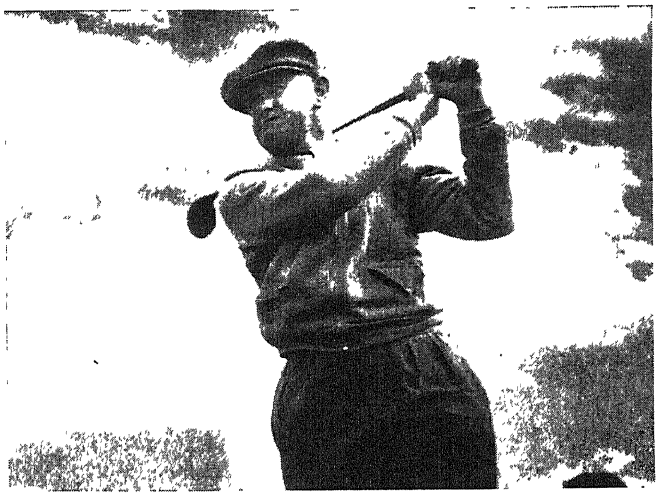
GOLDSMID-MONTEFIORE, CLAUDE JOSEPH, British scholar and philanthropist, was born in London in 1858, and died in London on July 9, 1938. He was educated at Balliol College, Oxford, and thereafter became prominent lay chief in liberal Judaism. He was president of the Anglo-Jewish Association from 1896 to 1921, and president of the University College, Southampton, from 1915 to 1934. His opposition to Zionism was not abated by his growing concern at the persecution of the Jews in parts of Europe. Among Dr. Goldsmid-Montefiore's publications were: *The Origin and Development of the Religion of the Ancient Hebrews*, Hibbert Lectures, 1892; *Some Elements of the Religious Teaching of Jesus*, Jouett Lectures, 1910; *Liberal Judaism and Hellenism*; *The Old Testament and After*; and *The Bible for Home Reading*.

GOLF. The outstanding golfing event of 1938 was Great Britain's defeat of the United States in the Walker Cup match at St Andrews, for the first time since the series began in 1921. Tribute was paid on all sides to John Beck, himself a former Walker Cup player, who acted as non-playing captain. Great Britain won by seven matches to four, with one halved, and on the two days' play thoroughly deserved the victory.

In the previous week Charles Yates, a member of the visiting American team, won the British Amateur Championship at Troon, beating R. C. Ewing, of Sligo, in the final. He proved to be one of the most popular Americans who ever came to Britain.

The "discovery" of the year was James Bruen, an eighteen-year-old Irishman, who in the Walker Cup trials completed eight rounds at St Andrews in an average of something like seventy. Later he won the open and close championships of Ireland and established himself as the most promising British amateur in modern times. Other national champions were J. J. F. Pennink (England), E. D. Hamilton (Scotland), and A. A. Duncan (Wales).

England at last won the four-cornered international series at Royal Porthcawl, Scotland having won ever since this event began in 1932. They were captained by Cyril Tolley, who won the President's Putter at Rye for the first time. British amateurs were also successful on the Continent, Harry Bentley retaining the German amateur championship and Brig.-Gen. A. C. Critchley winning the Belgian and Dutch. The inter-university match was won by Cambridge at Westward Ho by ten matches to four.



The women's international match against the United States for the Curtis Cup was a disappointment to Britain, who had a good chance of winning for the first time. Despite a lead on the foursomes they lost the match at the Essex County Club, Mass., by five games to three, with one halved. Later they made a poor showing in the U.S. national championship, but a new-comer to the team, Miss Clarrie Tiernan, was narrowly beaten in the Canadian final.

Mrs. Andrew Holm became British champion for the second time after dominating the field at Burnham and Berrow. Miss Elsie Corlett, the runner-up, later had the consolation of winning the English title at Aldeburgh, an event which escaped the usual notice through unhappily coinciding with the European crisis. Miss Jessie Anderson

Sport & General

WALKER CUP FINAL AT ST. ANDREWS: C. YATES (U.S.A.) AND J. BRUEN (GT. BRIT.) ON THE 34TH GREEN

Sport and General]
R. A. WHITCOMBE DRIVING IN THE OPEN GOLF CHAMPIONSHIP AT ST. GEORGE'S, SANDWICH, JULY 8, 1938

won the Scottish title and Mrs. Beck, wife of the Walker Cup captain, the Irish.

Reginald Whitcombe, at Deal, became the first member of this distinguished golfing family to win the open championship. A hurricane blew on the final day, demolishing a large exhibition tent and rendering the golf so difficult that in the last round only three players returned scores of less than eighty. Whitcombe later won the Brighton tournament in a gale of almost equal force.

Alfred Perry had a successful season, winning three tournaments. In the Dunlop-Metropolitan he holed the West course at Wentworth in 69, 68, 67, 69—the first British player to " break seventy " in every round of a major tournament. The young Welshman, Dai Rees, won the professional match play championship for the second time, while Henry Cotton secured the Harry Vardon Memorial Trophy with a season's average of 72·87. On a Continental tour he won the open titles of Belgium, Germany, and Czechoslovakia.

In partnership with Reginald Whitcombe, Cotton defeated the South Africans A. D. Locke and S. Brews in a £500 challenge match at Walton Heath by two and one. The game was characterized by the slowness of the play and the four rounds took nearly sixteen hours. (H. Lo.)

United States. Economic recession apparently had little influence in 1938 upon the resurgence of golf interest so noted in 1937. There were instances of further revision of financial structures in private organizations, but the season found 5,196 golf-courses operating. Of these, 3,489 were private. The others were either municipal or daily fee courses.

The total number of golfers listed (approximate) was 1,376,000 private club members and 463,000 municipal or daily fee players.

The much-discussed ruling which limited a contestant to fourteen clubs had little effect upon scoring in major championships. The United States Golf Association amended the stymie rule, so that a ball within six inches of the cup would be treated as a ball within six inches of another ball, thus giving a contestant the option of requesting that the ball nearer the hole be lifted, whether or not it obstructed his line to the cup.

Perhaps the most-discussed club of the year was the heavy-soled niblick, known as the sand-wedge. Many players, limited to fourteen clubs, discarded implements used infrequently, and substituted sand-wedges of varying degrees of weight and loft In the United States Amateur championship, Willie Turnesa, the winner, carried only two wooden clubs.

Sam Snead, powerful young athlete from West Virginia, became the golfer of the year in America, although he failed to win a major title. Snead, whose prodigious driving and phenomenal scoring earned him approximately $20,000 in prize money, an all-time record in the United States, overshadowed Ralph Guldahl, who defended successfully the United States Open title, and won the Western Open championship for the third consecutive year.

Snead fared poorly in the United States Open, played at Denver, Colo. In this event Guldahl was four strokes behind Dick Metz of Chicago at the beginning of the fourth, and final, eighteen-holes. The defending champion scored a 69, to win the championship by six strokes. Metz finished second. The week following his Denver victory, Guldahl won the Western Open, finishing seven strokes ahead of Snead. Snead reached the finals of the National Professional Golfers Association championship at Shawnee-on-Delaware, Pa , and was a favourite to defeat Paul Runyan, a former champion. Runyan's putting was sensational, and he defeated Snead eight and seven in the 36-hole final. Willie Turnesa won the United States Amateur title when he defeated B. Patrick Abbott, former United States public links champion, by eight and seven in the finals at Oakmont Country Club, Pittsburgh.

Patty Berg, twenty-year-old University of Minnesota student, turned the tables on Mrs. Estelle Lawson Page of Chapel Hill, N.C., when she defeated her by six and five in the finals of the United States women's championship at Westmoreland Country Club, Wilmette, Ill.

GONORRHŒA: *see* VENEREAL DISEASES.

GÖRING, FIELD-MARSHAL HERMANN WILHELM (1893–), minister-president of Prussia, air minister, and commissioner of the Four Year Plan of the German Reich (see *Ency Brit. Book of the Year*, 1938, p. 290), was on Feb. 4, 1938, raised to the rank of field-marshal, and became a member of the new secret cabinet council. In mid-March, when Herr Hitler was in Austria, he acted as Chancellor. At the end of the month he made a speech in Vienna foreshadowing the trial of Herr Schuschnigg and the expulsion from the city of her 300,000 Jews, and at the end of April issued decrees confiscating Jewish capital. In mid-May he was again in Austria, supervising the application of the Four Year Plan, in connexion with which he inaugurated at Linz the Austrian Works of the Reichswerke Hermann Göring (a newly-formed company for the development of low-grade iron-ore fields).

On June 23 the Field-Marshal issued decrees announcing the conscription of the labour of all German nationals, men and women, capable of work, and five days later took power to fix maximum as well as minimum wage standards. Earlier in this month he had opened at Kronenberg the Hermann Göring Master School of Painting which, under his direct patronage, is to produce a truly national art on a new ethical basis. At the Nuremberg rally in his sabre-rattling speech (Sept. 10), he referred to " those ridiculous dwarfs of Prague ", British rule in Palestine, and the overwhelming might of Germany.

Frau Göring, the former actress, Emma Sonnemann, presented her husband with his first child, a daughter, on June 2 ; she was given the name Edda, that of Sig. Mussolini's daughter, the wife of Count Ciano. Among the Field-Marshal's many hunting visitors during the year were Mr. Geoffrey Lloyd, of the British Home Office (with whom

A.R.P. was discussed), the British Ambassador, M. Stoyadinovitch, Marshal Balbo, and Admiral Horthy

GORT, JOHN STANDISH SURTEES PRENDERGAST VEREKER, V.C., 6th Viscount (1886–), Chief of the British Imperial General Staff, succeeded his father in the viscountcy and in the barony of Kilbarton (both in the Irish peerage) in 1902. He was educated at Harrow and Sandhurst, and joined the Grenadier Guards as second lieutenant in 1905. In 1913 he was appointed A.D.C. to the G.O.C. the London District, became captain in the following year, and, on the outbreak of the World War, was in the first contingent that went to France. He served throughout the war, sometimes on the staff and at others at regimental duty; he was four times wounded, was mentioned in dispatches nine times, and earned, beside the V.C., the M.C. and the D.S.O. with two bars. He was an instructor at the Staff College from Jan. 1921 till April 1923, when he rejoined his regiment as O.C. In 1926 he became chief instructor at the Senior Officers' School and in the following January was appointed Gen. Staff Officer (first grade) Shanghai Defence Force. From Aug. 1927 till 1930 he held a similar appointment in the 4th Division, becoming in the latter year colonel commanding the Grenadier Guards and Regimental District. From Nov. 1932 till early in 1936 Viscount Gort was in India as Director of Military Training, and, having been in the meantime (Nov. 1935) promoted major-general, became commandant of the Staff College, Camberley, in March 1936. On Sept. 24, 1937, he was appointed military secretary to the Secretary of State for War with the local rank of lieutenant-general, and received his present appointment a few weeks later (Dec. 2).

Lord Gort was awarded the M.V.O. in 1910 and the C.B.E. in 1928. In 1911 he married his cousin Corinna Katherine Vereker (from whom he obtained a divorce in 1925), and has one son and one daughter.

GOVERNMENT DEPARTMENTS, BRITISH. The following were at the close of 1938 the ministers, permanent under-secretaries, etc., of the more important of the government departments of Great Britain:

Admiralty, The Board of: *First Lord,* Rt. Hon. Earl Stanhope; *Permanent Secretary,* Sir R. H. Archibald Carter.

Agriculture and Fisheries: *Minister,* Rt. Hon. W. S. Morrison (succeeded in Jan. 1939 by Sir Reginald Dorman-Smith); *Permanent Secretary,* Sir Donald Fergusson.

Air Ministry: *Secretary of State,* Rt. Hon. Sir Kingsley Wood; *Permanent Under-Secretary,* Col. Sir Donald Banks.

Burma Office: *See* India Office.

Cabinet Office: *Secretary,* E. E. Bridges.

Civil Service Commission: *1st Commissioner,* Sir Roderick Meiklejohn.

Colonial Office: *Secretary of State,* Rt. Hon. Malcolm MacDonald; *Permanent Under-Secretary,* Sir Cosmo Parkinson.

Commissioners of Crown Lands: *Commissioner,* the Minister of Agriculture and Fisheries (*ex officio*); *Permanent Commissioner,* C. L. Stocks.

Committee of Imperial Defence: *Chairman,* the Prime Minister; *Deputy Chairman and Minister for Co-ordination of Defence,* Rt. Hon. Sir Thomas Inskip (succeeded in Jan. 1939 by Admiral of the Fleet Lord Chatfield); *Secretary,* E. E. Bridges.

Crown Agents for the Colonies: Sir W. Cecil Bottomley, H. C. Thornton, and J. E. W. Flood.

Customs and Excise, Board of: *Chairman,* Sir G. Evelyn P. Murray.

Dominions Office: *Secretary of State,* Rt Hon Malcolm MacDonald (succeeded in Jan 1939 by Sir Thomas Inskip); *Permanent Under-Secretary,* Sir Edward Harding

Duchy of Lancaster: *Chancellor,* Rt Hon. Earl Winterton (succeeded in Jan. 1939 by Mr. W. S Morrison), *Vice-Chancellor,* Sir John Bennett

Education, Board of: *President,* Rt. Hon. Earl De la Warr, *Permanent Secretary,* Sir Maurice Holmes

Foreign Office: *Secretary of State,* Rt. Hon Viscount Halifax; *Permanent Under-Secretary,* the Hon Sir Alexander Cadogan.

Health, Ministry of: *Minister,* Rt. Hon Sir Walter E Elliot; *Secretary,* Sir George Chrystal

Home Office: *Secretary of State,* Rt. Hon. Sir Samuel Hoare, Bt; *Permanent Under-Secretary,* Sir A. Maxwell.

India Office: *Secretary of State,* the Most Hon. the Marquess of Zetland; *Permanent Under-Secretary,* Sir Findlater Stewart.

Inland Revenue, Board of: *Chairman,* Sir Gerald B. Canny.

Labour, Ministry of: *Minister,* Rt. Hon. Ernest Brown; *Secretary,* Sir T. W. Phillips.

Patent Office: *Comptroller-General,* M. F. Lindley.

Paymaster General's Office: *Paymaster General,* The Earl of Munster (succeeded in Jan. 1939 by Earl Winterton)

Pensions, Ministry of: *Minister,* Herwald Ramsbotham, *Permanent Secretary,* Sir Adair Hore.

Post Office: *Postmaster-General,* Maj. the Rt. Hon. G. C. Tryon; *Director General,* Sir Thomas Gardiner.

Works and Public Buildings: *First Commissioner,* Rt. Hon. Sir Philip Sassoon, Bt.; *Secretary,* Sir Patrick Duff.

GOVERNMENT EXPENDITURE. Different countries have different financial traditions and methods, and budget problems vary from one country to another. Yet over a large part of the world, the year 1938 inflicted upon governments and treasuries one single problem. This was how to provide for a rapidly mounting rearmament bill at a time when both tax revenue and national savings were feeling the effects of the trade recession which began in the previous year.

United Kingdom. The British government's estimated expenditure for 1938–39 is summarized in the following table, which also brings it into perspective with the budgets of previous years. The source is the *Economist* Budget Supplement, April 9, 1938:

Period*	Natnl Income ‖ £ mn	Total Expenditure † £ mn	%	National Debt ¶ £ mn	%	Defence £ mn	%	All Other £ mn	%
1870–76§	1,177	70	5·9	27	2 3	26	2·2	17	1 4
1877–85§	1,242	79	6·4	29	2·3	30	2·4	20	1 7
1886–93§	1,410	80	5 7	26	1·8	32	2·3	22	1·6
1894–1903§	1,666	130	7·8	24	1·4	69	4·1	37	2 3
1904–1910§	1,940	138	7 1	27	1·4	62	3·2	49	2·5
1911–13§	2,241	165	7·4	24	1·1	73	3·3	68	3 0
1924 .	4,035	745	18 5	357	8·8	115	2·9	273	6 8
1929 .	4,384	771	17·6	355	8·1	113	2·6	303	6 9

* Figures of National Income refer to calendar years, figures of expenditure to financial years ended March 21 of following calendar year.

† Including Road Fund expenditure, but not Post Office.

‡ Estimate. § Annual average

‖ Figures are taken from *National Income and Outlay*, by Colin Clark (Macmillan, 1937), pp. 88, 90, and 232 ; they represent net National Income, as defined by Mr. Clark. The figures for 1936, 1937, and 1938 are very tentative guesses for which Mr. Clark is not responsible ; the 1938 figure in particular is necessarily no more than a guess.

¶ Including Sinking Fund

Even these 1938–39 totals are incomplete, for they do not include supplementary estimates for the defence services presented at dates subsequent to the budget of April, 1938. By the end of 1938 these had raised the total estimated defence expenditure from £343 to £358 millions. Whether all this money is actually spent during the financial year 1938–39 will only be known on March 31, 1939.

So far the rearmament burden is not intolerable. It amounts to only 6·9 per cent of the national income, and still falls short of the £461 millions to be spent on administration, the social services, and the miscellaneous costs of government. Still, the total bill, as shown in the table, was £126 millions in excess of the previous year.

To meet the extra expenditure, the Chancellor had had a surplus of £29 millions in 1937–38, and also reckoned to receive an extra £42 millions from his 1938–39 revenue estimates on the basis of the taxation current in 1937–38. Thirty million pounds was to come from increased taxation, including the raising of the standard rate of income tax from 5*s.* to 5*s.* 6*d.* in the pound, and also increases in the duties on petrol and tea. Finally, he envisaged the borrowing of £90 millions in 1938–39, against actual borrowing of only £65 millions in 1937–38. In these ways the gap of £126 millions was bridged.

France. Here the budget problem is intimately connected with the attenuated national income, and until recently the disposition of French savings to seek refuge overseas. Early in April, M. Blum estimated immediately before his fall that the total deficit then was Frs. 49,700 million. His proposals for rectifying this deficit brought about his fall, and M. Daladier took office with M. Marchandeau as his finance minister. By imposing new taxation, by extending his borrowing from the Banque de France, and by floating new loans, M. Daladier managed to reduce the 1938 deficit to Frs. 12,700 millions. Also his devaluation of the franc induced the repatriation of a substantial amount of fresh capital. In these ways he managed to get through until the September crisis, which thrust upon the Treasury the emergency defence expenditure of that month. This created new difficulties and gave rise to fresh political manœuvring. The upshot was that M Reynaud replaced M. Marchandeau as finance minister, and quickly presented France with a comprehensive financial programme.

France's expenditure for 1939 was summarized by him as follows :

	Frs. millions
Ordinary budget . . .	64,500
Extraordinary budget . .	29,500
Caisse d'amortissement expenditure	7,500
Local authorities .	24,000
Railway deficit .	6,000
Public works .	5,500
Total .	Frs. 137,000

Actually Frs 137,000 millions only equals £770 millions, so that the French burden is less than the British burden. Relatively, the French burden equals no less than 55 per cent. of the French national income, estimated by M. Reynaud at Frs. 250,000 millions, equal to £1,400 millions. That is why M. Reynaud insisted that the real solution to the problem lay in an expansion of French national income, production, and savings.

Meanwhile, he had in sight revenue of Frs. 85,500 millions, leaving a deficit of Frs. 51,500 millions. Over half this deficit was represented by the extraordinary budget of Frs. 29,500 millions (or £165 millions), consisting mainly of rearmament expenditure

For 1939, M. Reynaud proposes Frs. 3,000 millions of economies on public works ; Frs. 8,750 millions of increased taxation ; and Frs. 6,000 millions of new borrowing from the Bank of France. Through the general economic recovery of the country, he hopes to get Frs. 5,500 millions, representing the greater buoyancy of the revenue. For the rest, he trusts to an expansion on national savings and a repatriation of capital now abroad, which in time will permit him to float new loans.

Germany. No details of Reich expenditure have been published since March 31, 1935. The 1934–35 budget showed expenditure of RM. 8,000 millions, and according to private estimates, annual expenditure had risen by 1938–39 to RM. 18,000 millions, including RM. 10,500 millions for rearmament and public works. Dr. Schacht, in an address delivered by him on Nov. 29, 1938, said that the total German indebtedness created by expenditure of this kind was considerably less than was estimated outside Germany, and this looks as if the above figures are an over-estimate. The actual truth, however, has still to be disclosed. Dr. Schacht's argument was that it was legitimate to finance rearmament and public works by drawing bills which were rediscounted by the banking system, so long as Germany had a reserve of unemployed labour. By the beginning of 1938 that reserve had been absorbed, and so on April 1, 1938, the creation of credit by the issuing bank (*i.e* the Reichsbank) was stopped, and Reich expenditure was henceforward financed solely by taxation and loans. The transition was effected by means of Treasury bills.

Italy. So far as can be deduced from various statements by the finance ministers during 1938, the following table shows Italian revenue and expenditure :

	1937–38 (lire millions)	1938–39 (lire millions)
Total expenditure . .	25,035	29,316
Of which, Defence . .	9,000	7,033(?)
Total receipts . . .	25,072	24,561
Surplus (+) or deficit (−) .	+ 37	− 4,755

The original 1938–39 defence estimates were Lit. 5,799 millions, but in December an addition of Lit. 1,234 millions

was made to the service credits for the current year This gives the total of Lit 7,033 millions, but it does not follow that this will be the sum actually spent

The 1939-40 estimates, approved by the Council of Ministers on Dec. 14, 1938, foreshadow the following defence expenditure :

Army	3,606	million lire
Marine	2,703	,, ,,
Air	2,165	,, ,,
Total	8,474	,, ,,

The increase of Lit 2,675 millions over the 1938 30 original estimates is described as the first instalment of the additional Lit. 10,000 millions to be spent on defence in view of the "unavoidable requirements of the situation".

Japan. The following table shows Japanese expenditure during recent years :

	1931-32	1936-37	1937*-38	1938*-39
Government expenditure (million yen)	1,477	2,272	5,463	8,400
Of which borrowings (million yen)	120	680	3,393	5,800
War expenditure per cent of total	31	46	73	81
Outstanding government bonds, end December (million yen)	4,525	9,072	10,585	12,422†

* Budget estimate. † End June.

The total of budget and supplementary estimates since the outbreak of the war with China is, according to the *Economist*, Oct. 29, 1938, Yen 7,600 millions, and the outstanding total of government bonds is now about equal to the national income. The cost of the war is being met largely out of borrowing, which will amount to over Yen 9,000 millions for the two years to March 31, 1939. This borrowing has, among other consequences, caused an inflationary expansion of about twenty per cent in the note circulation and bank deposits. (N. E. C.)

United States. For the fiscal year ending June 30, 1939, Federal expenditures in the United States are scheduled to reach a new peace-time high level at $9,492 millions. This represents an increase of $1,866 millions, or 25 per cent, over the 1937–38 budget. Coupled with a decline in estimated receipts for the year, the increased outlay results in a rise in the net deficit from $1,384 millions in 1938 to $3,972 millions in 1929. Except for the year 1936, when the soldiers' bonus was paid, and the year 1934, the estimated deficit for 1939 is larger than that in any previous year outside the World War period.

In the budget submitted to Congress requesting appropriations for the fiscal year ending June 30, 1940, a decline in total expenditures of approximately $500 millions is proposed. Slightly higher receipts are anticipated and the deficit calculated for 1940 is $3,326 millions.

The marked increase in expenditures in 1939 is largely accounted for by an expansion in various relief outlays. Expenditures for unemployment relief and the Agricultural Adjustment programme are estimated to be $1,086 millions higher than in 1938. An additional increase of $349 millions is proposed for public works. Expenditures under the Works Progress Administration increased from slightly over $100 millions per month in the last quarter of 1937 to slightly over $200 millions per month in the final quarter of 1938. The recovery which began in the middle of 1938 reduced the volume of unemployment somewhat by the end of the year, but relief requirements remained at relatively high levels Expenditures under the programme of the Public Works and United States Housing Authority administrations are scheduled to increase through the first half of 1939.

For the fiscal year ending June 30, 1940, ordinary expenditures for national defence are scheduled to increase by $111 millions, and an additional appropriation of $210 millions has been requested for a new national defence programme. Proposed expenditures for unemployment relief are $722 millions lower than for the 1938 fiscal year. The adequacy of the request for relief expenditures will depend entirely on the degree of recovery experienced through the first half of 1940

GRAIN CROPS. Under this heading are reviewed the principal grain crops of the world, with the exception of wheat, which is the subject of a separate article (*q.v.*).

Maize. The output of maize in 1938 was, with one or two exceptions, smaller in every producing country of importance than it was in the preceding year. The reduction in the crop of the United States was partly caused by a smaller acreage, which was brought about by the government's cropping plans. In other words, United States farmers, who wished to qualify for government loans on their crops, were obliged to curtail the acreage. Argentina's crop was cut down considerably by drought, and the output of twenty million quarters was the smallest since 1920. The Danubian group of countries produced four million quarters less than in 1937, and there was a decrease of fully three million in South Africa.

Fox Photos]
GATHERING THE MAIZE HARVEST IN SUFFOLK, SEPT. 1938

The following statement shows the crops of 1938, for which official estimates were available :

***Maize Crops* (*in quarters of 480 lb.*)**
(000 omitted)

	1938	1937	Average 1932–36
Europe (without Russia)	81,000	88,000	79,000
United States	287,000	308,600	245,000
Argentina	20,300	41,900	39,000
South and East Africa	8,000	11,300	7,300
Other ex-European countries	54,000	51,600	50,500
Total	450,300	501,400	420,800

Sources of Supply. Argentina, Danubian countries, South Africa, and French Indo-China are, in the order named, the countries that importers usually depend upon for their annual requirements, but owing to the partial crop failure in Argentina, large supplies had to be obtained from the United States. This country's shipping season begins in November, and it is necessary to state that the 1938 exports were made from the crop harvested in the previous year The accident of Argentina's partial crop failure really paved the way for the re-entry of the United States into the international market. The United States shipments in 1938, of roundly sixteen million quarters, were the largest of any year since 1922, when nineteen million quarters were shipped from a crop of 359 million quarters.

Principal Countries' Shipments (in quarters of 480 lb.)

(000 omitted)

	1938	1937	Average 1932–36
United States	15,930	690	391
Argentina	10,683	42,260	30,300
Balkans and Russia	3,486	†6,735	7,300
South and East Africa	1,136	5,225	1,900
Indo-China	2,572	†2,630	1,700
Total	*33,807	57,540	41,591

* January/November. † revised.

Trade Features. It is not often that maize sells at a higher price than wheat, but such conditions were at least characteristic of the latter half of the year under consideration. This is explained by the lack of serious competition by Argentina.

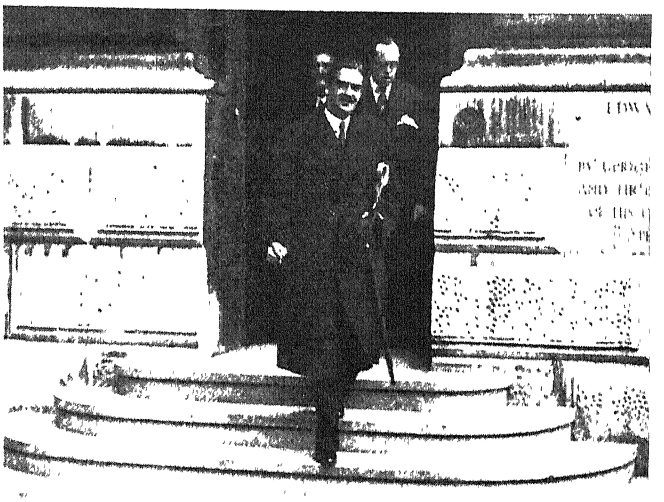
It will be seen, from the above table of shipments, that the trade in 1938 was smaller than it was in the preceding year, which, however, was not unexpected, because the United States was no longer an importer. At the same time, Europe's purchases were on a smaller scale, owing to Holland and Belgium partly substituting barley and rye for feeding purposes. Germany's imports, however, were large; the total for the ten months January to October was 8,213,000 quarters, compared with 9,931,000 imported in 1937.

On Oct. 1st, 1938, the German government abolished the law making compulsory the admixture of maize flour with wheat flour. Italian millers, however, are still compelled to mix in 10 per cent of maize flour with breadmaking flour. In order to prevent hurried marketings, and to assist growers financially, the United States government introduced a system of loans to growers. The loans range from 43 c. to 57 c. a bushel, according to locality.

Rye. Apart from Soviet Russia, whose crop suffered from drought over wide areas of the country, most countries of Europe enjoyed excellent growing conditions in the spring and summer of 1938. Germany and Poland, the two principal growers next to Soviet Russia, harvested the largest crops since 1933. The output in Germany was 38,860,000 quarters of 480 lb., and in Poland 31,830,000, compared with 31,260,000 and 25,930,000 quarters respectively in 1937. In 1938, the total European output, exclusive of Russia, was roundly 112 million quarters of 480 lb., which was 17 millions larger than in the preceding year; the average production in the five years 1933–37 was 103 million quarters. The ex-European crop in 1938 was 9,930,000 qrs., compared with 6,700,000, the average of the previous five years.

Oats. The most spectacular increase in crop production in the exporting group of countries occurred in Canada, where the 1938 output was nearly twelve million quarters of 320 lb. larger than in 1937. On the other hand, the United States was not so fortunate, the outturn there showing a reduction of ten and a half million quarters. The total world's crop, exclusive of Russia, was 346 million quarters, compared with 331 millions in the preceding year and 292 millions in 1936.

The principal exporting countries are Argentina, Canada, the United States, and Russia. The British market is almost the preserve of Canada, owing to the high duty on foreign oats. Imports into the United Kingdom in the cereal season, Aug. 1, 1937, to July 31, 1938, were 419,000 qrs., contrasted with two million as recently as the season ended 1933. About 76 per cent of the oats imported into the United Kingdom in 1938 came from Canada. Argentina mainly depends on Switzerland, Holland, and Belgium to take her surplus of roundly two and a half million quarters.



Barley. There are two classes of barley: the feeding and the brewing qualities. Some of the finest brewing sorts are grown on the Pacific coast of the United States and in Chile. Practically every country grows a certain percentage of malting barley, but the official crop estimates make no distinction between the respective qualities. It is, however, fairly safe to say that by far the largest part is feeding barley. In 1938, the world output, exclusive of Russia, but including China, was 230 million quarters of 400 lb, of which 90½ millions were harvested in Europe and 134½ millions in the ex-European countries of the northern hemisphere. The total crop in 1937 was 216½ million (revised), and in 1936, 218½ million quarters.

Brewers in the United Kingdom, in order to assist growers, have continued to carry out faithfully their undertaking to buy at least two million quarters of home-grown malting barley. In 1938, the total crop of the United Kingdom, including feeding qualities, was 4,700,000 quarters.

Rice. Of all the crops grown in India, there is none surpassing, or even equalling, rice in importance. The rice crop to India is what the wheat crop is to most other countries: it is the staple food for large numbers of the people. The success of the Indian crop depends largely on the monsoon rains of July and August. There are three crops in India, the chief of which is the winter crop. Planting of this takes place during May to August, and harvesting begins in the following December. The largest part of the crop is grown in Bengal, and next in importance is Madras. The 1938 crop was officially estimated at 26,544,000 tons of 2,240 lb., which was one million smaller than in the preceding year, although it was slightly above 25,700,000 tons, the average of the five years 1933–37. Japan's crop totalled 9,211,000 tons, compared with 9,353,000 in 1937 and 7,980,000 tons in 1936.

About average crops were harvested in the surplus-producing countries of Burma, Indo-China, and Siam. Their combined surplus for export in 1938 was estimated at six million tons, compared with 6,300,000, the average for the five years 1933–37. (G. P. B.)

GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF. Anyone who essays to write under this title cannot but be puzzled as to the limits of his subject. Nearly everything of importance that has happened to Great Britain in 1938 has, so to speak, happened elsewhere and hit the country from outside. It would be hard to find a year, since the death of Lord

Topical Press]
MR. EDEN LEAVING THE FOREIGN OFFICE AFTER HIS RESIGNATION IN FEBRUARY, 1938

Fox Photos]
AIR RAID PRECAUTIONS DEMONSTRATION AT NEWPORT, JUNE, 1938

Palmerston, in which strictly domestic British history had been more humdrum and less dramatic; no keen party warfare except over foreign policy, no ministerial crisis—except the resignation of a foreign secretary; no big extension of the administrative activities of the State—except in connexion with A.R.P. (Air Raid Precautions). Practically all public interests, public activities, all that is conventionally called "history", have been concentrated on two tasks, neither of which in a sensible world would occupy any time at all: the task of avoiding war and the task of preparing to wage it effectively if one cannot avoid it.

It therefore follows that the greater part of this article must be devoted to a general survey of outstanding events abroad, and more particularly their repercussions on the fortunes of Great Britain. Among such events those in Germany take the foremost place. There were not many months of 1938 in which something new and disturbing did not come out of Germany.

The Extinction of Austria. The first of these events, without which perhaps the others would not have occurred, was one of those purges which we have learnt to regard as inevitable growing-pains of dictatorship. At the beginning of February the German minister of war, the commander-in-chief, and thirteen generals were reported to have resigned. Hitler himself took over the command of the army, and Ribbentrop succeeded Neurath as foreign secretary. Thus ended a period of internal tension with the complete victory of the more aggressive forces within the Nazi system. The results were soon apparent. On Feb. 12 Hitler summoned Schuschnigg, the Austrian Chancellor, to his residence at Berchtesgaden, just outside the Austrian frontier, and demanded the appointment of an Austrian National-Socialist, Seyss-Inquart, as minister of the interior. For many months previously the Nazi agitation within Austria, encouraged from across the frontier, had been embarrassing the Schuschnigg government. To accept Hitler's demand was to surrender, in effect, the control of Austrian police: to refuse it meant extinction. Schuschnigg accepted, but it may be doubted whether the German government intended this Berchtesgaden agreement to be more than what Bismarck once called a papering over the cracks. Offensive utterances from the German press, which is in effect the German government, continued. On March 9 Schuschnigg attempted to escape from the toils by holding a plebiscite. On the 11th the two National Socialist members of the Austrian cabinet, acting on orders from Germany, demanded the calling off of the plebiscite, whereupon Schuschnigg resigned. On the 12th, German troops entered Austria. On the 13th Austria was annexed to Germany. Schuschnigg spent the remainder of the year a prisoner.

To the historically minded this event suggested long views. The wheel had come full circle Once again what had been established by a Holy Roman Emperor nearly a thousand years before as an Ost-Mark, or eastern frontier province, had resumed that humble role, after passing through a bewildering variety of phases, in one of which the Austrian Habsburg dynasty had sought to dominate, unite, and Catholicize the miscellany of German provinces, and in another of which these same Habsburgs had made a multi-national Empire which nearly but never quite reached the Black Sea and the Aegean. What was more practically important was the reflection that these same Austrians of post-war Austria were Germans, and that (quite apart from the ridiculous statistics of the totalitarian plebiscite which followed) the majority of them doubtless welcomed this inevitable ending of an impossible experiment. The post-war Austria had never stood on its own legs, and many of those who now denounced Hitler's brutal methods had nineteen years before denounced the Allied victors at Versailles for refusing the *Anschluss* (union) then demanded. There was, of course, an Austrian minority, and under German rule minorities get no mercy. Vienna contains (or contained) more Jews than any other German city, having one of the three largest Jewish urban aggregations on the Continent.

It was a striking fact that the fulfilling of this item in the programme of *Mein Kampf* exactly coincided in date with a temporary eclipse of Germany's chief continental rivals. In France M. Chautemp's government fell on March 10, and was not replaced till the 13th by a very weak government of M. Blum, which, after 26 days, gave place to the government of M. Daladier. From March 2 to 13 Russia was occupied with one of those extraordinary State trials which, whatever may be their real significance, have undermined the efficiency of the country, decreased the attractions of communism, and made people wonder what manner of creature Stalin may really be.

Mr. Chamberlain's Foreign Policy. Not for these reasons, but on the merits of the case the British government accepted a change of frontiers which, however regrettable

the manner of its making, was clearly acceptable to the majority of the inhabitants concerned None the less, the much more difficult question of the three million Sudeten Germans in Czechoslovakia would obviously brook no long delay, and to this subject Mr. Chamberlain addressed himself in a speech on March 24 He categorically refused to give any guarantee either to Czechoslovakia or indirectly to France that Great Britain would maintain, if necessary by war, the integrity of the former country. None the less, he pointed out that if war broke out on such an issue, "it would be well within the bounds of probability that other countries besides those which were parties to the original dispute would almost immediately become involved".

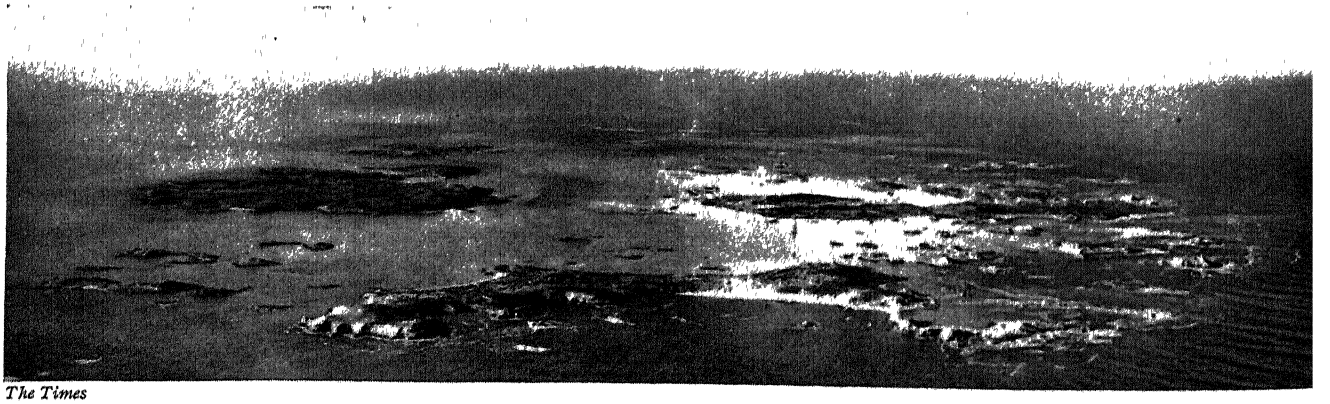
When he spoke these words Mr Chamberlain was already in the public eye, the minister in charge of British foreign policy Mr. Eden, who had occupied that position ever since the downfall of Sir Samuel Hoare on the Abyssinian question in Dec. 1935, resigned on Feb 20 The question at issue had apparently been Mr. Eden's reluctance to respond to Mussolini's demand for the negotiation of an Anglo-Italian Treaty. Principal author of the sanctions policy which had antagonized Italy without saving Abyssinia, Mr. Eden was too closely identified with an "ideological front" to suit Mr Chamberlain, who was determined, if possible, to break down the fatal cleavage between democracies and dictatorships Lord Halifax succeeded Mr. Eden as foreign secretary, but left the limelight to his chief, which was perhaps as well in an age of "Fuhrers", "Duces", and national personifications.

Hitler and Czechoslovakia. If Hitler showed himself impatient to apply his methods to Czechoslovakia, his excuse would be that in this matter the Sudeten Germans had been living on broken promises for twenty years. Masaryk and Beneš in 1918 had used the defeat of Germany and the break up of Austria-Hungary to establish a Czech predominance over all Bohemia, as well as other provinces farther east. The Czech government promised, from the first, many things to their German and other minorities, and indeed they treated them very much better than, for example, Hitler's government treated Jews—but they did not fulfil their promises. The Sudeten Germans, a quiet, unambitious folk, who had once been ruled from Vienna but never from Berlin, had no particular desire for absorption in the Third Reich, but they undoubtedly pined for the removal of many petty economic and administrative injustices; and the overwhelming might of the New Germany, Hitler standing behind their local leader Henlein—"in shining armour" as an earlier Führer said on a famous occasion—could hardly fail to turn despair into hope and petitions into demands. This was a situation exactly suited to Hitler's programme. Posing as a champion of distressed minorities, a cause against which few Englishmen not blinded by ideological passions would fight with an easy conscience, he could not only add three more million Germans to the Reich, and gratify Hungary and Poland by allowing them also their pounds of flesh (or parts of them) at the expense of the doomed republic; he would at the same time inevitably leave what remained of Czechoslovakia in so raw, bleeding, and defenceless a condition, that what had been an offensive outpost of the Franco-Russian alliance would henceforth inevitably be a humble satellite of Germany. The narrowed waist of the state could be pierced by an "all-German" road uniting Breslau and Vienna, and its long tail might be made the avenue of a new German eastward expansion, like that summarized before the war in the phrase Berlin–Baghdad—though assuredly the new expansion will not get to Baghdad unless Ataturk's successor proves a failure.

Anglo-French Relations. It may be some years before the earlier stages of Anglo-French reactions to the Czech problem can be accurately traced. At the end of April the French prime minister and foreign secretary visited London. It is asserted by some authorities that Europe was on the verge of war on May 20 The Sudeten leader, in his new Hitler-fed mood, made negotiations with Prague for a settlement within Czechoslovakia almost impossible. Hitler and Mussolini had recently staged an exhibition of totalitarian union in Rome. Pressure exercised on the government of Dr Beneš moved it several stages farther towards the concessions it had suicidally opposed for nearly twenty years, and it may have been at this stage that France discovered that she could not fulfil, and would prefer not to try and fail to fulfil, the pledges she had given to Czechoslovakia. One of the tasks of Mr Chamberlain in the months that followed was to use the prestige of his government (which had plenty of prestige and no pledges to break) to cover the withdrawal of the French government, embarrassed by reiterated pledges and enjoying no more prestige than French governments usually enjoy, from a position which, if held, would have meant general war and the worst of fates for all, and not least for the Czechs in the forefront of the battle, separated from their allies by the full width of Germany and from Russian support, whatever that would have been worth, by the width of Poland or Rumania.

Events leading up to the Crisis. The usual German methods, subjecting the threatened state to internal disturbance and a press campaign of incredible virulence, were pursued throughout the midsummer. The dispatch of the Runciman mission at the end of July seemed at the time a happy stroke of policy, and produced an immediate lowering of temperature; for even at that date, according to the Sudeten leader Henlein, the question was still one of a greater or less degree of German autonomy within the old Czech frontiers. In his final report, written on terminating his mission in the middle of September, Lord Runciman expressed a doubt whether any solution on these lines could have proved feasible at this late stage. In any case, Hitler took control of Henlein and assured its failure in advance. On Aug. 13 German army manœuvres on an

Topical Press]
MR. CHAMBERLAIN LEAVING HESTON FOR THE MUNICH CONFERENCE



unprecedented scale were begun, and from this moment Germany enjoyed, under a thin veil of annual routine, the advantages of mobilization. On Sept. 5 the Fuhrer addressed the annual party rally at Nuremberg in terms expressive of an almost insane hatred for Dr. Beneš and the Czechs. On Sept. 7 *The Times* published a leading article tentatively suggesting that a revision of Czechoslovakian frontiers might turn out to be the safest and fairest solution of the problem. The article at once became notorious in the eyes of those who disagreed with it, but in retrospect what seems remarkable is that a weighty statement of this view should have been delayed so long. Mr. Chamberlain is not the sort of statesman that takes his policy from newspapers, and the counter-suggestion that he directly or indirectly inspired the writing of the article has been categorically denied. None the less, the article and the flood of comment that it let loose gave the public a brief week of preparation for the policy Mr. Chamberlain was to pursue on his visits to Germany, the first of which took place only eight days later.

Mr. Chamberlain's Visits to Germany. On Sept. 12 Hitler undertook to support with arms the claims of the Sudeten Germans. On the next day the Czech government ordained martial law in the Sudeten area. With war staring him in the face, Mr. Chamberlain flew to Berchtesgaden on the 15th. At this meeting Hitler revealed for the first time a plain demand for the cession to Germany of all districts with a German majority. Having secured from his own government and the rulers of France and Czechoslovakia an acceptance in principle of this demand, Mr. Chamberlain returned to meet Hitler, this time at Godesberg, on the 22nd, to be confronted with the demand that the new frontiers should be fixed by Germany alone, and that they should be occupied by the German army with no more than one week's delay. For an unforgettable week war seemed inevitable, and Mr. Chamberlain's speech in the House of Commons seemed in strict succession to that of Sir Edward Grey on Aug. 3, 1914, until its sensational conclusion announcing Hitler's invitation to the Four Power Conference at Munich. The Munich Agreement was signed on the 30th and accepted by Czechoslovakia on the same day.

After the Crisis. For the moment the sensation of escape expressed itself in an ovation to Mr. Chamberlain, in Great Britain and over the greater part of the world, such as perhaps no statesman had ever received before. But the meeting of parliament a few days later revealed a deep and bitter cleavage of opinion in which, for example, Mr. Churchill and the Labour leaders found themselves at one in denouncing a policy which had led to peace only through humiliation. There had undoubtedly been a resounding triumph, not only for Germany, but also for German methods, which are in themselves incompatible with international security. On the other hand, a large and indefensible section of the Versailles settlement had been removed without war, and the intensity of the desire for peace of all peoples, not excluding the Germans, had been made plain in a manner that even dictators could not fail to see. Unhappily, the leading events of the autumn in Germany, the hideous persecution of the Jews and the press campaign of vilification directed against British statesmen showed that there had been no change of heart so far as the rulers of Germany were concerned. Before passing to other subjects, one may mention that British charity, having raised a fund of £300,000 for Czechoslovakian relief in the autumn, contributed another £250,000 in the last three weeks of the year in response to Lord Baldwin's appeal for the Jews.

The narration of these events has taken up much of the space allotted to this article, but not more, it may be hazarded, than they will occupy relatively to the rest in the eyes of posterity. These other events must now be briefly reviewed, first those in the field of foreign policy and finally domestic events.

Anglo-Italian Agreement. In the affairs of Central Europe, Hitler secured and maintained the initiative. In the Mediterranean the British government enjoyed greater freedom in the pursuit of its own policy. The chief result of this policy was the Anglo-Italian Agreement signed in April, a month after the German occupation of Austria, and brought into force in November, after a "token" detachment of 10,000 Italian legionaries had been withdrawn from Spain. Hostility between the two countries dated from the ill-fated "sanctions" directed against Italy by members of the League of Nations in the autumn of 1935, with the object of preventing the conquest of Abyssinia. Since that time Italy had sought a revenge by Arabic broadcasts designed to stimulate the Arab revolt against British government in Palestine. Italian activities were also perhaps the principal obstacle to the enforcement of the British policy of non-intervention in the Spanish civil war. The agreement dealt with these questions, and with questions of sea power and security in the Mediterranean. Great Britain undertook to secure and subsequently secured the recognition by League members of the new Italian Empire in Africa. When the agreement was signed it was hoped that the Spanish civil war was nearly over, and the agreement was to come into force only when all Italian forces in Spain had been withdrawn. This seemed likely to mean an indefinite postponement which

The Times

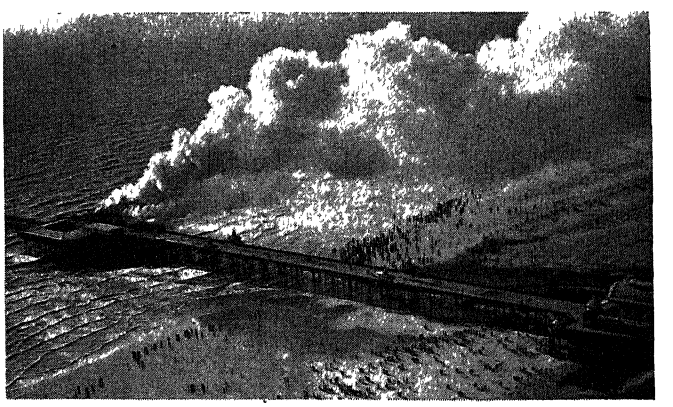
THE SCILLY ISLES

Topical Press]
L TO R . M BONNET, M DALADIER, AND GENERAL GAMELIN, AT NO 10, DOWNING STREET, SEPT. 26, 1938

neither country desired, and, as mentioned above, a "token" withdrawal of 10,000 men was accepted instead

The Spanish Civil War. As for the Spanish war, at the end of the year General Franco, who had obstructed all plans for agreed withdrawal of foreigners from both sides, seemed once again to be pressing forward, but his ambitions involved him in a curious dilemma. It was difficult to crush Barcelona unless he enjoyed the belligerent rights which would entitle him to enforce a naval blockade He can only secure such belligerent rights by sending home his Italian aircraft, which seem as indispensable for his purpose as belligerent rights.

Italy and France. Improved relations between Italy and Great Britain have not been followed, as was hoped, by improved relations between Italy and France. Indeed, in the last weeks of the year the Italian government let loose a "spontaneous" popular demand for the surrender to Italy of Tunisia, Corsica, and Nice, which may prove a smoke screen to cover more reasonable demands for better trading facilities at the French port of Jibuti, where the Abyssinian railway reaches the sea.



Palestine. The problem of doing justice to the conflicting claims of Jews and Arabs in Palestine continued to prove insoluble. First, British incompetence in tolerating the Arab insurrection and later, British brutality in suppressing it, were favourite subjects of German propaganda. The Royal Commission, under the chairmanship of Lord Peel, had in the previous year reported in favour of a scheme of partitioning the country between the Jews and the Arabs, but a second Commission, sent out in 1938 to study the details involved, reached the conclusion that any scheme of partition would prove financially unworkable, all the wealth being in the Jewish areas. Partition was therefore abandoned and the government fell back on the plan of a Round Table Conference in London, to which not only Jews and Arabs of Palestine, but representatives of Jew and Arab interests from outside, have been invited

The Far East. In the Far East the Japanese invasion of China has continued, and the invaders have occupied Canton and Hankow without, apparently, bringing a Chinese collapse any nearer. The future of British interests in China is inevitably problematical, but at least the long-prepared Singapore naval base was, in February, formally inaugurated.

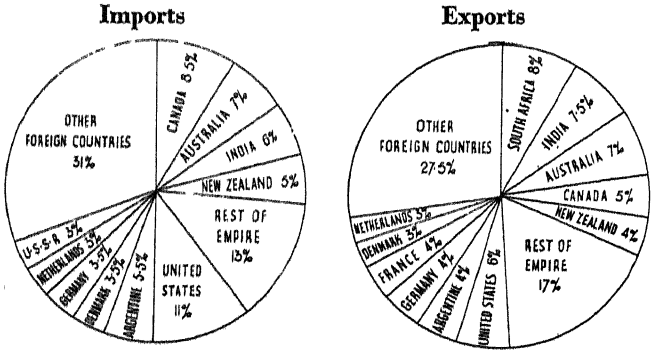
Anglo-Irish Agreement. Coming nearer home, the Anglo-Irish Agreement, signed in April, brought to an end to the advantage of both parties a quarrel which had begun five years before, when Mr. de Valera, on acceding to office, proceeded to withhold the land annuity payments agreed under the Treaty of 1921 In Northern Ireland the fear that Mr de Valera would raise the question of partition in the negotiations with Great Britain led Lord Craigavon to advance the date of the next election and thus give one more exhibition of the strong majority feeling in the six counties against union with the Free State. This was perhaps unnecessary, and it certainly seems to have been regarded by the Nationalists in the six counties as provocative In a subsequent speech, Mr de Valera refused to admit the finality of the partition, but disclaimed any desire to end it by any but pacific and constitutional means.

Turkish and American Agreements. In May an Anglo-Turkish agreement marked the steady progress that had been made for some years past in the political and economic relations of Great Britain with one of the best administered of the Dictator States, a State which virtually owed its existence to its successful defiance of a part of the post-war settlement for which Great Britain had been particularly responsible. Again, in November the long-negotiated Anglo-American Commercial Treaty was at last brought to a completion. Valuable as a moral gesture at a moment when the German press was insulting the governments of both countries, it also involves concessions to British exports which should prove of very substantial importance. These four treaties, with Italy, the Irish Free State, Turkey, and the United States, should be set against the gloomy and menacing impression which other and more conspicuous events have left on the public mind.

Rearmament. At home the time and energies of parliament have been occupied, to an extent unprecedented except during the Great War years, with debates on foreign affairs and the acceleration of rearmament in all its branches; most of all perhaps the novel and baffling problems of what can hardly be called rearmament, since it is an entirely new undertaking, namely, air-raid precautions. Whether the crisis of September found our air-raid precautions as rudimentary and chaotic, either by absolute standards or in comparison with those of other countries, as critics suggested, is a matter of dispute There is no dispute that the crisis enormously quickened the study of the problem and the execution of appropriate measures. It may be safely said that no degree of such precautions will ever be immune from criticism. War, if it comes, must be horribly destructive, and, under modern conditions, the civilian population at home will be in the firing line as well as the fighting services The budget raised the income-tax to 5*s.* 6*d.*, and towards the end of the year the Chancellor of the Exchequer announced that the government's authority to borrow would

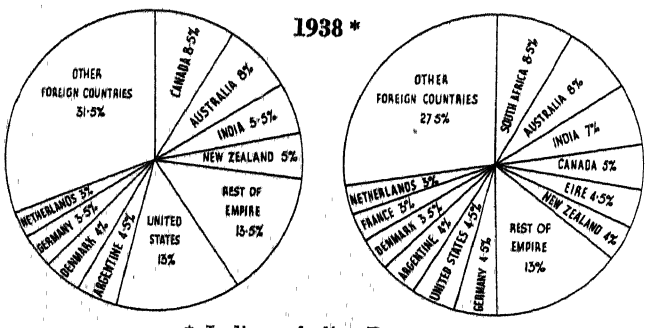
Topical Press]
BLACKPOOL: THE PAVILION ABLAZE, JUNE 19, 1938

be extended. Sir John Anderson, an ex-civil servant and former Governor of Bengal, was appointed Lord Privy Seal, and put in charge of air-raid precautions. A voluntary National Service Register is to be compiled. The "Sandys question", in itself rather a storm in a tea-cup, illustrated the keenness of a private member to expose the alleged inefficiency of a war minister, and the difficulty of reconciling the rights of M.P.'s with the terms of the Official Secrets Act.



Legislation and Industry. In the sphere of legislation unconnected with danger from abroad, the most notable measures were a keenly contested Coal Act, transferring mining royalties from private ownership to a Coal Commission; an Act extending the powers of the Milk Marketing Board, and an Act to expedite the campaign against urban overcrowding.

Industrially the year was a quiet one. Trade was naturally affected by the disturbed conditions, and the figures of unemployment rose, though not as greatly as was at one time feared. The number unemployed was about 150,000 more at the end of the year than the beginning, an increase of about nine per cent. The movement for granting weekly wage-earners holidays with pay continued its rapid expansion, assisted by an Enabling Act. Indeed, it is becoming apparent that, with so many more millions taking annual holidays, it is quite impossible that they should all take their holidays at the acceptable places (mostly on the coast) at the same time, and proposals are advanced for some system of "staggering" the holiday season by spreading it all over the summer months—which is not as easy as it may sound.



The Glasgow Exhibition. In Scotland, the most notable event of the year was the extremely successful Glasgow Exhibition, which was attended by over 12,000,000 persons, three times the total population of Scotland—though of course the "persons" attending the Exhibition were not all different individuals. (D. C. So.)

GREECE. On Jan. 28, twelve party leaders, including four ex-premiers, and three officers were arrested and interned, following the issue of a manifesto which criticized the government and called for the re-establishment of political freedom. Other deportations followed, including that of M. Michalakopoulos. General Metaxas now declared that he would institute a regime of "entirely pitiless severity", and further repressive laws followed, the regime becoming progressively more Fascist. The repression was accompanied by considerable social legislation and the inauguration of public works, civil and military. A further revolt in Crete, led by a nephew of the late M. Venizelos (July 29), was quickly and easily suppressed.

A new treaty of friendship and neutrality was concluded with Turkey (April 27) and a pact with Bulgaria (*q.v.*) on July 31. Following the latter, Greek troops occupied the demilitarized zone in West Thrace (Aug. 21). (C. A. M.)

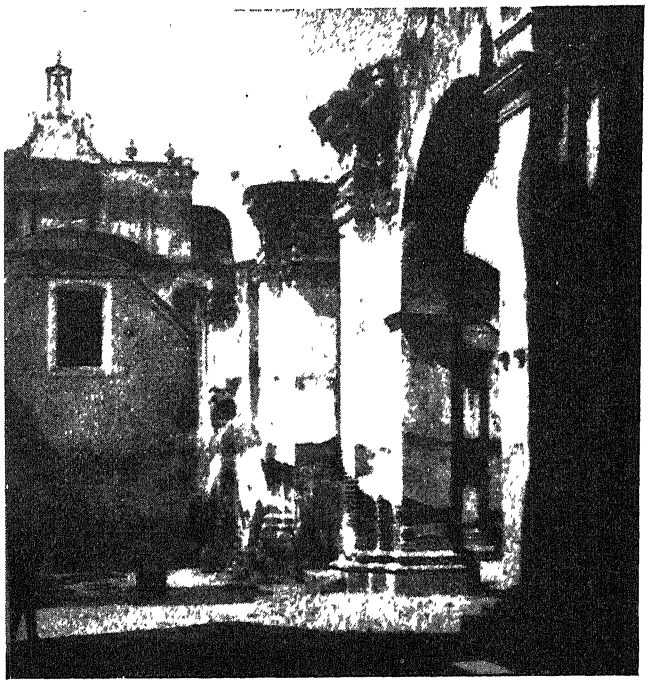
GREYHOUND RACING. By 1938 there were 61 race-courses in Great Britain affiliated to the National Greyhound Racing Society and running under the rules of the National Greyhound Racing Club, and this number is likely to increase during 1939. In and around London there are some 22 tracks, of which fourteen come under the club's rules; attendances at the 22 were approximately 11,000,000 for the year, and at all tracks throughout the country (approximately 150) about 30,000,000. Since the club was formed in 1928 its registry department has collected details of over 60,000 greyhounds and the names of over 30,000 owners; during the year its new registrations included over 2,000 owners and 4,000 greyhounds.

Prize money distributed shows an increase during 1938, and now amounts, on N.G.R.C. tracks alone, to over £400,000 per annum. Many important races carry over £1,000, the richest (£3,500) being the "White City Stakes", an invitation race for the best six greyhounds of the year, run annually at the White City Stadium, London. The following table shows the results of the principal events during the year :

Race	Stadium	Greyhound
Grand National, 525 *yds., hurdles*	White City, *May* 21	GROSVENOR BOB, *Mr. Flintham*
Gold Collar, 440 *yds., flat*	Catford, *May* 28	JUNIOR CLASSIC, *Mr. Cleaver*
Greyhound Derby, 525 *yds., flat*	White City, *June* 25	LONE KEEL, *Mr. Walsh*
Scurry Gold Cup, 400 *yds., flat*	Clapton, *July* 23	ORLUCK'S BEST, *Mr. Leach*
Laurels, 500 *yds., flat*	Wimbledon, *Aug.* 12	BALLYHENNESSY SANDHILLS, *Mrs. Cearns*
Oaks, 525 *yds., flat (bitches)*	White City, *Sept.* 10	QUARTER DAY, *Mr. Flintham*
St. Leger, 700 *yds., flat*	Wembley, *Sept.* 19	GRETA ROSARY, *Mrs. Goodchild*
Cesarewitch, 600 *yds., flat*	West Ham, *Dec.* 12	BALLYJOKER, *Mrs. Cearns*

Racing is flourishing in the U.S.A., Australia, and France. In France the sport is controlled by the State through a body analogous to the N.G.R.C.

GREY OWL (Wa-Sha-Quon-Asin), North American Indian author and naturalist, died at Prince Albert, Saskatchewan, on April 13, 1938. He was chief conservation officer of the Prince Albert National Park. Much uncertainty exists as to the date and place of his birth, and even as to his Indian blood, among the various opinions held are that he was the son of a Scotsman named MacNeill and an Apache woman, that he was born in Mexico on Sept 19, 1888; that he was the son of a planter named Belaney and was born at Hastings on Sept. 18, 1888 Whatever may be the truth, it is a fact that Grey Owl was accepted as one of themselves by the Indians with whom he associated, including his Indian wife. Among his publications were *The Men of the Last Frontier* (1932), *The Adventures of Sajo and her Beaver People* (1935), and *Tales of an Empty Cabin* (1936).



GUADELOUPE, a French West Indian colony comprising the large adjacent islands of Basse-Terre and Grande-Terre and several minor islands of the Windward group, governor, Felix Éboué. Area 688 sq. miles, population (official 1936) 302,659, chief cities (with 1931 populations) Basse-Terre, the capital, 9,268, Pointe-à-Pitre, 30,465, Le Moule, 17,107. During 1938 the general council approved a programme of public works calling for expenditure over a period of years of 278 million francs, including large outlays for highway improvement, sanitation, harbour development at Pointe-à-Pitre, and low-cost housing. Imports in 1937 were 194,900,000 francs (61·4 per cent from France), exports 294,500,000 francs (97·7 per cent), and in the first eleven months of 1938, 198,400,000 francs and 294,200,000 francs, respectively. Imports are foodstuffs, textiles, beverages, and lumber; exports are sugar and rum, bananas, vanilla, and cacao. (L. W. Be.)

GUAM, a possession of the United States of America and the largest and most populous island of the Marianas, lies at the southern end of that group, approximately 1,500 miles east from Manila; area about 225 sq. miles; population on July 1, 1938, 22,314, including 20,880 natives of Guam who are called Chamorros; the remainder are foreign-born and personnel of the United States Naval Establishment. The capital and only city is Agana.

The island was a Spanish possession until 1898, when it was captured by the United States. Since acquisition it has been under the jurisdiction of the Navy Department, with a naval officer commissioned as governor.

Public schools had an average attendance of 4,066 during 1937–38. All medical attention is given by the naval medical officers, who treat the people free of charge. Copra is the only export of importance: 1,655 tons were exported during the fiscal year 1938.

GUATEMALA, the largest of the Central American republics; language, Spanish; capital, Guatemala city; President, Jorge Ubico. Area 48,290 sq. miles; population (est. Dec. 31, 1937) 2,466,227. The leading cities are: Guatemala City, 116,000 (est.); Quezaltenango, 37,000 (est.); Totanicopan, 30,000 (est.), Cobán, 27,000. During 1938 Guatemala continued quiet under the quasi-dictatorship of President Jorge Ubico. On April 9 a treaty was concluded with El Salvador defining their mutual boundary. Despite the chaotic condition of the world coffee market, coffee exports during the year were maintained with a slight increase in volume, although with some decline in price. In 1937 total imports were 16,742,907 quetzales, representing a 45 per cent increase, and exports 16,108,610 quetzales, a 7 per cent increase. The United States holds a commanding position in Guatemalan foreign trade. Trade

John Armstrong]
ANTIGUA, ANCIENT CAPITAL OF GUATEMALA

in 1938 expanded slightly. Guatemala has 850 miles of railway and 3,472 miles of highway, with 887 miles under construction. Steamship and air services provide external communication. Coffee (production: 102,961,491 lb. in 1936–37) is the chief product and export Bananas, the second export, increased 17·6 per cent in 1937. Coffee and bananas comprise 90 per cent of all exports, with chicle the only other commodity of consequence. There is some manufacturing for domestic consumption The monetary unit is the quetzal (value: approx. $1 U.S.). In 1936–37 government revenues were the highest since 1930 ($11,605,000); expenditures were $9,853,000. The 1937–38 budget called for $9,788,500. There are over 2,500 schools, with an enrolment in excess of 145,000. In 1937–38, 15 per cent of government expenditures went to education, making the sixth consecutive year of increase. Guatemala has conscription and an army of 7,000. (L. W. Be.)

GUIANA: *see* British Guiana; French Guiana; Surinam.

GUJARAT STATES are a group of small principalities in the N. of Bombay which, when they were recently brought into direct relation with the Governor-General, were placed under the superintendence of the Resident in Baroda (Col. E. J. D. Colvin). Area 7,541 sq. miles; pop. 1,272,168. Rajpipla is the best-known of the group, with about thirty smaller chieftainships.

GUSTAVUS (Gustav) **V** (1858–), of whom a biographical account will be found in the *Ency. Brit.*, vol. 11, p. 11, has been king of Sweden since 1907, and is the oldest reigning monarch, though he is exceeded in length of regnal years by the rulers of Holland (*see* Wilhelmina), Italy, and Norway. He ascended the throne in 1907, and on Dec. 8, 1932, Silver Jubilee celebrations were held throughout the country with an enthusiasm that was surpassed only by that with which his eightieth birthday was celebrated on June 16, 1938, when the Kings of Denmark and Norway and the president of Finland attended at Stockholm to convey the congratulations of their peoples.

On his seventieth birthday (1928) he devoted the national subscription of five million kronor that was presented to him to the endowment of cancer research; on his eightieth birthday he applied a subscription of a similar amount to combating rheumatic diseases.

King Gustaf, who suffered severely through the death of his consort, Queen Victoria, at Rome, on April 4, 1930, is still extremely active, and rarely misses his daily game of tennis, and on the day after his very tiring birthday a film was taken of him playing. His Majesty spends most of the winter on the Riviera, and on his return at the end of April, 1938, he visited Berlin, entertaining Field-Marshal Göring, Herr von Ribbentrop, and others at the legation. Throughout his reign he has shown himself a liberal ruler, agreeing to various amendments of the constitution, among others to universal and female suffrage, and to the removal of the ban prohibiting marriage between a prince and the daughter of a foreign commoner.

GWALIOR is the largest state in Central India; area 26,367 sq. miles; pop. 3,500,000. Under the late ruler, an enlightened policy of progress was pursued, and the beginnings of free institutions were made. In 1938 the present Maharaja (H.H. George Jiwaji Rao Scindia) made his first public appearance since his investiture in 1937, and took the occasion to promise enlarged powers to the legislature which had come into existence in the previous year.

(ME.)

GYNÆCOLOGY AND OBSTETRICS. The maternal mortality rate in England and Wales during the four years 1934 to 1937 has declined steadily from 4·41 per 1,000 total births in 1934 to 3·13 in 1937.[1] The 1937 rate is the lowest recorded since the present classification was adopted, that is, over a period of twenty-seven years. The mortality rates, both from puerperal sepsis and causes other than puerperal sepsis, have shared in this declension. The former has dropped sharply from 1·95 per 1,000 total births in 1934 to 0·94 in 1937, the latter from 2·47 in 1934 to 2·19 in 1937. From these figures there is reason to believe that the persistently high rate -for many years a cause of serious public concern -has at last responded to the administrative and other measures directed against it. It is significant that the sepsis death-rate has declined by about fifty per cent, and it has been suggested with some reason that this, in part at least, is explained by the well-established efficacy of the sulphonilamide drugs in the treatment of those types of puerperal sepsis which are due to the hæmolytic streptococcus.

During recent years much scattered work has dealt with the influence of nutrition on maternal mortality and morbidity. Whilst more investigation is urgently required before we can pronounce on some of the more important general questions underlying maternal nutrition, we already have information of value on specific matters. Thus, it is now recognized that much of the widespread anæmia occurring both during and after pregnancy is due to the swallowing up of the low iron reserves in women whose diet is defective in this mineral. Then, again, the polyneuritis of pregnancy, sporadic in all countries and endemic in some, is similarly related to B1 deficiency. The work of Preston Maxwell in China has, likewise, demonstrated the primary part played by deficiency of the Vitamin D and calcium-phosphorus intake in osteomalacia and adolescent rickets.

One of the most urgent problems awaiting solution is the influence of maternal nutrition on fœtal mortality and morbidity. Preston Maxwell has shown conclusively that children of osteomalacic women may be rickety at birth, and much interesting work is being carried on to determine how far the less extreme ranges of deficiency in maternal nutrition known to be prevalent in most western communities may undermine the health and stature of the oncoming generation. Thus, Finola, Trump, and Grimson have given evidence to show that the skull, rib, and limb bones of children can be modified by the addition of Vitamin D, calcium, and phosphorus to the mother's diet.[2]

The work of Evans has shown Vitamin E, the fertility vitamin, to be essential for the healthy development of the animal fœtus, and recent study on the successful treatment of women who tend to abort habitually suggests the importance of this vitamin also in the physiology of human pregnancy. The development of cretinism in rats born of mothers fed on a diet defective in Vitamin E raises some fascinating possibilities in human pathology (Barrie). Recent work (Rowland and Singer) suggests that this vitamin may exert its influence through the anterior pituitary gland.

Some recent investigations on fœtal physiology go far to upset the traditional view that the child does not and dare not breathe before birth. Bonar and others have claimed to show that the fœtus *in utero* carries out respiratory movements with the production of a tidal flow of amniotic fluid in the lungs.[3] Such a mechanism would easily account for the occasional occurrence of antenatal pneumonia.

The sex endocrinologist occupies a prominent place in current medical literature. Dodds, Lawson, and Noble[4] have described the biological effects of a new synthetic œstrogenic substance (diethylstilbœstrol), which in ovariectomized rats was found to be two and a half times as powerful as œstrone. Its special importance lies in the fact that it is more effective than previous œstrogenic substances when taken by mouth and that its discovery may lead within a short time to the placing on the market of a cheap, active, and convenient drug.

Sheehan has shown that massive necrosis of the anterior part of the pituitary gland is apt to be found in women dying from puerperal hæmorrhage, and has given reason for the view that Simmond's Disease (a chronic disease associated with marked physical and mental disturbance) is generally due to a similar lesion which, being of lesser extent, is consistent with survival.

One of the most fascinating developments in recent sexual physiology is found in the evidence that a special area at the base of the brain (hypothalamus) contiguous to the pituitary gland is concerned directly and intimately with the whole complex—physical, mental, and psychical—of the sexual process and its manifestations.

H

HÁCHA, EMIL, LL.D (1872–), president of Czechoslovakia, was born at Trhové Sviny, Bohemia, the son of a tax administration official, and was educated at Budějovice (Budweiss) and the Charles University, Prague, where he studied law. He gained his doctorate in 1896, and from 1898 till Dec. 1916, when he became court counsellor at the administrative court of Vienna, was in the service of the provincial committee of the kingdom of Bohemia. After the revolution of 1918 he became (Nov. 23) senate's president of the Prague administrative court in the newly established republic of Czechoslovakia, becoming second president in March 1919 and first president of the supreme administrative court in 1925. On Nov 30, 1938, following the resignation of Dr. Beneš and the interim government of General Sirový (*qq v.*), Dr. Hácha was elected president by 272 votes out of 312 ; he received the resignation of General Sirový that afternoon, and on the following day appointed a new government under M. Beran

Dr. Hácha, who for long was a member of the Permanent Court of Arbitration at The Hague, has an international reputation as a lawyer. He is a fluent speaker of both English and German, and has published Czech translations of books by Kipling, Stevenson, and Jerome K. Jerome ; he has also taken a keen interest in the fine arts, and from 1906 to 1916 was secretary to the directors of the modern Gallery at Prague (of which he is still a director), and was largely responsible for the housing and cataloguing of the collections.

Dr. Hácha is a Roman Catholic ; he was left a widower, with one daughter, early in 1938.

Keystone

DR. HÁCHA AND GENERAL SIROVÝ

HAIG, SIR (THOMAS) WOLSELEY, British administrator and orientalist, was born on Aug. 7, 1865, and died in London on April 28, 1938. He was educated at Wellington College and Sandhurst, and saw service in Upper Burma from 1887 to 1889. In 1892 he was appointed to the Berar Commission, which administered the Assigned Dominions of the Nizam of Hyderabad, and in 1901 became First Assistant to the Resident at Hyderabad. In 1907 he was appointed Assistant Secretary to the Government of India, Foreign Department. From 1910 until his retirement in 1920 he was mainly in Persia, where he dealt with many a difficult situation with conspicuous tact and ability. After returning to England, he held posts as professor of Arabic, Persian, and Hindustani at Trinity College, Dublin, and as lecturer in Persian at the School of Oriental Studies, London University. He was appointed March Pursuivant of Arms in Scotland in 1923, and from 1927 to 1935 was Albany Herald. He was created a K.C.I.E. in 1922. His publications included many important translations of oriental historical works, and he edited the third and fourth volumes of the *Cambridge History of India.*

HAITI. West Indian republic occupying the western third of Hispaniola ; language, French ; president, Stenio Vincent. Area 10,204 sq. miles ; population (almost entirely Negro), 3,000,000 (1938 estimate). Chief cities : Port-au-Prince, the capital, 125,000 ; Cap Haitian, 14,000.

The nationalistic policies of Cuba and the Dominican Republic during 1937 compelled repatriation of Haitian immigrants. The extreme violence accompanying their forcible expulsion by the Dominican government in October and November 1937, in which an estimated 10,000 or more Haitians were killed, precipitated serious tension. The question was submitted to Pan-American arbitration under the " Gondra treaty " of 1923 (Jan. 19, 1938), and on Jan. 31, Haiti was awarded an indemnity of $750,000.

Education. There are over 400 primary and secondary schools, with a total enrolment in excess of 50,000 The university of Haiti, at Port-au-Prince, held its first international summer session in 1938

Finance. The monetary unit is the gourde, fixed by law at 20 cents United States The public debt on Sept 30, 1938, was 43,950,000 gourdes, a decline of 387,000 gourdes in 12 months. Fiscal control is in the hands of a financial adviser nominated by the President of the United States

Trade and Communication. There are 164 miles of railway and over 1,000 miles of motor highway. In 1937, imports were $9,215,132, an increase of 22 per cent. Exports totalled $8,970,890, a 6 per cent decrease. For the fiscal year ending Sept. 30, 1938, total foreign trade was $14,541,200, the lowest in 21 years. Imports were $7,594,800 and exports $6,946,400. The decline in exports was primarily one of value, rather than of volume. Owing to falling prices, amortization of Haiti's debt was partially suspended by agreement with the United States in January. (*See* also DOMINICAN REPUBLIC.) (L. W. BE.)

HALE, GEORGE ELLERY, American astronomer, was born in Chicago on June 29, 1868, and died at Pasadena,

California, on Feb. 22, 1938. An account of his life and work may be found in the *Ency. Brit.*, vol. 11, p. 87. It was on Dr. Hale's persuasion that, in 1928, the International Education Board provided funds for building a 200-inch telescope, and in 1935 the great disc of this instrument was taken from the electric incubator where it had been cooling for twelve months. Dr. Hale did not live to see the completion of this telescope, which, at the time of his death, was being expected at Mount Palomar, California. In 1932 the Royal Society awarded Dr. Hale the Copley Medal.

HALIFAX, EDWARD FREDERICK LINDLEY WOOD, K.G., 3RD VISCOUNT (1881–), British statesman, of whom, as the first baron Irwin, a biographical notice will be found in the *Ency. Brit.*, vol. 12, p. 696. After completing, in 1931, his term as Viceroy of India, he became for the second time President of the Board of Education (1932), and since 1935 has been leader of the House of Lords, holding office successively as Secretary of State for War, Lord Privy Seal, and (May 1937) Lord President of the Council, until on the resignation of Mr. Anthony Eden he became Foreign Secretary (Feb. 25, 1938). There was little criticism of the last appointment, except on the ground of the alleged undesirability of the chief of the Foreign Office being in the Lords.

Before becoming Foreign Secretary Viscount Halifax, in Nov. 1937, visited Germany and had long conversations with Herr Hitler, Baron von Neurath, and General Göring. Speaking in the House of Lords on March 16 shortly after the *Anschluss*, he said: "First, I would say that we must seek, in the face of the present situation, so to conduct our foreign policy that it may deserve and command the support in this country of a united people and in the Dominions of a united Empire. Secondly, while relaxing no exertion in pursuit of real peace wherever it may be found, it must be our purpose to reassert the claims of international law as opposed to the exercise of force in the settlement of international disputes. . . . Next, we must do everything to bring it about that means should be devised . . . to direct the minds of nations to the removal of injustices as much as to the maintenance of peace. And lastly, this country must for the fulfilment of these purposes show itself prepared not only by way of material and equipment but in the spirit, discipline, and determination of our people".

HANKEY, COL. SIR MAURICE PASCHAL ALERS, G.C.B. (1877–), British ex-civil servant, was educated at Rugby, held his first commission (1895) in the Royal Marine Artillery, and in 1902 was transferred by Admiral Sir John (Lord) Fisher to the naval intelligence department at the Admiralty; in Jan. 1908 he was appointed assistant secretary of the committee of imperial defence, and, in March 1912, promoted to secretary. On the outbreak of the World War he became secretary of the war council, and in 1916 head of the secretariat of the newly formed war cabinet; he was also secretary to the imperial war cabinet, and after the armistice acted as British secretary at the Paris Peace Conference.

When the war cabinet was dissolved in 1919 Sir Maurice, while still secretary of the committee of imperial defence, became secretary to the cabinet, and in 1923 added to these posts the office of Clerk of the Privy Council, having meanwhile been secretary to the Imperial Conference of 1921 and to the British delegation at the Washington Conference of 1922. In July 1938, he resigned his offices to join the board of directors of the Suez Canal as one of the government's representatives.

Sir Maurice is married and has three sons and one daughter. K.C.B. in 1916, he was advanced to G.C.B. in 1919, when he received the thanks of both Houses of Parliament and a grant of £25,000; he was created G.C.M.G. in 1929 and G.C.V.O. in 1934.

HARBOURS: *see* DOCKS AND HARBOURS.

HATAY, THE. On Nov. 29, 1937, there came into force the statute and basic law whereby the Sanjak of Alexandretta was endowed with a political, administrative, and judicial machinery compatible with the exercise of the French mandate.

In conformance with the decisions of the League of Nations, the Sanjak was constituted as a separate entity from Syria, and could form the subject of no international decision without the previous formal consent of the League of Nations. Turkish and Arabic became the official languages. The Sanjak was demilitarized, with a police force of 1,500, but France and Turkey gave a joint guarantee of its territorial integrity. It was to be the duty of a League of Nations delegate, of French nationality and possessing the right of veto, to ensure that the new regime was respected.

The new regime was very badly received by Syrian and Turkish public opinion, and was only poorly defended in France. The Turkish government broke off relations with the League of Nations Commission whose duty it was to arrange the elections, and the Commission then asked, on June 24, to be relieved of its mandate, the fulfilment of which was rendered particularly difficult by the attitude of the French authorities in the Sanjak in relation to non-Turks.

France and Turkey entered into direct negotiations, which resulted in the signature at Ankara on July 1 of a treaty of friendship and a military protocol. This agreement was to the advantage of the Turks, who at once proceeded, on July 5, to put an armed force of 1,500, equal to the French force, into the Sanjak.

The official electoral rolls on Aug. 3, 1938, showed 35,847 electors from the Turkish communities, 11,319 Alouites, 5,504 Armenians, 1,845 Arabs, and 2,098 Orthodox Greeks. In the elections on Aug. 21, the Turks obtained 22 seats out of forty.

The new Assembly met at Antioch on Sept. 2, 1938. M. Tayfour Seukmen was elected President of the new state (which was given the name of the Hatay), M. Abdul Gani Turkmen President of the Assembly, and Dr. Abdulraman Malek Prime Minister. All these ministers are Turks.

The Assembly adopted a flag, which is the same as the Turkish flag except that the star, instead of being represented *en bloc*, is shown only in white outline.

Since then the Turkification of the Hatay has been actively carried out. Christian and Syrian officials have been dismissed, the Turkish language has been taught and used at the expense of Arabic, the battalion of footguards and the two squadrons of horseguards have been reorganized, and demonstrations have taken place in favour of Ankara. In short, the Hatay must in future be looked upon as practically a Turkish province.

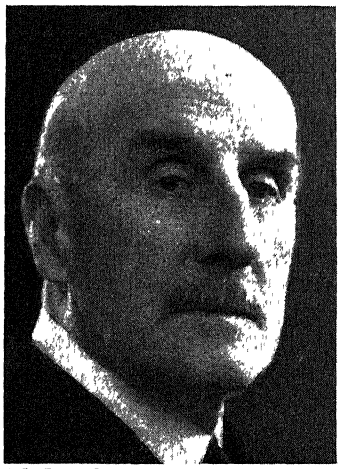
This situation has had profound repercussions in Syria, especially among the Christians of the High Jazirah and of Lebanon, who have been deeply disturbed by the attitude of France.

(C. A. J.)

Area and Population:

Area 1,930 sq. miles.
Population *c.* 228,000 (Turks, 85,000; Alouites, 62,000; Christians, 49,000; Sunnite Arabs, 22,500).
Chief Towns: Antioch, Alexandretta.
President. M. Tayfour Seukmen.

Language. Turkish (chief official).
Religions. Mohammedan and Christian.
Flag. A white crescent and a star (outlined in white) on a red background.



HAWAII. The U.S. Territory of Hawaii consists of a group of eight larger islands (Hawaii, Kahoolawe, Maui, Lanai, Molokai, Oahu, Kauai, Niihau) and numerous islets including Midway (*q.v.*) and Palmyra in the Pacific ocean. Their total area is 6,438 sq. miles. The capital is Honolulu, on the island of Oahu. It is a completely modern city with a population (1930 census) of 137,582. Oahu is the scene of the United States' strongest fortifications in the Pacific Hawaii's population, 368,336 in the 1930 census, is estimated at approximately 412,000 in 1938. The racial origin of this population, in addition to the native Hawaiians and Caucasians from the mainland, is Japanese, Chinese, Korean, Filipino, Portuguese, with 81 per cent native born; immigration into the Territory, except for citizens from the American mainland, has ceased.

The governor and Territorial secretary are appointed by the president. Otherwise the Territory is wholly self-governing. It elects to Congress every two years a delegate who has a voice in the House of Representatives but no vote. The governor in 1938 was Joseph B. Poindexter; and the delegate, Samuel W. King. The Territory collected in taxes and fees $12,722,141 in 1938 and expended $11,656,721. In addition, Federal taxes were paid into the U.S. Treasury of $14,286,656 20, exceeding the payment of seventeen States of the Union.

Agriculture. Hawaii's chief crops are sugar and pineapples. The value of the 1937 sugar shipments was $63,575,478. The pineapple industry, next in importance, reached in 1937 a maximum of 879,641,271 lb. with a value of $59,395,090. Other agricultural crops are coffee, macadamia nuts, papayas, and taro, a root used by the natives in making the native "poi" and also now being processed into flour.

The tourist industry has developed rapidly in the last two decades, there being a total of 53,938 tourist visitors in 1938.

HAWKE, MARTIN BLADEN HAWKE, SEVENTH BARON, English cricketer, was born in Lincolnshire on Aug 16, 1860, and died in Edinburgh on Oct. 10, 1938. He played cricket for Eton, and, in 1882, 1883, and 1885, for Cambridge against Oxford, being captain in 1885. He was a competent, though not an outstanding, batsman; but his great service to cricket was rendered by his brilliant captaincy of the Yorkshire County Cricket Club from 1883 until 1910. His cricketing tours included one in Australia, interrupted by his father's death, two each in the U.S.A. and Canada and in South Africa, and one each in India, New Zealand, and South America. Lord Hawke was president of the M.C.C. from 1914 to 1918, and was several times a member of the test match selection sub-committee. He succeeded his father in 1887, and is succeeded by his brother, Edward Julian Hawke.

P.P. Bureau]
LORD HAWKE

HAY FEVER: *see* EAR, NOSE, AND THROAT, DISEASES OF.

HEART AND HEART DISEASES. During 1938 there was a steady advance in the development of methods of study of the heart, with a notable announcement concerning the experimental production of serious disease of the coronary arteries (that supply the heart muscle with oxygen and nutriment). This significant discovery was unexpectedly made some years ago during a research on the effect of nerve imbalance due to excessive parasympathetic (vagus) stimulation on the gastro-intestinal tract of chickens and dogs; its importance was at once realized, and for years an intensive research has been carried on, the results of which are now being reported. Dr. George Hall, of the Banting Institute in Toronto, was able in every instance to produce extensive coronary disease with thrombosis in healthy young dogs by the repeated daily injection over periods of weeks to months of acetylcholine (the chemical substance liberated by parasympathetic or vagal nerve stimulation, antagonistic to sympathin and adrenalin produced by sympathetic nerve stimulation). Repeated vagal stimulation during many hours will cause temporary changes in the electrocardiogram which indicate a passing effect (as from coronary spasm) which, if it could be repeated long enough, might lead to the same changes produced by the acetylcholine. Some of the animals actually died of the heart disease, a condition which is not normally found in dogs even much older than those tested; only two of sixty old dogs studied as controls showed even a slight degree of coronary disease. It was of interest that the change was mostly in the media (muscle layer) of the dogs' coronary arteries, while it was in the intima (internal coat) in the case of rats, showing the selective effect according to species. It was also of special interest that the regular administration of atropine (which paralyses the vagus and so neutralizes the action of acetylcholine) or adrenalin (which combats the parasympathetic effect) wholly protected the animals from the deleterious effect of the acetylcholine. Although Dr. Hall has wisely refused to commit himself as to the mechanism of the process or as to its implications in human disease, this discovery naturally raises the question of nerve imbalance and nerve strain, as one possible factor, at least, in the production of this most important cause of heart disease in man, shifting interest somewhat from the theory of a primary fault in cholesterol fat metabolism.

Meanwhile, coronary disease of all grades is coming to light more and more frequently as it is being sought for, especially by electrocardiogram, so that now it outranks the two other common types of heart disease, hypertensive and rheumatic, while syphilis as a cause fortunately ranks but a poor fourth in most countries of the temperate zone. Slight degrees of coronary arteriosclerosis are, in fact, so common that the diagnoses of angina pectoris and coronary thrombosis (occlusion of a coronary artery by a blood clot) possess no longer the sinister significance ascribed to them even as recently as a decade or two ago. Not only may these conditions be of slight degree during their acute phases, but they frequently clear up entirely so far as any clinical evidence is concerned. Symptoms may disappear, the heart seem entirely normal on physical examination and by X-ray, and even the delicate test of electrocardiography may reveal nothing despite the existence of a small scar in the heart muscle (healed myocardial infarct), or of calcified coronary arteries years after an acute illness of cardiac nature. Thus, it has become very important to distinguish between the immediate and ultimate prognoses

in heart disease, particularly during episodes of coronary insufficiency (as indicated by angina pectoris) or of actual coronary occlusion (chiefly thrombosis). The designation "*permanent* total disability" is not justified during such an acute illness, for even a very sick man may recover in a few months to live many years of a healthy and useful existence. Survivals in proved cases are already on record of eighteen up to 25 years after the occurrence of coronary thrombosis. Much cardiac neurosis, unjustified invalidism, and abuse of disability insurance have resulted in many cases from the old views of coronary disease. Although it is true that prognosis in coronary disease remains as one of the most difficult problems in the practice of medicine, the recent important advance in our knowledge as stated above is a long step forward

The treatment of coronary disease has also advanced to the extent of our recognition of the remarkably ability of nature to restore an adequate coronary circulation, no matter what we do or what medicines we give, making one sceptical of every new "cure" that is heralded abroad. Proper periods of rest, regulation of life and habits, and cultivation of a sensible calm state of mind are as yet superior, except in rare cases, to all the radical treatment by strong medicines, physical therapy, nerve injection, and operations, which have been introduced in recent years to include such radical measures as: (1) total removal of the thyroid gland to reduce the work of the heart muscle, and (2) attaching chest muscle, omentum, or lung to the heart to bring it new blood supply.

Congenital anomalies of the heart, an uncommon type of heart disease (about two per cent of heart cases), have always been the most difficult to analyse accurately as to the structural defects present, partly because of the extraordinary variety of combinations of the many defects that is found, and partly because only recently has a widespread interest in the condition been established in clinics through the stimulating influence of Dr. Maude Abbott of Montreal. Now every year new clinical diagnostic criteria of various congenital anomalies are being presented.

An important advance in methods of study should also be noted; this should prove helpful both in physiological and anatomical research and also in the analysis of difficult clinical cases. It is the X-ray visualization of the individual heart chambers and great vessels by the injection of diodrast into an arm vein followed by the taking of X-ray films at intervals of a few seconds afterwards to trace the course of this substance through the heart.

HEBREW LITERATURE. Modern or secular Hebrew Literature, which began its existence in Germany and Austria in the middle of the eighteenth century, has witnessed in the post-war period a very great development. The internal changes of Russia after the establishment of its Soviet regime made it impossible, with serious consequences for Hebrew literature, for Russian Jewry, to whom the "golden age" of pre-war Hebrew literature owes so much, to continue to play their leading role in this field. This great loss had to be made up by the rebuilding of Palestine, where, thanks to the revival of the Hebrew language, modern Hebrew literature is at present in a highly flourishing condition, although suffering under the strain of the events of the last two and a half years. There are also smaller centres of activity of modern Hebrew literature in the Jewish Diaspora, *i.e* outside Palestine, mainly in Poland and in the U.S A.

Hebrew literature comprises at present almost every branch of literary activity of whatsoever national and public interest. Its most characteristic expression it finds in poetry and belles-lettres. Both general human themes and those of peculiar Jewish content, drawn from Jewish life in the Diaspora and Palestine, are dealt with in the modern Hebrew novel, which on the whole tends to be realistic, and often psychological The historic novel, dealing especially with topics of the Jewish past, biblical and post-biblical, has also found its exponents in modern Hebrew literature. The drama has not been developed to the same extent as poetry and prose, although the building up of the modern Hebrew Theatre ("Habimah", "Ohel", etc.) has fostered the dramatic branch of modern Hebrew literature Literary criticism is also alive in modern Hebrew literature. Essays on speculative, national, and political problems have become a favourite form of expression. One of the best modern Hebrew essayists was Ahad Ha'am. Scholarly research into general and Jewish History, Philosophy, Religion, Philology, and various natural sciences has been greatly enriched in modern Hebrew literature in recent years. Many of the pivotal classical and modern works have been in recent years translated into Hebrew, particular interest being taken in translations from English literature (from Shakespeare, Dickens, and Scott, to G. B. Shaw and Wells). Many modern English and American famous best-sellers have found their way into modern Hebrew.

One of the most flourishing branches of modern Hebrew literature is its periodical Press—once much cultivated in pre-war Russia and at present concentrated in Palestine—the various organs of which cover almost every aspect of Jewish life and spiritual interest. The activity of modern Hebrew literature in recent years has on the whole demonstrated that Hebrew has become more and more a modern living language, and its revival is one of the greatest achievements of modern Jewry.
